

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

Che Outlook

SATURDAY, JANUARY 6, 1906

If the Tammany boss Mayor McClellan's and district leaders **Appointments** are to control the

coming administration of Mayor McClellan in New York, the fact does not appear in the Mayor's appointments. Reports of Tammany rage and resentment against Mr. McClellan may be exaggerated, but they are not incred-The Tammany doctrine that public office is a piece of property which by right belongs to the man who works for a successful political organization Mr. McClellan has apparently disregarded. For Police Commissioner he has selected an army officer not a Democrat. not even a resident of New York In making General Theodore A. Bingham head of the police he has indicated his determination to use the police force as an instrument, not for party reward, but for public service. Whether General Bingham can possibly avoid the serious difficulties, not to say failures, of his honest and courageous predecessor, Mr. McAdoo, is another question. The anomaly of a temporary head of a permanent body is one that may frustrate the best plans of the most efficient man. Messrs. Oakley, Featherson, and Best, heads respectively of the water and lighting, of the dock, and of the bridge departments, Mr. McClellan has had the courage to let go, in spite of their very powerful political influence, and in their places has put men of good reputation-Messrs. Ellison, Bensel, and Stevenson. The reappointment of the present Commissioner of Street-Cleaning, Tenement-House Commissioner, and Health Commissioner may be regarded as deserved. Whether the new Fire Commissioner, Mr. O'Brien, formerly the Mayor's secretary, proves efficient or not, he owes his appointment to the Mayor's personal confidence in him, not to political "pull." It is evident that Mr. McClellan has

decided that he will put the Democratic party above the Tammany organization, and in at least one critical position the city above his party. He has decided to do this at the risk of alienating valuable support in the Board of Estimate and Apportionment, which holds the power of the purse, and of arousing the hostility of the most powerful of his erstwhile supporters. The Outlook hopes that the subordinate places in the city government will now be filled in no less. high-minded manner.

in New York City

The Traction Merger week the purchase of We reported last the surface railways

of New York City by the capitalists who now control the elevated and subway systems. This transaction proves to be rather a merger of the two, and is founded on a stock-watering operation of gigantic proportions. The figures are thus given by the New York "Evening Post," the comments of which are the more significant since no one will suspect that journal of anti-capitalistic sympathies:

The full plan of combination of the Belmont and Ryan traction interests is now It contemplates turning the presbefore us. ent \$30,000,000 Interborough stock into \$70,-000,000 bonds, with a "bonus" of \$31,500,000 in new stock; converting the \$52,000,000 outstanding Metropolitan Street Railway stock into \$78,000,000 new stock, and buying up the stock of the old "holding company" with stock of a new one. This is, clearly enough, a stock-watering plan on the scale of 1901. We are not likely to hear again very soon the assertion which the Subway's financial managers have been wont to make with pride, that here at least is a railway enterprise in which capital inflation has played no part. The new plan, if carried out successfully, will change all that, and will change it on much the same lines as Jay Gould selected, a generation ago, for watering the stock of the Elevated Railway.

We naturally turn to the New York "Times" to find what defense there is

Digitized by Google

for this stock-watering operation. Its defense is mainly silence; perhaps it regards the figures as part of the news not "fit to print;" the only editorial reference we find to it is in the following sentence: "It must be plain to every man's understanding that the capitalization of the new concern is based on an expectation of largely increased business—of carrying more passengers."

Monopolistic or

It must also be plain to every man's under-Municipal Control standing that if this expectation is not realized, it will not be the men who have issued the stock who will suffer from the "great expectations." It will be either the stockholders—many of them innocent purchasers—who will go without their dividends, or the employees whose wages will be reduced because the enterprise does not "pay." In any case. the public will pay for the service more than a fair interest on the actual cost of constructing the new railways. It is because this is plain to men of understanding that the Rapid Transit Commission are preparing to meet the merger with wise plans for preventing the city from being at the mercy of a monopoly. For this two methods are proposed. The first is an endeavor to secure a new combination of capitalists to bid against the monopoly and so enable the city to secure fair terms for the franchises it is to grant. There seems to be good prospect that they will secure such inde-The other method is thus pendent bids. stated by Mr. Charles Stewart Smith, who we may well believe represents the views of the Rapid Transit Commission:

In the subway situation the city will not seek to enter the field of municipal construction and operation unless it is compelled to do so. However, if the Belmont-Ryan interests do not offer terms adequate for the valuable right they want, then it becomes the imperative duty of the city not only to own the new subways, but also to build them and run them when built. Should we be brought face to face with such a condition, the city will be found abundantly able and willing to construct, and to operate as well.

For this purpose an appeal will probably be made to the State Legislature to propose an amendment to the Constitution enabling the city to add to its borrowing capacity by borrowing on its incomeproducing property, which now it cannot As Mr. Coler has explained in The Outlook, under present conditions the richer the city is the less it can borrow. Two years would be sufficient to secure such an amendment. With such an amendment it could borrow all the money that is needful, and meanwhile it could, if necessary, borrow enough to make a beginning in subway construction. It looks as though the merger, which was intended to put the city under the control of a monopoly, might give municipal ownership a new impulse.

The New York The End of the Insurance Inves-Insurance Investigation tigating Commit-

tee finished its sessions for the taking of testimony last week. There are before it, however, several weeks of hard work in preparing its final report and its recommendations for legislation. Mr. John C. McCall, the Secretary of the New York Life Insurance Company, presented the most interesting testimony of the last days. Mr. McCall had been sent to Paris by the trustees of the Company to obtain a statement from Mr. Andrew C. Hamilton, who had been its representative in matters relating to legislation and taxation, of the manner in which he had spent the large sums of money which the Company had paid him from time to time. Mr. Hamilton was found by Mr. McCall in a precarious condition of health, which made it impossible for him to return to appear before the Committee in person. He did, however, prepare a statement which was presented to the Committee. In it Mr. Hamilton presented a long explanation of the reasons which led the New York Life, in co-operation with the Equitable and the Mutual, to organize a secret legislative bureau to protect the companies from legislation which the officials regarded as inimical to the interests of the companies and to aid in securing favorable legislation. He asserted that secrecy was essential to the success of the work of the bureau, secrecy not only from the public but from the officials of the companies themselves. He had gone into the work with the distinct understanding that he was not to be called upon to account to the companies by detailed statements as to who his representatives were and how much he paid them. He had, therefore, kept no books showing his expenditures, had demanded no vouchers from the men he employed, and had made his payments, not by his personal checks, but by cash, drafts, and certificates. He declined to give the names of any of his representatives. He submitted a statement of the amounts which he had expended on behalf of the New York Life alone since 1899, grouped under very general heads. The aggregate amounted to \$720,550, of which \$160,000 was his personal compensation, \$34,000 was for rent and clerk hire, \$74,000 was for traveling expenses for himself and his representatives, and \$451,000 was for retainers and fees for his representatives and for newspaper articles. The largest yearly expenses were during 1904 and 1905, amounting to \$142,000 and \$147,000 respectively. The size of these amounts was explained as being due in the former case to large expenditures in an attempt to create a public sentiment throughout the country in favor of Federal supervision of life insurance, and in the latter to increased activity in legislation due to the troubles in the Equitable Life Assurance Society, and to the fact that the bureau in that year was practically carried on by the New York Life and the Mutual without material assistance from the Equitable. With regard to the sum of \$235,000 charged against him on the books of the New York Life Insurance Company, concerning which inquiry had been especially made, Mr. Hamilton stated that the discharge of obligations incurred during the past two years, not included in the payments shown in his statement, and his own unsettled accounts for retainers, commissions, and percentages, would account for a large portion of it. As an evidence of good faith, however, he offered to place in the custody of the company the sum of one hundred thousand dollars, to be held subject to a future audit and settlement of these accounts. Mr. McCall testified that he had not asked Mr. Hamilton for

an accounting of any particular sum, that he had accepted whatever Mr. Hamilton gave him, and that he was not aware that he had not received an accounting for "every dollar he had ever had from the New York Life Insurance Company." He could give no explanation of the discrepancy of \$45,000 shown to exist between the money which Mr. Hamilton had received and the money for which he had accounted. Mr. John A. McCall, the President of the New York Life Insurance Company, is reported to have said that the statement was "very satisfactory," and that he regarded it as a "very good report." It is extremely doubtful if the policyholders of the New York Life will share Mr. McCall's opinion.

Mr. Richard Wightman,

Life Insurance

the President of the Life Without Agents Insurance Club of New York, testified that several years ago he conceived the plan of writing life insurance by advertising followed by correspondence, without the intervention of agents. He made a contract with the New York Life Insurance Company, and by means of advertising he obtained in three months a larger number of policies than any other agent of the Company, although not a larger volume of business. His contract was then terminated by the Company on the ground that its terms had been violated by him; but he testified that he had never been able to find out in what the violation consisted. His contract with the New York Life was on a commission basis, and during his connection with the Company he found that the cost to him of writing a policy was fifteen dollars, and that his commissions from the Company on such a policy amounted to about sixty-five dollars per thousand. If he wrote a policy of one thousand dollars, his profit amounted to fifty dollars, while if he wrote a policy of five thousand dollars his profit amounted to three hundred and ten dollars. the termination of his contract with the New York Life, Mr. Wightman formed connection with the Reliance Life Insurance Company, of Pittsburg. this time a combination was formed by

the Equitable, Mutual, and Prudential Life Insurance Companies to prevent Mr. Wightman's advertisements from These appearing in the magazines. companies informed certain publishers that if Mr. Wightman's advertising was carried theirs would be discontinued, and offered to other publishers large advertising contracts if his advertising should be refused. Their opposition was based on the ground that Mr. Wightman did not mention in his advertising the name of the company that would write the policy. Mr. Wightman testified that he was unwilling to do this for the reason that it would weaken the force of the club idea which he was carrying out in his advertising. As a result of this opposition he was led to form the Life Insurance Club of New York, which has been in existence for about a year. This Club writes life insurance entirely by advertising and correspondence, and employs no agents. Mr. Wightman testified that the premiums charged by his company at most ages and on most forms of insurance average ten per cent, lower than the premiums charged by other companies, and that the saving to a policy-holder on a twenty-payment policy would amount to about the sum of three annual premiums. He believed that this saving would be increased by the payment of larger dividends than is the custom in other companies, made possible by the economies resulting from a discontinuance of the agency system.

There has been no abate-Affairs in ment of the reform move-Philadelphia ment in Philadelphia since the November election. Mayor Weaver and his colleagues have gone steadily forward with their work, and although developments have been less sensational in their features, they have been none the less important and satisfactory for that reason. The officials elected in November have announced their appointments, which seem to give very general approval. Some old and tried officials have been retained, but the bulk are new ones, selected, according to the statement of the Chairman of the City Party

Committee, "from among the mass of excellent material," and the prospect is that "these offices will be administered with a simple view to the public service." At one time it looked as if the officials elect and the City party leaders would be overwhelmed with applicants for place; but the dangers of the situation have been successfully passed. punishment of ballot frauds proceeds satisfactorily. The courts have directed in some cases the opening of the ballotboxes, and thus enabled the District Attorney to corroborate his other testimony. The members of the whole election board in a Fourteenth Ward division and the "boss" of the division were convicted (or pleaded guilty) of stuffing the ballot-box to the extent of two hundred ballots. They received two years each, the maximum penalty. In sentencing the prisoners the judge declared:

I see no reason why mercy should be extended in this case to any of the defendants except Williams. The men have been convicted or have pleaded guilty to a gross offense against the laws of the Commonwealth -an offense which I regard as so grave as to call for punishment to the fullest extent. A few days later the election officers of a Seventh Ward division pleaded guilty to stuffing the ballot-box to the extent of scores of fraudulent votes. In a Fifteenth Ward case the opening of the ballot-box by the court commissioner disclosed that although forty-four straight City party votes had been cast, but thirteen had been returned, and that the box had been stuffed to the extent of two hundred fraudulent votes. These cases afford interesting evidence as to how the "organization" has been able to maintain its control of Philadelphia politics. Preparations for the special session of the Legislature which meets January 15 are nearly completed. The Personal Registration Bill, prepared by the Election Reforms Committee, has been gone over most carefully, and, when introduced by Representative Sheatz (who introduced it at the regular session, where it received such scant consideration), will represent the views of all the forces interested in its passage. It will be given the united support of all the reform forces. The "ripper" repeals have been prepared by the Committee

of Seventy, and the apportionment bills by the Philadelphia City Club, and will, like the registration bill, represent the combined forces. Bills to carry out the other reforms made possible by Governor Pennypacker's call are being drafted, including treasury reform. No legislator will be given a chance to say that there was no disposition to accept the opportunity offered, as every point will be covered by a carefully prepared measure. If the members of the Legislature are sincere, they will have no trouble in giving effect to the demands of the voters, and they will be able to adjourn within the two weeks which Governor Pennypacker has indicated as being necessary to carry out the recommendations of his message. He has not given any intimation of his intention to enlarge the call for the special session and include ballot reform and uniform primaries.

A Municipal Experiment

The city of Houston in Texas has for the last half-year been carrying on an ex-

tremely interesting experiment in municipal government. Its chief feature is the concentration of power in the hands of the Mayor and four Commissioners who act as his assistants, and who combinedly have a certain degree of checking power on the Mayor's actions, but only in a few specified matters, mainly relating to expenditures. The new form of govemment was established by a charter granted by the Legislature, and the idea was in part inspired by the effective methods of the Commission under which the city of Galveston had spent millions for improvements and the re-establishing of all that had been destroyed by the great flood. The central aim of Houston's new charter is concentration of power in the hands of the Mayor, with direct responsibility from him co-extensive with this power. Only four city officers are chosen by popular votenamely, the Mayor and four Aldermen at large, who are at once appointed by the Mayor as Commissioners, respectively, of taxes and finance; police, fire, and electricity; streets and bridges; sewers, parks, water, and public health. The Mayor has absolute power of removal of all non-elective officials and employees, including the Tax Collector, the Chief of Police, the Judge of the Corporation Court, the City Attorney, and the City Comptroller. The Mayor and the four Aldermen constitute the City Council, and this Council may impeach and remove the Mayor or any other of its own members for any cause affecting his efficiency and honesty. A referendum upon the granting of a franchise may be had whenever five hundred qualified voters ask for it. It will be seen that this form of municipal government combines the advantages of home rule and of direct responsibility by the few elective officers. Theoretically, it will. not please those who believe that minor. officials should be chosen directly by the people and be removed only after tedious litigation before the courts. belief is gaining ground, however, among advocates of municipal reform that, while all power must come from the people at . large, it should be so applied as to bring about actual executive efficiency: the dissipation of the elective choice among a multitude of only slightly responsible officials is obviously without economy in power and extremely likely to make. the punishment of incompetent or corrupt minor officials almost impossible. The actual working of the Houston experiment has been excellent. A special article in the Boston "Transcript" from. its correspondent in Houston declares that "the public is well pleased with the experiment." He adds:

The period has been meteoric in respect to new policies which have taken the place of aged ones. The five commission officials have used their power freely, and they have brought about a new order of things. They have shaken loose many of the barnacles of maladministration, and plugged leak-holes of extravagance and graft. The new set of officials, while enjoying an unusual scope of power under the charter, are more than ever under the eye of the public, and their acts capable of being more openly viewed.

The Demands of the Anthracite Mine Workers The adjournment of the Shamokin Convention of the anthracite mine employees

on December 16 without formulating for the public the demands the United

Mine Workers of America are to make upon the hard-coal operators, is a step in diplomacy which seeks to secure an arrangement whereby wages and conditions of employment in that industry will not be left in uncertainty upon the expiration of the Anthracite Coal Strike Commission's award on March 31, 1906. Unless some provision be made prior to that date, the present Anthracite Board of Conciliation, which the Commission's award created, and which has had control for the past three years over general labor conditions in the hard-coal fields, goes out of existence. Such a contingency must be guarded against, and the mine workers are simply showing foresight in protecting their interests by their organized activity at this time. By the action of their Convention in placing the whole subject in the hands of a committee, the anthracite mine employees have committed their interests to the National and district officers of the United Mine Workers of America, and in particular to the hands of their National president. John Mitchell, These officials will at once, if they have not already done so, enter into correspondence with the presidents of the anthracite-carrying railroads in an endeavor to come to some kind of a mutual understanding. While the Shamokin Convention did not make public the demands of the hard-coal mine employees, the more important of these are known to be recognition of the union and the eight-hour work day. These issues are by no means new ones, having been conspicuous in one form or another in both the strike of 1900 and that of 1902. Recognition of the union is the one issue which includes all the others that the United Mine Workers have been striving to secure ever since the entrance of this organization into the anthracite region in 1898, and it is the one issue which strikes at the root of all the differences which separate the operators and the labor union officials.

a

Moderation
Desirable

We believe that recognition of the Union is for the best interests of employers, employees, and the general public; but we are not less convinced that the officials

of the mine workers' union will go contrary to their best interests, as interpreted by their friends, if they insist upon a further and formal recognition, at this time, to the point of a strike. In an industrial struggle for such an object the mine employees will not have the sympathy and support of the public, which was a determining factor in their favor in both recent strikes, because the general public will not support a demand for the establishment of this broad industrial principle unless specific grievances embodying this principle are brought home to the public's sense of fair play and justice, which it is thought by good judges cannot be successfully done at this time. But there is an even stronger reason why this issue should not be forced to a final decision at this Practical recognition of the United Mine Workers has already been secured by the three district presidents of this organization in the three anthracite fields being members of the Board of Conciliation, as was pointed out in the article by a special contributor to our issue of December 16. The existence of this Board in itself more than half-way establishes recognition as meant by the union's joint-conference plan between operators and mine workers, and is about as near to the trade agreement as it is possible to approach without merging into the latter. Having already, within six years, secured so many of those objects for which the United Mine Workers of America is organized, its officials should, and we trust will, be careful to guard safely that which they have rather than risk it all in reaching out to secure more of their demands. The United Mine Workers have the Anthracite Board of Conciliation, upon which they have equal represention with the operators, and they would be in danger of losing this substance of recognition if they should reach out for its shadow. The recognition which they have may not look as large as that complete joint-conference recognition which produces the trade agreement, but it is recognition, and should in time, if made to work to the welfare of the industry, grow into the joint-conference organization. We believe the public can be

depended upon to lend its influence in support of efforts which will continue in operation the Anthracite Board of Conciliation.

Some time ago Mr. William J. Diplomatic Bryan asked to appear before Reform the Committee on Foreign Affairs of the House of Representatives. The request was, of course, promptly granted. The result was a pleasant, intelligent, and informative statement from Mr. Bryan advocating the purchase of proper sites and buildings for the use of American embassies in foreign capitals. As, in common with many others, Mr. Bryan had long been credited with contrary views, his patriotic action was an indication of the growth of a general feeling throughout the country that such sites and buildings are required for the dignity of the Nation and its representatives. Evidences of this feeling are now at hand in the measures just introduced in Congress by Representatives James Breck Perkins, of New York, and Nicholas Longworth, of Ohio. The first bill of the former authorizes the Secretary of State to purchase a proper site and building in London for the American embassy, at a cost not to exceed \$400,-000. The text of the second bill is like the first, save that "Paris" replaces "London," Mr. Longworth's bill provides for a considerably greater maximum expenditure, namely, for the purchase at a cost of not over \$5,000,000 of buildings for American missions at foreign capitals.

We hope, however, that The Longworth the Longworth bill will meet with the favor of Congress. Something should be done, and done promptly, to remove the apparently necessary qualification of great wealth for the holding of ambassadorial office under our Government. Ambassadors receive such small salaries as compared with the salaries paid by other countries that none but rich men can aspire to American ambassadorial position. We have as a case in point the offer by President McKinley of a high ambassadorship to a man of distinguished learning, experience, capac-

ity, and character, who was obliged to refuse it solely because of the inability to maintain a proper establishment on the salary received. In Washington there has been little evidence of each British Ambassador's particular wealth, because the same building, owned by the British Government, has been occupied by all. So, in our case, if a suitable official residence were given to each of our diplomatic envoys, then, at least so far as such an external appearance is concerned, rich and poor appointees would appear more nearly alike. This is Mr. Longworth's motive in proposing his measure; it provides not only for our Ambassadors but also for some of our Ministers: it is essentially a measure in the interest of democratic representation

The new British Premier, The Liberal Sir Henry Campbell-Ban-Programme nerman, has confirmed at almost every point the Liberal programme which The Outlook ventured to outline two weeks ago. In an address at Albert Hall he spoke with an apparent candor and sincerity which greatly impressed his audience and have created an impression throughout the country. After the brilliant finesse, intellectual subtlety, and wonderful verbal dexterity of Mr. Balfour, one of the most accomplished men of his generation, the straightforward simplicity and plainness of speech of the new Premier will be a relief to the British public, which is always a little suspicious of brilliant The Liberal programme as outlined by the Premier rests chiefly on uncompromising maintenance of the British free-trade policy. At this point, if the Liberals can have their way, the coming political battle is to be fought; for upon this ground all Liberals, whatever their differences on other points, stand as a unit. The Premier also announces that an endeavor will be made to reverse the Transvaal Chinese coolie policy, in which the Liberals will have a great and enthusiastic following among the best people in England; the supremacy of the civil over the military government in India; the maintenance of the alliance with Japan and of the close rela-

tions now existing with France, both of which are very popular and constitute probably the most valuable achievements of the late Conservative Government: the lessening of military expenses, and, in consequence, the reduction of the burden of taxation. The only political question with which the Liberals will have to deal to which the Premier did . not give a decisive and definite answer was the Irish question. He went so far as to say that the Government would favor the granting to the Irish of larger opportunities of self-government, but he defined neither the time, the manner, nor the extent to which this policy will be applied. He has not evaded this question, however, and in a later speech at Dunfermline he stated his general attitude very clearly: "Any legislative body for Ireland that we ever supported was to be subordinate to the imperial Parliament."

As reported in The Outlook The Moscow last week, the second gen-Revolution eral Russian industrial strike culminated in grave disorders at Moscow. During the week which has since elapsed these disorders resulted in a terrible destruction of life. sands of men, women, and children have been killed and other thousands wounded. At the end of last week it was believed that the revolt had been practically broken, although desultory firing continues. One fact seems now establishedthat some members of the fighting organization of the German and other foreign Socialists have gone to Russia and have been instructing the revolutionists there in the use of arms, the art of constructing barricades, and the manufacture of bombs. This calls attention to the four component parts of the revolutionary side of last week's struggle—the Socialists, who apparently want the destruction of all things; the industrial workmen, who want proximately better wages and ultimately proper political control; the peasants of the surrounding country, whose one idea seems to be to obtain possession of the crown lands; and, finally, those of the so-called "intellectuals" who stand behind the student movement, which, at Kharkov and Kiev, as well as at Moscow,

has been in the very forefront of the fight. Last week's affair also called attention to the fact that the revolutionists had made good use of their instruction from abroad and had started trouble in many places. For the first time, the provinces east of Moscow, in the heart of Russia, are now affected, the peasants and workmen having used bombs and firearms freely. West of Moscow the unrest increases, especially throughout Poland and Lithuania, although Finland to the north has apparently been largely pacified by the autonomy already granted. In southern Russia the authorities seem to have succeeded in checking some of the disorder by wholesale arrests of the ringleaders and the seizure of arms, but the insurrection in the Caucasus shows no signs of losing its strength. It remains to be seen what part the reactionaries have been playing in secretly fomenting the disorders headed by the revolutionists. Meanwhile, the Liberals and Moderates, representing the country's only hope, continue to fight for political reform without anarchic revolution against almost hopeless odds.

Last week the new The New Russian Russian electoral law Electoral Law was proclaimed. By it there is a considerable extension of the suffrage, especially in the cities, where it is made almost universal. It extends the franchise to every owner of real estate paying taxes, persons conducting enterprises for which a license is necessary, persons paying a lodging tax (all limit of rent as a voting qualification being removed), Government workmen (employees in the various departments, in the postal and telegraph offices, and on the railways), and, finally—most significant of all, because chronicling the triumph of a politically neglected classworkmen in mills and factories. This class is to have an elector for every ten thousand men; for instance, in St. Petersburg province the electoral college will contain fourteen peasant electors, twenty-four workmen, and thirty-three landlords. The electoral colleges will be composed of one from each province. While the new law as thus outlined implies a great extension of the provisions of the manifesto of last August, its chief advance lies in the statement that "in view of the fact that some even of the western European countries do not yet possess universal suffrage," and that the Czar will not assume the responsibility of decreeing it, "the ultimate decision must be made by the Duma," or parlia-The Czar promises that a parliamentary election list shall be published forthwith, that the date of the election shall then be announced, and, as soon as the Government receives notification of the election of half of the candidates. the Duma will be convoked. Duma is to make the ultimate decision regarding universal suffrage in Russia. is an indication that the merely advisory body proclaimed in August is to become in some degree a legislative body; indeed, that in principle it may even have some of the powers of a Constituent As-Such a change in the attitude of the Czar and of his chief Minister, if confirmed, would, in our opinion, register the passing of the Russian people from a largely irresponsible to a responsible political position, and the government from an absolute autocracy to a constitutional monarchy.

The flight or disap-President Morales's pearance of the Presi-Flight dent of San Domingo should not, it would appear, affect the treaty between the United States and San Domingo now before the United States for consideration. It might do so were it true that President Morales was the head of a party in his own country which favored this treaty and had given way to political enemies who opposed it. This is not the case; the Vice-President, Mr. Caceres, who is now acting as President, and his supporters in the Dominican Cabinet have taken pains to inform this country that they cordially approve the treaty; and, indeed, it is more than probable that the recent representation to Washington to the effect that the Dominican Congress as well as the President should be consulted as to this treaty was an indication and forerunner of the Political disturbance resulting in the

flight of President Morales. Furthermore, the new situation emphasizes rather than lessens the need of such a treaty whereby stability should be imparted to the finances of San Domingo, satisfactory plans made for meeting the claims of European creditor nations, and the latter kept from taking possession of ports and custom-houses in order to secure their money. It is difficult to explain the cause of President Morales's abdication, because the political status of San Domingo is as intricate as it is devoid of reason. At bottom the strife is one for personal supremacy, and genuine efforts at reform cannot safely be predicated of any of the fac-There are at least three aspirants for the Presidency, each of whom has his party of armed followers, who are guilty of just as great depredations as they dare undertake, and whose ultimate aim is to seize the ports and the capital if opportunity presents, temporary arrangement between San Domingo and the United States whereby American agents have been appointed by the Dominican Government to collect and hold customs dues, with the intention to divide the funds justly between the creditors and administrative needs. makes it improbable that insurgents will interfere with the custom-houses; while, in point of fact, the funds thus collected have been very much larger than the Dominican Government had formerly been able to collect. It seems to be in doubt whether Morales, who evidently found the opposition in his own Cabinet so strong that his control of affairs, and quite possibly his life, were in danger, intends to join one of the other factions, or, as seems more likely, will take the field for himself. Reports at the end of the week assert that the fugitive President has gone north toward Monte Cristi to join a band of partisans under General Rodriguez; but other reports state that he is about fifteen miles west of the city of San Domingo and is actually fighting troops sent out by Caceres. The probability seems to be that earlier reports stating that Morales proposed to join the Jimenistas in opposition to the Horacistas (as the factions of two insurgent leaders are called) and the report

asserting precisely the reverse are both unfounded. The almost burlesque situation as between petty violent and really disreputable bands of insurgents in San Domingo makes it more and more to be feared that interference of some kind from the outside may be necessary.

Four great religious waves Christianity have exercised a marked inin China fluence in China. The first was a new form of Buddhism, which superseded the transmigration and other tenets of an earlier school. The second was the influence of the Nestorian sect which appears to have been a chief factor a thousand years ago in the transformation of Taoism from a magical superstition to an ethical system. The third was the mediæval influence revived by the Jesuits. The fourth is modern Christianity. Notwithstanding many imperfections of which they are each more or less conscious, the Greek, Roman; and Protestant branches of the Christian Church exhibit one common feature in the transformation of China in contrast with other forces. What they do can be definitely pointed out as a real social as well as religious uplift. In this a peculiarly practical and permanent influence has been exerted by the Society for the Diffusion of Christian and General Knowledge among the Chinese. annual report calls attention to certain facts. Christians were the first to translate Chinese literature into European languages-Latin, French, German, English-without which one hemisphere cannot understand the other. Christians were the first to open the best modern schools in the Far East for men and for women. Christians were the first to introduce there the training of medical men on modern lines. Christians were the first to publish magazines in the Far East, commencing with monthlies, these followed by weeklies and Christians were the first to prepare text-books for the use of modern education, indeed to prepare books on general subjects of all kinds; these were the means of setting on foot the great reform movement in China. Finally, in all cases of public calamity, such as

famines, floods, earthquakes, and the like, Christians have always taken the leading part both in raising the funds and in their distribution—a task which, owing to fevers and famines, frequently costs human life. In this enlightened and philanthropic work in China Christians spend millions of dollars annually. Despite these facts, the appalling massacre of missionaries at Lienchau has occurred, due, according to a letter from the Rev. W. D. Noyes, of Canton, "to ignorant men, frenzied by the bad characters of the neighborhood. . . . it is not an indication of the spirit of the population at large." But even if it were, and the whole province of Kwangtung had become suddenly and temporafily atti-Christian and anti-American, it would not prove that the appreciation of Christianity is declining throughout all China.

Reforming. The criticism which has for Football years been directed against Football has culminated this year in an agitation which is bearing already some practical fruit. Last week representatives of nearly seventy colleges and universities, in response to an invitation issued by Chancellor McCracken. of the University of New York, gathered in New York City to initiate some measure of reform. These men had been chosen, not by undergraduates or graduates, but by responsible academic authorities. Among them, however, was no representative of any college now represented on the Rules Committee. This Committee, which has formulated the rules according to which all American colleges have played the game, is a self-perpetuating body. On it are experienced football men from Yale, Princeton, Harvard, Pennsylvania, Cornell, Annapolis, Chicago. Each one of these institutions was invited to join in the conference, but none accepted. For Harvard President Eliot replied that he favored separate action by the individual colleges. President Wilson said in his letter, speaking on behalf of Princeton, "We have, indeed, come to conclusions so definite that we could go into such a conference as that proposed only to urge our own conclusions." The absence, therefore, of representatives from these two universities at any rate was not due to indifference. The conference, after vigorous discussion, chose a committee of seven to co-operate, if permitted, with the present Rules Committee in revising the game, and to urge the production of an "open game," the elimination of rough and brutal playing, the efficient enforcement of rules, and the organization of a permanent body of officials. More important, however, than any specific result is the evidence afforded by this conference that college and university authorities are at last assuming the responsibility for ethical standards in intercollegiate athletics which they ought never to have shirked. When President Hadley in his letter said. "Football at Yale is controlled by graduates, rather than by the faculty," he revealed the cause of most athletic abuses in most colleges. It is to be hoped that football reform will go beyond the rules concerning interference and downs and scrimmages and forward passes, and that it will reach the minds of college professors and instructors.

The South lost one of its Chancellor Hill bravest and sanest leaders last week. Chancellor Walter B. Hill, of the University of Georgia, was eminent among the men whose service to the Nation has been invaluable during these years of reunion. Born in 1851, too late to participate in the war, and yet early enough to know the humiliation that followed the triumph of Northern armies, he knew, as men older and men younger than he were not likely to know, how deep was the pit out of which the South had patiently to drag herself. Trained for the law, he became six years ago the head of the University of which he was a graduate. During these six years he has been far more than a college president; he has been a trainer of the public conscience, an advocate of popular education, an interpreter to the North of the ideals of the South, a happy and energetic contributor to the process by which for a generation the Nation has been finding itself as a Nation. The service he rendered through the Southern Education Board has been invaluable. He had a style distinguished for clearness, and he wrote and spoke with a humor that is too rare among men who recognize, as he did, the seriousness of the problems at which they are working. His death, in middle age, is a severe loss to those forces which, in spite of a surviving unlovely sectionalism, are putting the best qualities of all sections to the Nation's use.

Consular Reform

The consular service is pre-eminently a commercial service. It aids the Nation's foreign trade. It is, in general, rarely to be confounded with diplomacy, in the strict sense of that word, and almost never with politics. It should be organized as a home commercial house would organize its branches abroad.

To be efficient the system needs, first, to be self-respecting. It needs to be divorced from politics. At present an unholy alliance exists between it and politics—the spoils system. "To the victor belong the spoils." A victorious political leader presents his sub-leaders to the President for appointment somewhere, preferably to any comfortable berth in the consular service, not because of any demonstrated competency on their part to perform the duties of a given position in that service, but merely as a haphazard reward for party fidelity. Under these circumstances, no matter how fair to every one a conscientious Executive tries to be, the result is often a misfit; and in some cases our consulates have been disgraced by unworthy men. In any case, however, appointees generally have to learn their business after arriving at their posts abroad, the majority of the appointees not even having a knowledge of the language of the country. Such appointments benefit no one, and are ultimately a source of party weakness rather than of party strength.

Secondly, to be efficient the consular service must be a paying one. It is true that a large income rewards the fortunate holder of some few consular positions, but the average income is

too small. There is not sufficient financial inducement to ambitious young men to enter upon a consular career when most of those now in it are underpaid.

Thirdly, to be efficient, the service should be permanent. The average consular officer regards the retention of his place as conditional upon guarding his political influence at home rather than upon developing his own efficiency abroad. Hence the protection of the home influence becomes the consul's first interest, the promotion of trade abroad a secondary consideration. Instead of being bound to such an absurd system, so long as he gives evidence of good behavior, the American consular officer should be sure of retention in office, and on evidence of marked merit he should have a right to expect advancement. Our consular service should be what it has never been, a career; and to be that it must be self-respecting, paying, and permanent.

This is not saying that it is not now better than it has been. After Mr. Hay became Secretary of State a policy of promotion was inaugurated both in the consular and diplomatic services. Men of proved qualifications were advanced to important posts. It was also noticeable both that the commercial information obtained by our consuls abroad became more practical in character, and that there was greater celerity in giving it to the public. After Mr. Roosevelt became President there was also increasing evidence both that first appointments were being given to applicants whose credentials indicated ability rather than influence, and that the morale of the whole service was being toned up and improved.

It might be assumed that, as reforms have already been effected by executive order and otherwise, statutory enactment is not necessary. But until these principles are embodied in law they cannot be safe from possible future harm under some reactionary President. Furthermore, for other necessary improvements in the direction of systemization, legislative authority is of course absolutely essential. Year by year, therefore, we have seen vain attempts to get Congress to accept consular reform; in the

words of a leading journal, it has beco "a monotonous demand." This ye however, it is not so monotonous usual, for Congress seems nearer the ever before to providing for an improve service—this because Congressmen: pear to have more general and genuinterest in the subject, and also becauthe influences of the infamous old sposystem are not so evident.

The salient features of the prese measure, now before the Senate Co mittee on Foreign Relations, are: (1) classification within one year of all co sular offices in fixed grades; the prese members of the force to be assign to these; consular salaries also to classified on a more adequate basis; (original appointments to be made examination; no one to be examinwho is under twenty-one or over for years old (the age-limit of previous bil forty-five and fifty-five years, might ha been preferable); among the subject for examination one other modern la guage than English to be included; (original appointments to be made on to the lower grades; a freedom to 1 provided for in the transference of me from one place to another in the san grade; to countries in which the cons exercises judicial functions, no one be sent until he shall have passed a examination in law; (4) places in the higher grades to be filled by promotion from the lower; (5) a consular inspetion service to be provided—somewhat like that of the bank examiners to ou National banks; (6) clerks to consulate who command a salary exceeding a thou sand dollars a year to be American cit zens; (7) consular officers not to engag in business on their own account; (8 fees received to be accounted for an paid into the Treasury.

Some such measure is more nearly in line with what Congress would grant, we believe, than has been any previous bill. Hence, constituents at home, whethe citizens or corporations, who favor consular reform should write to their Senators and Representatives. Every citizen or commercial body in the United States is interested in the improvement of our consular service. The measure now before the Senate Committee would

benefit both the Government and our consular officers. The Government would no longer be harassed by complex and unsystematic service; it would be delivered from much of the influence of the spoils system; and would provide in the service itself such a consular trainingschool that succeeding Congresses would, by additional legislation, seek to emphasize the policy simply as a matter of trade advancement. To our consular officers and to possible applicants the effect of such a law would be equally beneficial. Those in the service who have proved their efficiency would receive recognition and secure retention, while young men, meditating upon their coming work in life, would be warranted in finally including the consular service among the careers that are self-respecting, paying, and permanent.

The Harvest of a Quiet Life'

There comes from the press now and again a volume of letters or memoirs which make us aware that the quiet life is not only strenuously preached but happily lived in our noisy age. There are still places where old-fashioned flowers bloom and old-fashioned people read the old books and practice the old virtues and keep intact the tradition of the old manners. There are, indeed, a surprising number of such people, if they could be counted by the census-takers; but a cardinal principle of their faith and practice is to keep out of sight. are many modest men and women who cannot enjoy this luxury because their occupations have more or less publicity; but the scholar's work, as a rule, escapes the eye of the reporter and goes unrecorded by the newspaper.

Such a life was led in the delightful village of Clinton, in one of the most beautiful pastoral sections of New York, by Professor Edward North, who died two years ago, after a service of more than half a century. "Old Greek," as the Hamilton students affectionately called

him, was not a man of profound erudition, but he was a true Humanist, which is far better. A simple teacher in a small community, he lived in and with his authors, and taught not only the form but the soul of a language. A great Grecian once said, in response to a disparaging remark about Mr. Gladstone's scholarship, that he lived with Homer. Professor North not only knew his authors, but lived with them. His relations with classic writers were so close that he unconsciously expressed in his teaching the. kind of liking or repulsion which most of us feel only for the living. He spoke of Æschines as if he were a neighbor of an unlovely kind, and his regard for Herodotus was tempered by his feeling that the father of history was a good deal of a gossip! Scholarship never became to him an impersonal pursuit, nor the books he taught mere material for linguistic and grammatical instruction. He penetrated to that immortal substance in books which has power to keep a dead language alive. This has been the distinguishing mark of the true Humanists from the days of Manuel Chrysoloras to those of Dr. Jowett; they owe much to the pedants, but are as distinctly of another race as are the poets who give words wings from the philologists who dig up their roots. His attitude towards his profession, which was both vocation and avocation to him, is suggested by this quotation from the " Memorabilia" written on the title-page of his "Index Rerum:"

The treasures of the wise men of long ago, which they recorded in books and left behind, I unroll and peruse in company with my friends; and if we see anything good, we choose it out, and we esteem it a great gain if we prove helpful to one another.

Professor North was happy in the circumstances of his life. He lived in a beautiful town, in the atmosphere of a small college which has always had a generous element of culture in its training and the service of able teachers; his home overflowed with books; and he opened his windows on an ample garden! It fills one with envy to think of his leisure, his reading, and his flowers. So full was the stream of his life that it continually overflowed the limits

^{1&}quot; Old Greek." An Old-Time Professor in an Old-Fashioned College. By S. N. D. North. McClure, Phillips & Co., New York.

of his occupation in all manner of records in prose and verse, memoranda of his studies, comments and criticisms; he had time to fill scrap-books and to keep journals; to make a report of himself to himself, and so to retain an objective impression of his own growth. The men who have the chance of working in many fields are far more numerous than those who have the chance of reaping where they have sown. Professor North was one of the fortunate few . who can both wander and wait; who can roam afield and come home at nightfall or at summer's end with the ripened grain. He slowly and quietly mellowed on the sunny side of the wall.

If he had been less content with his conditions, he would have been more widely known; for he had not only the habit of industry, but the gift of writing. He never mistook knowledge for original material; he enriched himself with it. He had humor, wit, sentiment, keen observation, aptitude for sound criticism, and the knack of saying things happily. His addresses on those occasions which appeal to men of generous ideals and sentiment were felicitous because they were so full of his own personality. simplicity, sincerity, and kindliness, combined with his scholarship, ability, and vigor of character, commanded the respect of his students and gave his relations with them a geniality and ease which were no small element in the college education. As President of the Alpha Delta Phi Fraternity, one of the most important of the Greek letter societies, which was organized at Hamilton College in 1832, Professor North was widely known and as widely honored by a host of college men in all parts of the country. Like all men of imagination, he had a great deal of the boy in him, and was on easy terms with youth to the day of his death.

It is wholesome to read the record of such a life as Professor North's at a time when so many careers are wrecked at the summit of the years by false valuations of the things of life; his clear integrity, intelligent aims, liberal tastes, and quiet harvest of peace and honor stand in striking contrast with the stained names, the discredited wealth, the unfaith-

fulness to trusts, of men who have had great opportunities of setting fidelity and purity of character before young men and have tragically failed to see and to practice virtues which give life its sweetness and society its moral dignity. These men have made life meaner; Professor North made it richer and finer. It might be said of him, as was said of one of his contemporaries in England, "he was a widener." And he might have made his own the words used by this contemporary English scholar of those Humanities which are the soul of scholarship and literature: "Suffer no chasm to interrupt this glorious tradition . . . Continuous life . . . that is what we want—to feel the pulses of hearts that are now dead."

The Ethics of Money

Adam Smith, father of modern political economy, said: "A guinea may be considered as a bill for a certain quantity of necessaries or conveniences upon all the tradesmen of the neighborhood." In other words, a sum of money, large or small, is an order payable to the bearer for a proportionate amount of service. Men wish to have these orders presented to them, that they may make a living by filling them. This conception of money is the fundamental requisite for its ethical treatment. It was remarked by Mr. Gladstone that a man's mental and moral character is largely revealed in the way he deals with money.

Most people think of money simply as a means for getting themselves served with whatever they desire. Everybody knows that he cannot, except by robbery, get the coveted money-order for service without some giving of service, more or less, real or fictitious. But to care more for getting the money than for giving its full equivalent in service is to have started on the down grade to robbery in a predatory state of mind. That money when not the gift of affection is held by no moral right, except as earned by a proportionate amount of service, is an elementary moral truth. In defiance of it an enormous amount of predatory wealth has been accumulated in recent years. A financial "operator" has testified in a Boston court that he and his partners "made" \$46,000,000 by promoting a certain trust. Fancy, if possible, the vast total of services by all sorts of men to which that staggering sum gave legal claim! From such enormities public indignation, class hatred, and social danger spring. Lowell remarked that there is dynamite enough in the New Testament to shatter our social system, if not carefully handled. Jesus' saying, "The Son of man came not to be served but to serve," is true of every son of man. "He that is great among you shall be your servant" is a fundamental law of the Republic of God. Essential to social stability as well as to personal integrity is an ethical valuation of money as the measure of service in equal reciprocity between man and man.

This requires the service rendered to be balanced by a sum of money good for an equivalent amount of service, and no more. The rule is incontestable. The courts continually apply it in scaling down excessive claims for service rendered. In applying it, or any other rule, we expect to meet problems. So all agree in the general principle of justice, "To every one his own," but in a given case we divide upon its practical application. Here, then, we encounter the crucial question. What is the true criterion of the money value required to measure the just exchange of equivalent services? The service rendered has saved life or limb. Shall its just compensation be measured by the value of life or limb? It has saved an estate, it has vindicated a good name, by bringing the spoiler or the slanderer to justice. Is the benefit value of such service to its receiver the true criterion of the compensation due? To affirm this is simply to charter extortion limited only by the resources of its victims, like the recent reported charge by a New York surgeon of seven thousand dollars for operating on a common case of appendicitis. The claim to profit proportionately to the peril or distress which service may relieve is an inhuman claim, commending itself only to coiners of cash out of human woe, like the cartmen who demanded a dollar a minute for salvage service while Baltimore was burning. The only criterion compatible with the social spirit of unsophisticated humanity is the cost value of the service to its giver.

In so saying it is not forgotten that service-givers differ in efficiency. One will spend two days in doing what another will do in one. The cost of inefficiency is not to be added to the cost of service. The trade-union rule of restricting the output of service to the capacity of the backward is morally indefensible. . But one cannot here discuss particular applications of the general principle which none who accepts the authority of the Supreme Moral Teacher of the world can consistently deny. As in the case of his Golden Rule, loyalty to the principle must be trusted for its practical working out. Here, however, one caution is to be borne in mind: the cost value of service must be as comprehensively reckoned for the weaker as for the stronger givers of service. That it is not vet so an unimpeachable economic authority has observed. Says Carroll D. Wright: "Capital charges to the consumer the depreciation of property and machinery. Why should not the depreciation of human machinery, its hands, its brain, its body, be included in the final cost?" The list is suggestively incomplete. Should not the laborer's cost of service include also provision for a sanitary home, and for the exemption of his children from being taken out of school to earn their bread? How inordinately in contrast with the scrimping of the weaker part of the community the cost of service has been figured for the profit of the stronger has recently been glaringly revealed upon the witness-stand. It even poses as "reform" when the president of a company organized for the benefit of widows and orphans accepts a salary "reduced" to a sum eight times larger than the salary of the Governor of the Bank of England.

But men greatly vary in ability, and ability enhances the value of service to the receiver. Does it not deserve proportionate return to the giver? In a moral estimate this depends on what it has cost the giver. So far as his ability is the product of laborious and expensive preparation and culture, it has cost him something, and has justly earned a

proportionate return. But so far as it is a gift of nature, it has cost him nothing. Then it can hardly be thought to have earned a money claim to service, unless natural inequalities were designed to create or perpetuate artificial inequal-Despotism derives its claim to service from having been born in the Democracy cannot. It seems morally preposterous to think of divine endowments as given for private emolument, or for any other purpose than social benefit, and so enabling their possessor to gain social rewards which make his fellows no poorer to give. The greater the service, the greater the due reward. But the highest rewards, except by the sordid, are not counted in cash. Social esteem and honor outshine and outlast all other wealth. In a more humanized period than ours, when man's wit, if not, as once, his weapons, is sharpened against his neighbors, these will be the only recognized prize for competition. Already is this presaged by the physician discovering some new preservative of life, who prefers the honor of giving it to the world to the profit of a royalty upon its use.

All reputable economists agree that the present problem of their science is a more equitable distribution of wealth. In plainer words, our economic system is such that a few secure orders in the form of money for much more service than they have given, while many can only secure considerably less. The root of this injustice is an immoral estimate of money as merely a means for commanding service, rather than as the measure for a just exchange of service. The capitalist scores the workman for caring more for the quantity of wage than for the quality of the work he gives for it. But he himself cares more for his dividends than for the service alleged to earn them. Both are tarred with the same stick. The difference in the practical result of their immoral idea of money is the difference between grand and petit larceny.

Here, then, is fallow ground for moral and religious teachers to break up, and sow with some elementary truths of Christian ethics. Not more do the arid lands of the far West need irrigation than the torpid moral sense of a moneyhunting community needs to be sensitized to a moral estimate and use of money as the measure of services given and received in just exchange. Society is based on this just exchange in equal reciprocity. He who attempts, by the acquisition of money, to command more service from his fellows than he renders them, is unconsciously working for the disruption of the social bond and the ruin of the commonwealth.

The Spectator

"Timeliness," the Spectator observes, consists in doing things four or five months beforehand. Last year he fully meant to make him a garden; but when, the frost being out of the ground, he set about looking up seeds, and gardening books, and a tiller of the soil, he found the questions involved so abstruse that before he had settled a tithe of them harvest was upon him. This year he proposes to get well in advance of the season. So, while Mrs. Spectator fretted her soul over Christmas, he plotted garden, basking in the anticipated sunshine of spring. "Would Charlie like a scarfpin?" queries she. "Doubtless," says the helpful Spectator; "he's collecting. But, see here, this is vital. 'The proper exposure for asparagus beds-'" But Mrs. Spectator escapes.

8

Let none assume that the Spectator's soul grovels altogether among the edibles. His real enthusiasm is his wild garden. He was not always in love with wild gardens, the commonality of them being, he opines, either not gardens or not wild. He recalls one neat animated herbarium, stuck full of tin labels, marching mathematically by twos and fours, with here and there a nostalgic blossom pining on its stalk—a scientific outrage calculated to make a sentimentalist mourn. Another so-called wild garden confronts the Spectator with artfully disposed masses of things once wild, which, under the hand of the landscape artist, have assumed a sophisticated waywardness quite uncanny. The Spectator covets

no calculated jungle. To him it seems neither natural nor honest.

His wild garden will be like unto neither of these. He will buy him a bit of real wilderness within trolleying distance of his suburban home, and there, among the wild things already on the land, he will persuade the boldest as well as the shyest of forest blooms to grow. Then, when the "old spring fret" attacks him, he will journey, not to Farmer Jenkins's wood lot (which that unsentimental worthy may have converted into fagots since last spring), but to his own forest preserve, where neither barbed wire, nor bulldogs, nor berce-eyed cattle menace him, and where in loyal companies stand waiting the delicate firstlings of the year.

If ever the Spectator breaks the shaltnot-covet commandment, it will be on? account of a certain wild garden up in the provinces. It was June when he alighted at "Ingleside," on the St. John River, such a little station that the train would never have hesitated at it save by request. Inquiring warblers greeted him from the copses, "Which-is-it? Which-is-it? Whichity — whichity whichity-which ?" Minding instructions, he plunged down a road deeply shadowed by evergreens, and came shortly to a rustic gate. Set in a bed of sweet white violets, it gave upon nothing more habitable than leafy woods. The Spectator pushed in and stood dubitating in a green allee of giant ferns. when the owner of the jungle discovered him, and hauled him, somewhat broken in wind, up to a picturesque eyrie full forty feet above the road. While he rested his eyes on curving reaches of dim blue river and caught his breath, his host explained his garden.

"When I was seventeen years younger," he began, "I had an audacious dream. I would make this snug twoacre plot of mine a vegetable microcosm of the Province of New Brunswick. Every tree, shrub, flowering thing, grass, moss, and lichen in the land should flourish here within eye-shot of my window. Well, I've failed; but I've no apologies for the result. I can take you down to that pocket grove and show you good specimens of all but four or five of our native trees, and most of our shrubs. All the ferns are here, and I have, or have had (for I keep no official necrology), some five hundred flowering plants. As for lichens and grasses, I'm afraid they camp at their own pleasure. But it's been a good seventeen years' work. I'm satisfied."

(2)

The Spectator ran his eye over grove and meadow and barren knoll. "Trees I see and ferns I see," he said, "but where are your wild flowers?" The gardener smiled. "If you could see them, my garden would be like all the rest. But I've no beds, no rows, no classification. They're all over the place. My model sower is the wind. Of course moisture-loving things must go in the damp hollow in the grove, and heaths do best on that dry knoll. But if you want my wild flowers, you must search precisely as you would in the woods." So saying, he led the Spectator on a tour of discovery. Being no botanist, the Spectator let scientific names glance harmless off his brain. But he knows that a weedy meadow yielded up an amazing variety of plants, all such as love the fierceness of a summer sun, and all looking as settled as if they were not shanghaied colonists. On the knoll, presided over by one ancient white pine, arbutus and Scotch heather got on famously together, the latter living under the gardener's displeasure as an unnaturalized alien. Flowers were not overplentiful in the lush tangle of the grove, it being already late; and the Spectator is no connoisseur in leafage. But every boulder waved with luxuriant rock-fern. "You'd scarcely guess that those ferns, and in some cases the boulders too, were imported?" queried the botanist. The Spectator certainly wouldn't. But it appeared that his host was accustomed to pillage boulders in woods where only nibbling sheep would feel the loss, stripping off the close fernmat, roots, soil, and all, and, rolling it tenderly, convey it home in a wheelbarrow, there to be applied to his own

barren rocks. 'They'll stand almost anything," said he, "except being sat upon. I had a gentleman here one day and I left him for a moment, and when I found him he was draped luxuriously over my finest fern-boulder, smoking. 'I'm afraid you're not comfortable,' said I, in an agony. 'Immensely cozy, old fellow,' he responded, wriggling about to show me how nice it was, and sending into eternity a dozen ferns at each twist. He never came to Ingleside again!"

"So you have your enemies?" queried the Spectator. "Enemies?" he said, with uplifted hands. "I'm never safe. I'm too unhandy for the wild-flower pillagers. But telegraph gangs pursue my trees; and Polacks at work on the railway culverts throw rocks on my orchids, and visiting botanists grub up my choicest specimens for their herbariums. And then there's the brook! When I took over this place, I fancied all it needed was my guiding hand to make it spread out into lily-pools and quiet reaches where I could harbor waterplants. But that's a deceiving little brook. In spring it swells to a raging torrent, bursts all my bounds, and absconds with my aquatics to the riverside, where they not infrequently settle down and thrive. When I want them again, I go out and lead the wanderers home."

"Why not a concrete dam?" suggested the Spectator. "Too costly. One shining merit of this garden is its cheapness. My plants I kidnap; my saplings likewise. No hand but mine is employed about the place, and the only fertilizer needed is loam from neighboring woods. Come and see how I work." So saying, he possessed himself of a trowel, and led the Spectator down the road, and presently into the damps of a near-by thicket. "I noticed a Cypripedium here," he said, "that might better be blooming in my woods. Keep a lookout for what Gray calls 'pink-purple.'" But it was not the Spectator who gave the view halloo. "Now," said the gardener, as he delved at the root of the spectacular thing, "note the situation of this orchid—wet ground in the shade of evergreens. We'll find it a nook just like this. And just pull up a square foot or so of that leafy moss. I've some Goodyera plants that came out of moss like that, and it'll make them feel at home." Grubby-handed but hugely interested, the Spectator followed to the grove, and had the pleasure of seeing the lady-slipper accommodated with a congenial berth, and of beholding his own initials inscribed on the label driven down beside it. "Henceforth," said his host, grandiloquently, "that orchid blooms in honor of you!"

"You do use labels?" inquired the Spectator. "Oh, yes, or else I'd always be planting things on top of each other. They serve as tombstones for things that die of our chill fogs, and as moderators of my vanity, too. See here." (He drew from under a bench a great box full of labels.) "In the first flush of confidence I made labels for the whole flora of the province. These are my defeats. Howeyer," he went on, "the rewards have been a thousandfold. My hobby has carried me to the wildest parts of the province plant-hunting; it has been responsible for canoe trips up the Restigouche, the Nipisquit, and the South Tobique Lakes. Scientifically, of course, the place is of considerable interest. especially in the opportunity to study plant affinities and aversions. Plants pitch upon a newcomer like chickens in a coop, and if I didn't cut them back the old inhabitants would choke my new importations in short order. Then, a secluded, woodsy place like this becomes a favorite stamping-ground for birds and small beasts. Best of all, there's the perennial uncertainty of the thing. Specimens I have carried hundreds of miles sometimes flourish when those transplanted from the next farm pine away. Every spring is a fresh surprise. I have all the excitement of gambling without the vice."

Now you know why the Spectator spends his evening printing neat botanical labels, while Mrs. Spectator jeeringly refers to chickens counted before they are hatched.

THE CAUSE AND PREVENTION OF RAILWAY ACCIDENTS

BY CHARLES DELANO HINE

Author of "Letters from an Old Railway Official to His Son"

The writer of this article is a graduate of West Point and of a law school, who, after honorable service as an officer of the army, resigned his life commission to become a freight brakeman. Major Hine, now engaged as an operating expert in the examination of various railways and as an editorial writer for "The Railway Age," has worked in the last ten years as brakeman, switchman, yardmaster, conductor, chief clerk, trainmaster, assistant superintendent, and as general superintendent, besides finding time to serve as an officer of volunteers in the Santiago campaign of the Spanish-American War. Our readers may be assured of his thorough practical knowledge of the important subject he discusses.—The Editors.

NO the layman the question of railway accidents seems simple; to the railroad man it is complex. An aroused public sentiment demands that greater safeguards shall be thrown around the traveler and the employee. Public opinion is king, and in obedience to its royal mandate we railroad men are trying to solve the problem. It is not as easy as it looks. Block signals are accomplishing a great deal, perhaps more than any other one factor. The railway practitioner, like his medical brother, never finds any one specific for all germs. The causes for accidents are often organic, sometimes sporadic, and usually typical.

It is a high tribute to the railway profession that so great is the popular faith in our ability to overcome obstacles that we are expected to meet the situation promptly. The municipal reformer is borne with if a new set of rascals develops in the triumphant reform party. The sanitary expert who cleans up a fever-ridden city is not held responsible if his successors become lax and an epidemic breaks out. Railroad men, however, like generals in the field, must show results quickly or the popular demand for redress assumes a drastic form.

It is only three-quarters of a century since George Stephenson constructed the first successful locomotive, and it was driven by a man still living. In the brief span of two generations has resulted the vast railway system of America, with more than 200,000 miles of line. Trans-

portation harks back nearly to the beginning of human life, but its primitive forms contain less in common with modern conditions than do manufacturing, navigation, law, medicine, banking, and insurance. Without the wisdom of the ages to guide us, we of the railroads have had to make precedents and pay dearly for the experience. On the whole and in the large, we have little to be ashamed of, but our just pride must not beget criminal indifference or preclude progressive policies.

The most elaborate devices for the safe operation of railways are as naught if the men who use them are not properly trained and handled. The morale of the service is the point on which railway managers fix their attention. All try to build up an esprit de corps, but few really succeed. Ignorance of fundamental principles of organization is too common. This will not be remedied until officials of railways are trained along fundamental and comprehensive Just as the intended builder of fortifications must himself handle a pick and shovel at West Point, so should the future maintainer of way work on the track. Just as the coming admiral must go aloft on the school-ship from Annapolis, so should the would-be superintendent learn the hurricane deck of a freight train. Few railway officials can actually drive a track spike, fire an engine, or brake a train. If an official has happened to learn one practical branch, the chances are that he has not acquired

Digitized by Google

another. The all-around training of the cadet is necessary for the development of the great captain, and great captains are necessary to large organizations. When we have better-trained railway officials, we shall have more comprehensive policies and a better morale among our men. In the meantime there are many things that can and will be done to bring about safer service.

Railroads represent enormous investments of capital in the aggregate, but distributed among many people. Capital from its nature is conservative, and a conscientious desire to protect the stockholders, many of them humble citizens, sometimes results in unwise parsimony in railway presidents and directors. Chances of disaster are taken rather than spend money in safety appliances. This ultra conservatism is seized upon unjustly by the sensational press as an indication of criminal corporate greed. As a matter of fact, in the operation of most large railways, good money is wasted through violation of basic principles of organization and administration sufficient in amount to equip in a few years every mile with the most approved block signals and other safety appliances. Enough money is disbursed, but too much of it is spent in folly rather than in wisdom. This will not be corrected in a day or a year. It will take perhaps a generation to overcome the lack of prevision in the past, and to shake off the fetters we have forged by unwise specialization. A comforting and encouraging feature is that there is comparatively little graft. Where there is honesty of purpose progress is easier. So rapid has been the development of railway transportation that we have been early in reaching the inevitable stage of Bourbonism. What form the equally certain revolution will take depends largely upon ourselves. Would we avoid the cumbersome, expensive, and generally undesirable method of governmental regulation, we must cultivate an attitude of solicitude for human life, apart from its punitive value in dollars and cents.

A fruitful source of accident is in the heavy equipment of the present day. Locomotives have been built of a size and weight utterly unwarranted by the

development of track and roadbed. A school of get-rich-quick railroad men has come out of the West and hypnotized most of the profession into believing that true economy in operating requires a maximum train-load. They reason that, as the same number of men can handle a long, heavy freight train as a short, light one, much money in wages can be saved by running fewer trains; that every additional car per train is hauled for practically no cost. The idea of something for nothing is always attractive to Wall Street, and now one of the tests of efficiency in operation imposed by the financial world is the average train-load. In the past trains were admittedly too light; at present they are undoubtedly too heavy. We must vibrate back to a happy and economical medium. statistician yet knows the true cost of the attempts we have made to strengthen roadway and bridges, and to enlarge facilities to handle the big train. This heavy train-load has been the greatest element of demoralization in the rank and file of the railway service. To its ramifications may be traced more accidents than to all other causes combined. In order that an artificial paper record may be built up for the management, men are started with a train so unwieldy that they are discouraged from the start. They are paid overtime for extra hours worked, but overtime does not keep them awake and vigilant when dragging over the road an excessive number of hours at a stretch. A train of seventy-five cars is over half a mile in length. The time consumed by the conductor in going to and fro between the engine and caboose has a bearing upon practical train operation which is not appreciated by the man behind the desk in New York. railroads have trained their men to regard the mile as a sacred unit of compensation in making wage agreements. With innocent inconsistency, they turn around and go before rate-making bodies with the just and proper claim that distance is not an all-determining factor; that a short haul may, under certain conditions of traffic and territory, be entitled to a higher rate than a long haul.

There are approximately a million and a half railway employees in the United

For this vast host there are only about five thousand general and five thousand subordinate officials, making a total of about ten thousand officials, or an average of about one for every one hundred and fifty employees. We are inadequately officered, and authority has to be delegated to foremen and clerks to a demoralizing extent. The result is a laxity in discipline, due to insufficient supervision, which is reflected in unnecessary accidents. The bent of the railroad mind is such that if an additional official position is created, the new official soon asks for a stenographer and builds up a bureau of records and correspondence around himself. Efforts are being made to correct this evil and concentrate clerical work in fewer offices. Railway officials all favor this in the abstract, but not one in fifty knows how to organize his territory properly. Railroads have much in common with military organization. They can learn from the accumulated experience of centuries of army existence. Thus, a regiment of twelve hundred men has from forty to fifty officers, or one for every twenty-four to thirty men. Each of the twelve companies keeps a record of its men, and all regimental records are concentrated at headquarters. In spite of this simplicity of administration in field units, the staff departments built up a bureaucratic system, which broke down in Cuba and in South Africa. The remedy in this country has been a general staff for the army and a general board for the navy. Every large railway system needs a general staff, divested of administrative responsibilities, but advisory and supplementary in nature. Railroads are burdened by bureaus and departments not properly balanced, which give a chief clerk in an office more authority than a higher-paid official of rank on the ground. dents will not be materially decreased until such organic evils are eradicated.

The tendency of railway executive and general officers is toward Napoleonic methods. Too frequently there is lacking as a necessary accompaniment both the genius of Napoleon and the indispensable training of his youth as cadet and under officer. The railway profession is too young to have many whole-

some checks on abuse of authority. general in the field cannot permanently degrade an officer or man without due process of law. A railway official usually holds his position at the pleasure of one or two superiors. Dwarfed he may easily become, and lacking in boldness and originality, under such a system. Skilled employees, in many cases driven to unionism by arbitrary abuse of power, have a firmer hold by virtue of the strength of their labor organizations. Reforms must begin at the top, and we must improve official tenure before we can comprehensively train our men to avoid accidents.

In the rapid growth of the country, captains of industry have floated away from old-time moorings set by directors and stockholders. Many of the industrial absolute monarchies thus resulting have had good czars, and results have outstripped those obtainable by any other method. Too many have become drunk with power, and the reckoning for their stockholders has been heavy. Recent events in banking and insurance have awakened directors to the fact that they must direct. When railway directors appreciate more fully their responsibilities, there will be fewer accidents. power should not be exercised directly. any more than a committee of Congress should attempt to handle a fleet at sea. The president and his staff must act through a one-man system, but that oneman system must be held to a strict accountability to the interests it represents, to the source that appropriates the money it expends, to the public whose lives are intrusted to its keeping.

The railroads alone are not responsible for conditions that result in accidents. There is a responsibility upon the citizen. In general, a civic community may be said to have as good a government as it deserves. The same may be said of its railway service. As long as public sentiment countenances the holding up of corporations at the muzzle of a threatened legislative act or municipal ordinance introduced for unworthy motives, the probability of accidents cannot be greatly diminished. As long as people consider it legitimate and smart to beat a railroad company, or to secure a pass

on the flimsest pretext, just so long will money be wasted which should go to improve the service. When more juries regard their oaths and give corporations fairer verdicts, then will travel become safer.

As practical people, we are not sitting idly by and waiting for improved corporate, sociological, and ethical conditions to safeguard the traveler and the employee. Much is being done. way, bridges, track, and equipment are being rebuilt and replaced at an enormous outlay. Thousands of miles of block signals have been installed at a cost of from one to three thousand dollars per mile. A block signal is merely an indicator of the occupancy or non-occupancy of a stretch of track called a "block." A signal is useless unless its command is obeyed. Too often a lax discipline winks at disregard of signals in order to make fast time. Then, when trouble comes, an unconscious administrative cowardice lays all the blame upon the poor fellow directly at fault. Where the block signal is interlocked with a derail, as at a drawbridge or the crossing of another railroad, the train disregarding the signal is stopped by being run off the rails on the ground. This is a drastic and violent precaution which sometimes results in greater loss of life than if the collision itself had occurred. Devices have been invented which automatically stop a train the instant it passes a block signal set at danger. steam roads these appliances are generally regarded as still in the experimental stage.

The collision is the least excusable form of accident. The causes for collisions are numerous, but nearly all go back to questions of organization and discipline. One excuse given by managing officers for loose discipline is the tyranny of labor organizations. It is claimed that the only way to enforce discipline is to discharge men, and that if men have to be reinstated at the behest of grievance committees, all proper effect is lost. While this contention is in part true, it betrays a deplorable lack of appreciation of the true mission of those invested with authority. Many unwise labor contracts have been made by railroads. Too often principle has been temporized with to avoid the expense and inconvenience of a strike. Officials who are trustees for large properties sometimes yield too easily to demands which ultimately restrict employees to certain classes of work and hamper the development of the individual. This results in men being laid off at certain seasons without work, while a comprehensive scheme of organization would allow the man to be transferred to another kind of work. It is not enough to say that the men bring these conditions on themselves. They should justly but firmly be prevented from so doing. fruitful source of accidents is a defect in track. Can we expect the track-walker to be vigilant in scrutinizing every bolt and tie on his lonely beat, when any day it may be his turn to be replaced by another of his section-gang in order to reduce the pay-roll? In summer track forces are large. In winter there is less work for them, but more in the shops and engine-houses. There should be some degree of interchangeability here. Such problems must be solved before accidents are fewer.

Defects in equipment contribute their full share to the number of accidents. A loose wheel, a broken rod, a bent axle, a loose nut, may send a train into the ditch and its human freight into eternity. The inspector whose duty it is to discover these defects in time must be a man in love with his work, who feels himself during good behavior enlisted in the army of his road. Until wise methods give him this feeling, until he is helped in bearing the brunt of economic and industrial changes, he will not do his full duty in preventing accidents. In the meantime firm but considerate discipline accomplishes much and can accomplish more.

Few people appreciate the true meaning of the word discipline, which can be found by going back to the same root as the word disciple—a learner, a pupil, a follower. With this fact should be kept in mind the immortal words attributed to George Stephenson, namely, that the highest branch of engineering is the engineering of men. Engineer the men properly and accidents will be minimized.

Railroad accidents there will always be. Mankind cannot harness the forces of nature, cannot dart through space, cannot minimize the effect of time and distance, without some risk of life and limb. There should, however, be less hazard in traveling on a well-organized railroad than that assumed by the farmer's son or daughter in riding the unbroken colt over the pasture-bars.

THE MOTORMAN

BY SYLVESTER BAXTER

O not talk to the motorman!" The open car was whizzing along the country roadside and I was on the front seat. The legend upon the roof-rim gave admonitory coun-But I was not talking to the motorsel. man. The motorman was talking to me. Perhaps on my part this was a passive violation of the company's rule. But I felt no call to discourage the talk. the first place, I did not want to seem rude. To assume a cold and distant bearing was contrary to my nature. Moreover, I was interested in what was The man was companionable, and he evidently had a desire for companionship at the moment. I noted that he was all the time keeping a vigilant look ahead. And, above all, he was entertaining me with some accounts of the motorman's life and of the sort of happenings that are peculiar to the street railway. His talk was broken by frequent intervals of silence, for every now and then we would thread a section of meandering track or cautiously descend a troublesome grade. At such moments I made no question. But when the track ran free and straight ahead, I would respond with a word or an assenting nod. Whenever we lay at turnouts for a coming car to pass, he would assume the vacant place beside me and rest from his constant standing. Then I would take more active part in the conversation and ask concerning this thing and that.

At one long stretch there was a complication of curves and of down grades. I sat regarding the figure before me. It was erect with the statuesque immobility that marks the motorman's calling. The distinctive dexterity of the trade was the simultaneous manipulation of

the controller-handle and the brake in opposite and outward directions. These adroit motions suggested the hand movements of a prestidigitateur before an audience. But now, with the gradual substitution of the pneumatic brake for hand power, this gracious token of the trolley is passing. A sense of greater safety is the compensation.

How quickly a new trade stamps its character upon the men who follow it! It differentiates them by divers subtile indications. It remolds their features with new contours, graves them with new lines. It organizes new vocabularies; words, perhaps familiar, fall from their lips with novel implications that make laymen feel ignorant-much the same helpless ignorance that one feels in the presence of a Sanskrit scholar when he discourses of his specialty. It abolishes old perils, but it develops new ones. The trolley allays all fear of scalding steam, but the "live wire" inspires us with a new terror. The new vocation also adds new sorts of maladies to the long list that human flesh is heir to. Has not somebody heard of a "motoritis"?

Little more than three lusters have passed since electric power began to supersede animal traction upon the tramways. In its dispersion over the world it is now universal. Trolley-line practice, like the steam railway and like the sea and its sailors, already has its own traditions and even its conservatisms and its trade-clannishness—perhaps its superstitions as well. How long will it be before it develops its adventurous and romantic aspects and calls in literature to work them up? There is already a deal of good raw material in waiting.

I once traveled in England in the company of an eminent man of science.

He was fond of tracing the course of evolution in everything that came under his eye, and he did it fascinatingly. the railway he showed how nearly every feature of the fittings in the compartment was a survival from the stage-coach. In a restaurant he traced the development of the electric-light fixtures from gas fixtures. In like manner, while the steam railway's equipment is derived from the stage-coach, so the street-car, the tram-car, blends the city omnibus with the passenger-car of the former. When the trolley came in, it was a question whether the term "driver" should be retained, as on the steam railway in Great Britain. It was even seriously proposed to adopt the verbal monstrosity "motoreer," in analogy with the locomotive engineer. But, fortunately, the sensible word "motorman" found universal acceptance.

Just as not a few old stage-drivers became train conductors, and even locomotive engineers, so many old car-drivers became motormen. But about the motorman of to-day there is no suggestion of horse or stable. Mechanical environment has driven those associations clean away, as they have from the locomotive engineer and fireman. As a rule, the motorman knows no more than does the average passenger about the laws and the mysteries of the subtile energy whose power obeys his hand. But he knows a deal about its peculiar actions and behavior, and he is skilled in dealing therewith so far as he is called to be.

Not every man is fitted for a motor-Many of the best old horse-car drivers failed when they exchanged the reins for the controller-handle. nerves, presence of mind, instantaneous response to emergency demands, are required to a degree not excelled even on the steam locomotive. The strain on the nerves is something tremendous. Hence the motorman is peculiarly subject to nervous disorders and their attendant maladies. These strong, alert fellows often wear out in a very few years under the exceeding stress of their work. The life of the railway engineer is placid in comparison. At any moment some emergency may make a demand upon the nerves comparable to that upon the motor itself when the full current is suddenly turned on or as suddenly shut off. In the case of the motor, when the force of the current is too great for the rheostat to take it up, the fuse burns out. There is a flash, a report, the startled passengers jump, the women scream, the car stops. But no particular harm has been done. The burned-out fuse has saved the motor. The excessive current, melting the metal, has cut its own connection and can go no farther. The motorman gets down to the trucks, inserts another "safety-plug," and the car goes its way.

Possibly the human organism may have the equivalent of a rheostat. But no fusing contrivance has yet been adapted to the needs of the nervous system. So, at moments of nervous strain, when the vital energy is disturbed in its course by some instantaneous interruption, it goes worse with the motorman than with his motor. The man is fortunate if some nerve has not been burned out because of a tension far beyond the point of safety.

The locomotive engineer has his clear track, the right-of-way is fenced in, frequented grade-crossings are guarded. His daily routine is seldom liable to break. But where the trolley-car speeds along the common highway, something is likely to happen at any moment. In the motorman the vigilance of the locomotive engineer is immensely intensified. At any moment his hands may have to make response to alert eyes. A bewildered person gets in the way; a child, impishly daring, scampers across the track; a team suddenly veers across the road. Prompt slowing down, sudden stops, may be called for numerous times in the course of a trip. These things, constantly recurring, subject the motorman to a physical wear and tear more serious than that put upon the carwheels. The latter often get flat intervals worn in their originally perfect circles when the sudden brake clutches them and makes them slide along the The "flat wheel" hammers the track with each revolution and makes rough going. But it is taken to the repair-shop and turned true again. is not so easy to repair the motorman's strained nerves. Every day, several times a day, some excessive draft upon them is likely to make his heart jump into his throat and his breath stop short. When peril is averted by a hair's breadth, it leaves him white and trembling. keeps his way and runs his trips-but what exhaustion at the end of the day's At times he breaks down and cries like a child. Again, something more serious happens, something like a nightmare in its sense of fright, of terror. It is seldom his fault. But he feels his responsibility; he was the instrument. Then he faints away, he is completely unstrung and is deathly sick. It is no boy's play, the simple-seeming task of guiding a trolley-car.

Being a comparatively new calling, few motormen are primarily trained for the work. Though far from "unskilled labor," the pursuit is something fairly easy to learn, though requiring some special aptitude. The ranks are recruited from those of many and diverse occupa-Among these are some that are the last which one would expect to find represented. One late autumn day I was on the way into town; the air was mild and the crowded box car was unbearably close. I escaped to the front vestibule for air; fortunately, the motorman had the plate-glass window open before him. As we crossed the river I looked down stream to the shipping at a great coal-dock and remarked: "There's a big six-masted schooner down there."

"Yes, and four five-masters besides," said the motorman.

"How few square-riggers we see in port nowadays!" I observed.

"Mighty few," he replied. "Squareriggers are getting scarce. But there are three of them further down; one of them is a pretty big craft—a four-masted ship."

I looked closer at the man beside me. Something in his way of speaking and in his bearing told unmistakably of the salt water. "You seem to know something about vessels," I remarked.

"I ought to by this time," he answered.
"I was more than thirty years at sea—
twenty of them in command of squareriggers, sailing to all parts of the world.
My last ship had her keel pounded out
of her on Nantucket shoals; we lost our

bearings in thick weather. I owned a good part of the vessel; there was little insurance, and everything I had was invested in her. After that I concluded to keep on shore. I had had enough of the sea. That is why I am here to-day at the bow of a trolley-car instead of on a ship's quarter-deck."

I afterwards learned that there were three old sea-captains running as motormen on that one division of a great street railway system. It is related that at one time the police force of old Salem was largely made up of veteran sea-captains, left stranded by the decline of American shipping. But here was a new calling that seemed to have a special attraction for seafaring men, perhaps because substituting a mild sort of land navigation, as it were, for their wonted wanderings over the world. I once knew an old shipmaster who, on retiring from the sea, invested his savings in a canal-boat, passing the rest of his days in navigating the placid Erie. Thenceforth his course was upon still water, and he retained the importance of command and the privilege of free expletive. But the life recalled salt water, much as ginger ale might be reminiscent of champagne. As a pursuit, the piloting of a trolley-car is far more adventurous.

Many a motorman has his avocation. I knew one who, besides giving much of his spare time to pigeon-breeding, derived a considerable income as the landlord of a couple of two-flat suburban houses. Another one told me about the wellordered farm that he owned in Maine: he had left it in charge of a competent relative, and it yielded good returns; he spent a vacation there every fall, and some time he meant to go back there to pass the rest of his days. But he liked city life, his motorman's wages were so much net income, and he had the farm to fall back on. So he felt himself pretty well fixed.

In modern fiction, as a field for tales of adventure, the steam railway has become conspicuous in recent years, the locomotive engineer a special sort of a hero. Runaway locomotives, derailments, collisions head-on and rear-end, exciting episodes on the plains and among the Rockies, pioneering, the rude

and often perilous life at the front while a line steadily advanced its track into the continental wilderness—all this diversified life of the railway, with its complex organization, has offered rich material for popular writers—men like Spearman, Cy Warren, even Kipling—until railway stories, like those of the sea, have taken rank in a class by themselves.

The electric railway is so new that it has not entered into literature to any marked extent. Authors have not yet acquainted themselves with electric railway practice or mastered its interesting technique. Strange to say, they have passed the trolley-car by for the yet newer motor-vehicle. But its day will surely Perhaps the electrification of what is now the steam railway will hasten This consummation has long been expected, and apparently is now not far away. And when the controller-handle replaces the throttle, will not the locomotive engineer be a man of the past? Will not the motorman come to the front. with all the heroic potentialities that by good right are his?

As it is, the humble trolley-car has a history that, brief as it is, teems with adventurous material. And recent developments in interurban electric lines bring the field close to a mergence with that of the steam railway. Even now an ambitious and resourceful young author has but to haunt the car-barns to gather all manner of good virgin matter for his purposes.

In the larger aspects of adventure the trolley line offers worthy parallels with the steam railway. The romance of old highwayman days, for instance, is brought down to date by the train robbery. But in populous eastern Massachusetts a rural trolley-car was the victim of a midnight attack a few years ago. was all the traditional "stage business," as it were-masked men, revolvers ominously pointed, "hold up your hands," etc. Most of the passengers were homeward bound from the Boston theaters; everybody was thoroughly scared, and they all meekly gave up their wallets. After the thing was over, some of the All the women indulged in hysterics. passengers were cleaned out. were no nickels left to pay further fares

with, and the conductor, who had been the first one "cleaned out," felt justified in relaxing the company's rules and giving his passengers a free passage for the rest of the trip. The robbers could hardly have found their adventure so remunerative as it would have been "out West." There was no express safe to blow up and plunder, and a company of local trolley-farers could not have yielded the returns that would have come from a trainful of long-distance travelers. It was suggested at the time that the robbers were professionals from the plains venturing into a new field. that seems highly improbable. Doubtless they were youthful amateurs of the neighborhood, fired to their derring-do by over-indulgence in literature about the James brothers and their ilk.

In the same part of the world a trolleycar was snowed in one wild winter night. The rescuing snow-plow did not arrive till late the next morning. It found the passengers tired and hungry. But the current was on all through the night, and kept the car both light and warm.

As for railway horrors, what could surpass that Melrose disaster? A box of dynamite dropped from the team of a careless expressman; then, a few minutes later, in the still moonlight evening, an outward-bound trolley-car, well filled with people returning home from Boston, blown into fragments-many persons killed outright, others frightfully maimed. The horror of it was not for those whose lives were snuffed out. They never felt what happened. One of the passengers was a lady, who, being in the rear part of the car, escaped with a severe nervous She heard no explosion, was not in the least aware of the appalling disruption. One moment she was sitting quietly in the car; the next moment, as it seemed to her, although it was hours afterward, she awoke in her bed at home, and was puzzled as to how she came there.

To return to my motorman—the one who at the beginning was talking to me. Some of the things he told me suggested how closely akin was his calling to that of the locomotive engineer. His communication was largely autobiographic. He had been a carpenter by trade, and

he had something to say about his wife and children in their snug little home; he had built the house with his own hands. He had been on the line a couple of years. Everything had been going on so smoothly, so void of ill happening, that he had grown to feel it would always be so, that nothing out of the common ever would happen. It had been that way for eighteen months. Then three things happened one after the other—all in a row, as it were. It was not only on that very line, but right along in that very part of it where we were just then. He really could not help mistrusting that somehow the region was **hoodooed** for him; he now felt prepared for anything that might happen along there; he could not well keep his eyes more open for everything along the way than they were at those times. openest of eyes, he said, could not have helped matters then.

"What was the first thing that happened?" He repeated my question. "It was nothing much, so far as the harm done amounted to. But it hinted that my luck had turned. Do you remember how, back there a little ways, we ran through the edge of a village? Perhaps you did not notice where the track keeps close to the sidewalk as we make a sudden curve. Just at that point there is a white house, a story and a half, with a picket fence. It was a Sunday morning, and it seems that a young fellow had called at that house with a horse and buggy to take a girl out to ride. He hitched his horse to the picket fence and went inside to wait while his girl was putting on her Sunday go-to-meeting best—though it was go-to-ride best in The horse was up on the this case. sidewalk, stamping a hole in it and making a muss of things, and now and then he would take a gnaw at the fence to fill in the time. I didn't see him doing it, of course, but I took particular notice of the fresh-gnawed pickets and the stamped-up sidewalk when I stopped and looked round at things that day. The horse was up on the sidewalk, as I said, and the buggy stood across the track. I came along as usual, not expecting anything but a possible hail from a waiting passenger. I was close upon

the team before I could see it: I slapped on the brake, but there was no time to prevent what happened. In a jiffy the buggy was smashed into kindling-wood: the car took it in the stern quarter. Luckily, the horse was not hurt; he stayed hitched to the fence, kicking and prancing like all possessed. Everybody came rushing out of the house; the young fellow had a Sunday paper in his hand; the girl was in a wrapper and her hair was half done up. But she was a pretty girl. 'What in thunderation did you do that for?' the young man asked me, looking at the splinters of his 'What did I do it for? What buggy. did you do it for? Don't you know any better than to hitch up your team across a car-track on a curve?' I asked him He had some sense in him after back. all, for he cooled down and allowed that it was his fault, sure enough. 'Well, I'll know better next time,' he said, as he looked carefully over his horse. seemed it was his own team. Etta,' he spoke to his girl in a sort of good-natured tone, 'we'll have our ride anyway. You may as well go in and finish getting ready while I take the horse down to the livery and hire another buggy.'

"Well, everything went all right again for ten days after that. Then—but you must have noticed how just now, while I was talking, we went down a short, steep hill into a hollow, where a stream runs across the road. We were on our last trip, and it was after midnight. There had been a heavy downpour that day, and the stream, ordinarily a little brook-like affair, was running bank full and several feet deep. I took the hill as usual, cautiously, for a steep grade and a track not over good. But when we struck the bridge, down went the whole thing; the car gave a slew and pitched through the rail down into the The flood had undermined one of the abutments, leaving the bridge hanging by its timbers. But apparently it was whole as ever when seen from I was slung sidewise off the platform into the water, nearly up to my The passengers all got a ducking, neck. But nobody was badly hurt, though such a shaking up made some heavy

bruises for some of them. It was pretty uncomfortable for us to walk, dripping wet, a quarter of a mile to the next farmhouse, where we roused up the folks and borrowed blankets and any other old things they had to wrap ourselves in. Luckily, it was a mild July night. A relief car got to us in about an hour. The telephone signals came in handy just then.

"Now for the third thing. There was something rather funny about that. I had a narrow squeak of it, but I can't help laughing every time I think of it. It happened right here, where we are. See, on the other side of the road there, that patch of new fence in front of the house with a new piazza? The company paid for that fence and for that piazza, and for something besides. you see, the way curves moderately to the right along here. Only six days had passed since we pitched into the river, and again it was our last trip. We were going full speed, controller-handle at the top notch. But just where the curve begins we struck a loose rail, and were off the track before I could think. car veered diagonally across the road; on she went, crashing through the fence, smashing into the piazza of that house, bunting into the side of it, and shoving the whole blessed thing back fourteen feet off its underpinnings. As we went bumping over the ground I kept my place; perhaps I couldn't have jumped off if I had tried. The car smashed in the side of the house, and the first thing I knew I was in a bedroom, head and shoulders just above the level of the Right opposite a man and his floor. wife were in bed, half paralyzed with fright, of course. I still stood clinging to the brake. 'Good-evening!' said I, not thinking. Then, 'Beg pardon!' 'I should say so!' said the man. 'A pretty way to come into a man's house without knocking.' He was one of the hot-tempered sort, and he was mad as a hornet. Under the circumstances I didn't blame him much, though he seemed to think I had done it on purpose. But I couldn't help answering, 'Without knocking? It may not have been knocking, but it made noise enough, anyway!' I got some scratches that time. See here?" We had come to a siding, and were waiting for the down car. He pulled up his right sleeve, and there from his wrist up was a long, heavy scar, freshly healed.

FRENCH FICTION OF TO-DAY

BY GEORGE McLEAN HARPER

Professor of English at Princeton University

UMAS and Balzac are the two extremes and the two supremes in French fiction: Dumas the delightful, who dissipates reality with its hard laws and awkward facts, who draws a magic circle within which there are no ten commandments, no cruel and prosaic relation between cause and effect; Balzac, at his best, the scrupulous observer, the unsparing moralist, the profound interpreter of manners. many of us the thought of a French novel evokes memories of something delicate and light, something gay and fragile, themes fanciful and diverting, a style rapid and sparkling, an effect as unreal, unmoral, and harmless as that of the "Arabian Nights." Happy are the read-

ers who have rested content with Dumas and are able to retain this conception of French novels. Better informed, though probably not so happy, are they who have studied with Balzac the actual state of French society in his time, in the borings which his relentless drill brought to the surface from various strata, and classified in the Comédie Humaine. The genius of the French nation expressed itself no less characteristically in Balzac than in Dumas. A gift for accurate analysis and a gift for the playful exercise of wit and imagination have had an equal share in making French literature.

I venture to suggest that a third and far more numerous variety of fiction, the

sentimental romance, is not so permanently satisfying—that variety of fiction which is too pretentious to be diverting, and in which observation is oblique. The glow of George Sand and the force of Victor Hugo do not avail to keep us interested in their novels. Their plots lose plausibility, their heroes and heroines show a touch of the ridiculous, and, above all, the pungent and once so acceptable flavor of their authors' opinions no longer captivates our surprised and delighted sense. Dumas and Balzac we can still read, again and again.

Twenty years ago the sentimental romance was in deep disfavor. To acknowledge a liking for the "Roman d'un Jeune Homme Pauvre" was to expose one's self to the sneers of the connois-This was a wholesome turn of The cry was all for naturalism; and a genuine naturalism is a quality in novel-writing which is always in order, the safe cure for nearly every affectation and perverted habit. For the last twenty years, however, French novelists have been deserting the standard of natural-They tell us themselves that they have departed in search of the ideal. Five at one time, in the manifesto "des Cinq," and one by one nearly all the others, they have abandoned the colors raised by Balzac and defended, in the face of misfortune, by Flaubert, Zola, and Maupassant. In the face of misfortune—because these lieutenants, retreating from the fairly wide field dominated by Balzac, committed the fatal mistake of restricting their operations to a narrow territory, so that naturalism, in the popular mind, came to mean a study of horror and filth, a record of the abnormal. Zola especially was in a false position. He passed for a naturalist and thought himself a naturalist, but was nothing of the sort. He always was a romantic (M. Doumic and M. Pellissier would say a poet): a man whose powerful affections and hatreds, whose distorting imagination, found at last their true sphere in polemical politics and his later books of tendency.

There is at present no triumphant "school" of French fiction. The echoing porticoes are deserted. Every doctor assembles his group of hearers in his own

little booth, whether it be built of corrugated iron or woven of green boughs; and their teachings suffer for want of the discipline which lies in a common aim and mutual encouragement. Few of these men possess anything like the virility or the intellectual scope of Balzac; and for all the influence his vigorous theory and glorious example exert upon the methods of most contemporary French novelists, the great master of their art might as well have never lived. In the present reaction against a debased and starved form of naturalism, almost all French novelists have renounced allegiance to Balzac, who has been more honored by Turgeniev in Russia, by Mr. Howells in America, and by Galdós in Spain than by any French disciple except Flaubert.

M. Paul Bourget is known as a psychological novelist, and it seemed for a while as if he were to have a following; but his report of the human heart was too discouraging and far too abstruse. And as soon as his first three or four books had appeared, it began to be evident that it was only his own personality, after all, that he thus excruciatingly analyzed. Ever does sentimentalism betray itself in its absorption in the Ego.

M. André Theuriet is known as a student of country life. Like Daudet, he is a poet who once passed, with some profit as well as loss, through the naturalistic discipline. His pleasant and amusing story now current in the "Revue des Deux Mondes" has its pedigree marked all over it: sired by Tartarin, out of Maupassant, with the redoubtable Balzac strain evident from withers to fetlock. Alas! experience has taught us to look for the weak cross to crop out somewhere, and it will probably not be long before the hero falls a victim to "irresistible passion," discovers himself to be an exception to the laws of the universe, suffers remorse, undergoes a religious experience, and dies (or, modern style, lives) forgiven.

M. Pierre Loti is the colorist, the poet of the sea and foreign strands, seductive bearer of the lotos; and, by virtue of his magical descriptions and a certain poignancy of pathos, he almost makes us forget how slight is his range

of human observation and how completely negligible his philosophy.

In the younger generation—for Bourget and Loti, as well as Theuriet, are already elders—sentimentalism, variously modulated, is the prevailing note. What the sentimentalists of the early part of the nineteenth century, Chateaubriand, Benjamin Constant, George Sand, owed to Rousseau, most French novelists of to-day owe to Renan: a habit of exalting their own memories, feelings, and doubts into the place of general principles. was open to them to observe life faithfully or to create a diverting and wholly fanciful world. They have done neither this nor that, but have, for the most part, aspired solemnly to instruct us, out of the shallows of an exceedingly limited personal experience. Their observation is subjective. Exquisite as their workmanship very often is when they describe externals, they gladly return to the contemplation of self or projections of self. Thus, though the several "schools" which existed in the eighties are broken up, we have not escaped monotony of type. It is nowadays the husband, rather than the wife, who commits the crime with which it is the business of novelists to make people acquainted in all its This is an improvement over the old plan, and shows that the epoch of studying "human documents" bore some fruit. Nowadays, too, he resists temptation, where formerly he melted like wax before a fire; but his resistance is always in vain, and ends in a shrug and the exclamation tant pis! He is a névrosé. The temptress has des yeux inquiétants. He experiences malaise, becomes énervé, suffers a terrible insomnie, and has one or two crises nerveuses. Subsequently he misses the consolations of faith. His religious yearnings are painful to witness, and we are not spared the details. In all this there is no adventure, in the breezier sense of the word, no outdoor struggle with nature or fortune. The men are sedentary or perambulatory of habit, and rarely work for a living. Sometimes they write books or plays. Sometimes they are officers. Frequently they bear the title of count or marguis. Very often there is a tragic ending. A horsewhipping? Shooting?

Oh, no! The mistress dies, and over her memory the forgiving wife and repentant husband mingle tears of reconciliation. This pretty plot is a composite made chiefly from M. Marcel Prévost's "Heureux Ménage," M. Paul Margueritte's "La Force des Choses," and Daniel Lesueur's "Comédienne."

It would be disrespectful to a conscientious and talented author to affirm that M. Edouard Rod's novels are built on this plan. Yet without levity we may ask if even his sad sincerity secures him from monotony and the commonplace obsession of the inevitable crime. The same problem preoccupies him: how to reconcile spiritual longings with the gratification of guilty desires. But why does he not study murder or bank robbery, for variety's sake and to escape from the crowd by a sure and unfrequented path to distinction?

M. Ferdinand Fabre belongs to the generation of M. André Theuriet. He was born in 1830, and M. Theuriet in 1833. It is possible that they both will interest a wider and more loyal public than M. Loti and M. Bourget, who were born in 1850 and 1852. They were trained in the days of a sound naturalism. which greatly modified, but did not pervert, their original endowment of poetic M. Fabre's work is worthy of special mention, and is enjoying an Indian summer of praise in high quarters. is almost wholly concerned with the life of peasants and village priests in the Cévennes mountains. He writes of them. not with irony and condescension, not in a hostile spirit, not even in an attitude of detachment, but with loving sympathy as becomes a man who was brought up in their midst and swung the censer ir his boyhood. He is not blind to the peculiar foibles of a celibate clergy. analyzes their temptations, their sacer dotal pride, the avarice and love of powe that beset men of intelligence ruling ignorant parishes, their danger from hypocrisy, the demands of the fles writhing under ascetic repression. he accepts gladly the well-known fac that in the main the country priests c France lead humble, pure, and beneficer lives, and his books are encouraging His peasants are not the base brutes

Zola's "La Terre," nor the saccharine toy-figures of George Sand. And, above all, his people are shown at work. If one were to gain one's knowledge of the world entirely from novels, no matter in what language, one might fancy that "all the year were playing holidays." Lovemaking, and in French fiction l'amour, which is another thing, would seem to be the principal occupation of mankind. Apparently people eat manna and do not have to work for a living. In the books of M. Ferdinand Fabre the characters have their bread to earn and we see them do it. This is a distinction which belongs to Charles Reade's novels also, and is no trifling part of his honor.

To have depicted clerical life in a few highland villages—the bare, austere presbytère, the confessional, the visits to sick and erring farm-hands—may at first sight appear a small achievement, parochial in every sense. But to describe any corner of the world as completely as the limitations of art permit. preserving the proportions of good and evil as they actually are, is no insignificant task. It is humanity, it is nature, that M. Fabre has studied. His success as an observer is unquestioned. Owing to his fine poetic quality and the happy fortune of his choice of scene, his novels are full of sunshine. They are almost isolated amid the general gloom of contemporary French fiction. Is there a blue sky nowhere in France save only above the blessed pays cévenol?

Among the best-known works of M. Fabre are "Les Courbezon," "L'Abbé Tigrane," "Mon Oncle Célestin," and "Lucifer." They are not quite so much read as they deserve to be—a fact which M. Pellissier, in 1897, attributed to "the seclusion in which he has lived, his aversion to playing the lion and advertising himself, and even his choice of subjects, which allure neither curiosity nor a taste for scandal." Some of his most delicious pages are in "Le Chevrier," a book written almost entirely in the savory poetic diction of the Cevennes.

The good Balzac tradition and the advantages of sympathetic local experience have another vindication in the novels of M. René Bazin. His earnest study of

the social and political situation in Alsace, "Les Oberlé," temperate though zealous, reasonable though bitter in its arraignment of the German administration, is justly celebrated as one of the most solid works of contemporary French literature. It is the story of a young Alsatian whose family served and suffered in the French cause during the war of 1870-71. His father, a wealthy manufacturer, ambitious to sit in the Reichstag, gives the boy a German education and tries to force him into compliance with the new order. The son is enrolled in a cavalry regiment, but deserts and flees across the border into France, the country of his choice, leaving home, mother, sweetheart, and all his prospects. It is much more than a problem-story. It is a broad, full picture of reality, carefully drawn and filled with color. "Donatienne," a tale of Breton peasants, is perhaps less firmly handled, though it is richer in poetic beauty. It is neither morose nor stupidly optimistic. M. Bazin is a writer of great promise. Let us hope that he, too, will cultivate seclusion and avoid self-advertisement.

Of gavety there is scarce a touch in contemporary French fiction. It is didactic. It is somber. It carries a message of woe. Those writers especially, like M. Paul Margueritte, who have passed through a period of training under Flaubert, Maupassant, and the Goncourts, seem to have dedicated themselves to the sorrowful task of alarming a world from which faith is taking flight, a world that is threatened with a return to promiscuity and barbarism, and which, nevertheless, in its acute self-consciousness, feels itself capable of noble devotion to the highest ends. Perhaps it is too much to ask that these prophets should be cheerful. Their industry is admirable. Their earnest endeavor to investigate deep problems is worthy of respect, though often misapplied. Their skill in the art of writing is almost invariably of a high order.

There are thousands of us Englishspeaking people who feel that we receive a kind of pleasure from French novels which the fiction in our own language does not afford. I hope it is not disrespectful to avow that the reading we desire, and so often look for nowadays in vain, is something more slight, it may be, but also more lively, more exquisite, more artistic, than what we find at home. We have learned to look to France for gayety and can hardly shake off the habit. No one but a Frenchman could have written "Les Trois Mousquetaires." It were a pity if the increase of seriousness in France should make mere excellent narrative of that order a lost art. No one but a Frenchman could have charmed us with the "Lettres de mon Moulin," redolent of marjoram and thyme. Dau-

det possessed the secret of an elixir, half of human joy and sorrow, half of natural magic. Who but a Frenchman could have been so preposterous, yet so entirely plausible and always entertaining, as Jules Verne? Possibly we ought to care more than we do for the heart-rending researches of M. Rod and M. Bourget. The fact, however, is that what we ask of French fiction, perhaps unreasonably, is that it shall amuse us, freshen our wits, widen our horizon, and satisfy-our craving for a light and joyous art.

SOME ASPECTS OF MORMONISM

BY G. A. IRVING

ANY are the view-points from which one may see Mormonism. There are the books which have been written during the past half-century—some of them true, some greatly exaggerated, nearly all seeking to show the evils of Mormonism, and most of them describing conditions which, however it may have been in former times, do not exist to day.

Again, there are the reports of would-be investigators of Mormonism, of news-paper writers and others who have gone to Utah and gained their information first-hand. They have talked with the leaders of the Church and with resident Gentiles; have attended Church services and visited schools. Various and often diverse have been their findings. As a rule—somewhat on the principle that one always finds what he is looking for—they have brought back only ill reports of Mormonism and the supporters of that faith.

Then once more there are the recountals of the detailed missionary and other Christian worker who has lived among this people. He should be in a position to know whereof he speaks. But from the very nature of his work, and the attitude of suspicion and hostile criticism which he often assumes on engaging in it, he is often blinded to the good of Mormonism; or, indeed, he does not touch it on its better side. And when

he writes to his Eastern friends, or comes East to report on religious and moral conditions in Utah, between the evils which actually exist and his desire to gratify his hearers' expectations, he is prone to emphasize the dark side and to forget, if indeed he has ever discovered. that Mormonism has its fair side as Most of us are willing to admit that there is good in all religions—excepting Mormonism. We find commendable features in Confucianism, Mohammedanism, and Hinduism; in Christian Science, Spiritualism, and Theosophy; but Mormonism—is there anything good associated with it or springing from it?

Now, the writer is not a Mormon or a lover of the Mormons save as he is a lover of mankind. But he has lived among the Mormons. He has come into intimate contact with them in business and social relations; has discussed with them religion and politics; has met them in their homes, their churches, their schools; has known them as neighbors and has not been ashamed to call them friends. With unprejudiced mind he has sought to learn their point of view and so to know and judge them. And he has little sympathy with the unsparing criticism and denunciation of Mormonism which abound on every hand.

Their religion, as a body of doctrine, appears to him rude, grotesque often, utterly unphilosophic, and at odds at

many points with Christian doctrine and the highest instincts of religious truth. However, there is such a thing as a man being better than his religion. The early Puritan was kinder to his fellowmen than the God whom he worshiped was to humanity. As a friend, a neighbor, a citizen, a member of society, the modern Mormon is far in advance of Mormonism, the religious system. More yet is he in advance of the common conceptions of Mormonism.

A lady from the South, passing through Salt Lake City, told recently how, on a train coming thither, a gentleman was most courteous and kind to her and to the members of her party, explaining points of interest and otherwise manifesting friendliness. "I was so surprised." she said, "to learn that he was a Mormon"! Really, the Mormon, in humanitarian instincts, is very much like other people. He loves his wife and children; he is a loyal friend and kind, sympathizing neighbor; he is honest and truthful. Exceptions? Yes, just as in every other state of civilized society. There are Mormons who are unkind to their families, who are lacking in altruistic feelings. who are dishonest, untruthful, and otherwise disloyal in their social relations. I know there are those who will report otherwise; but, for myself, I have not observed that in these regards the Mormon differs much from the average citizen of our land. I have lived in a number of States, and in no community have I seen fewer locks on doors than in Utah. Nowhere have I found personal safety more secure and property rights more respected. Nowhere have I observed greater kindness between man and man. Nowhere have I witnessed higher regard for the living or deeper respect for the dead.

True, when it comes to business relations there is a good deal of the spirit of the Jew first, then the Gentile. Naturally enough, the Mormon favors his own. So is it often among Gentiles. Yet if a man is honest, industrious, skilled in his line of work, above all inclined to be friendly ordinarily (aside from the fact that he will be beset behind and before to embrace Mormonism), he will not find Utah so bad a place in

which to live and prosper—even if he be a Gentile.

I am convinced (and here again I take issue with some) that the Mormons as a people are sincere in their religious views and teachings. Devotion is generally a proof of sincerity, and I have found the Mormons more devoted to their religion than most of the people among whom my lot has been cast. They believe that Joseph Smith was a prophet of God as implicitly as Christians believe that Christ was sent of God. They have full assurance concerning special divine revelations and manifestations to their lead-In their willing blindness they believe that the whole truth of religion is with them. The world is wrong and they are right. The troubles (persecutions they call them) through which they have passed, and are passing, are the testings of the faithful: the lot of the people of God in every age. They are as an oasis in the world-wilderness of sin, the chosen of God, special objects of divine care and recipients of heavenly favor. Deeply instilled into the minds of their people from earliest years is this teaching that they are God's chosen ones, and that their religion alone is With this religion they are perfectly satisfied. The blindness of the " world " they deplore, and the followers of other faiths they pity. Theirs is the assurance of ignorance, of delusion, of perverted teaching. But what of that? It is their religion, and they believe in it with heart and mind and strength.

Whatever one may think of their religious teaching and belief, he must at least respect their sincerity, their devotion. This last is of the Puritanic. meetings of a Sunday are crowded. Every one expects to attend, and in turn is expected to do so. Not less are their Sunday-schools and week-day religious classes and services enthusiastically supported. They send out their missionaries-often at great sacrifice-more in proportion to their numbers than any other body of religionists. They pay their tithings, though I am inclined to think with increasing reluctance and the growing demand to know the uses to which these funds are put as their intelligence increases. They submit them

selves to the requirements of a religious system more personal and controlling than any of which I happen to know. The Church, with its teachings, its demands, the blessings it bestows and will bestow, is ever present in their thought. They glory in it, and toil and sacrifice for it.

This I say of the people in general. I cannot say as much for their leaders, apostolic and otherwise. Of their sincerity I am far less assured. I feel that they are too intelligent and discerning to themselves believe much that they My observation has been that, as a rule, they reach their positions of authority not because of spiritual or religious fitness in any sense, but because of general ability and shrewdness. Often the local bishop is the most successful business man in his community. Typically he is suave in manner, affable in speech, and skilled in handling men. He must see to it that the work of the Church prospers; that the people are properly instructed; that they continue loyal and submissive; that the tithings are paid. He is a sort of general manager for the Church; nothing more, very often. Rumor has it (current among the less loyal Mormons and the Gentiles) that rare is the bishop who does not become rich through his official position.

I have found that most people outside of Utah confound Mormonism with polygamy. The two terms are far from being synonymous. Formerly, polygamy was the distinctive doctrine of Mormonism. Now, so far as its practical bearing on life is concerned, it is fast becoming derelict. The rising genera-Not because tion will have none of it. it is contrary to the law of the land—for the Mormon, like all earnest religionists, rightly esteems religious law as above statute law—but because it is contrary to a law of the human heart. In truth, it never worked satisfactorily and never could. Rarely a plural marriage still; but the social sense of the Mormon community is against it. The man with plural wives is often an object of ridicule to Mormon girls. The wives themselves are objects of pity. For themselves, the girls of education and independent thought scorn the idea of plural marriage. Nor do the rank and file of the young men favor it. It is the grizzled bishop of an earlier day, or the man of wealth and power, who would follow in the footsteps of the elders. But often—more often than he would like it to be known among his brethren—his advances meet with scornful refusal. As a rule, the Mormon men are not rich in this world's goods, and now that women are fast assuming their rightful place among them, few would care to undertake responsibility for more than one family. Polygamy in Utah has had its day.

Not so with Mormonism. It will not be overthrown. It will not die out. daily increases in the number of its adherents. It appears to lose nothing of its power. Its hold upon the affections of the people seems not to become Really, it is about the whole thing in Utah. Its rule in politics I believe to be absolute. Its control of the industrial situation is all-pervasive. Outside of two or three larger towns, every public school in the State is, in all but name, a Church "There is never a real political issue in Utah," said a Gentile, a longtime resident of the State, at the time of a recent State election. "There are no politics here. The parties are figureheads merely. Everything is settled long before election. I do not know which party will win out in this election. The Mormon people do not know, but the Big Twelve do. Why should I waste my time going to the polls?" Likewise the "Big Twelve," as my friend calls the twelve Apostles of the Church, hold within their hands, or at least control, all the leading industries of the State, with the important exception of mining. So, too, their hand is seen in the direction of the public schools. winter orders went out from Church headquarters to the school trustees of each town in the State (and at the same time were widely published throughout the country) that the public school buildings should no longer be used as places for religious instruction. " Have you given up your religious classes in the schoolhouse?" some weeks afterward I inquired of my Mormon neighbor. indeed," said he, with a smile. "It was

not intended that we should." In Utah to-day every department of a man's life, spiritual, mental, political, industrial, is directed, and in the main controlled, by the high and powerful Church officials. The Mormon Church is the most comprehensive and inclusive hierarchy that the world has known.

The immediate future of Mormonism I believe will be determined largely by the attitude of our people and country toward it. Mormonism has been and is to-day misjudged. Its evils have been misunderstood and often greatly and grossly exaggerated. Its impending danger to our country has been wonderfully overestimated. Men have spent their time in passing condemnatory resolutions instead of seeking the wise remedy. The Mormons are not a large body-by the highest estimates they do not number a half-million people. They are below the average of our people in intelligence. But they are American citizens, and more and more are entering into the spirit of their citizenship. They are making marked progress in education and enlightenment with every year that passes. Most of all, they are human beings looking toward the light.

It is not persecution or virulent speech or denunciatory resolutions that will help the situation. Mormonism is not to be blotted out. And in the future, as in the past, excessive denunciation and persecution will but serve to fortify it in its present form and retard its modification. This last I believe to be the ultimate future of Mormonism. Some of its objectionable features have disappeared and others are fast disappearing. With time and enlightenment and a larger infusion of the American spirit of liberty, crudities of doctrine and

hard and fast ecclesiastical control will alike pass away. Mormonism will survive, but not the Mormonism of the present—least of all that of the past. Mormonism will some day take its place as a reputable and respected religious system. It will have a recognized place among the religious sects.

It is folly to talk of its overthrow or extinction, or to work to these ends. is wisdom and sound sense to seek its modification and betterment. Instead of denouncing Mormonism by wholesale, let people inform themselves as to the actual situation of the Mormon people. Instead of passing resolutions of contempt and condemnation, let them seek to liberate their Mormon countrymen through such means as alone can succeed. Instead of spending vast sums in antagonizing them, let our people provide liberally for their moral and religious and educational and civic enlightenment. Christian schools exist in Utah—a few. Christian churches are there-also a few. Some of these have of late years been abandoned, not because they were not needed or because their work was without results, but because they could not be adequately supported.

Would the philanthropist do something worth while for Utah? Let him put a Christian church in every town and hamlet in the State, and place in charge of these churches broad-minded men who will make them first of all centers of moral and religious education. Let him plant schools in places where only a narrow, sectarian, insufficient education is provided. Let him build libraries— there are now less than a half-dozen in the State. This, better than anything I know, would hasten the cure of Mormonism.

AMULETS

BY CHARLOTTE PORTER

If thou shalt ever see with inner sight, No outward gaze of thine but will be bright, Kindling in thee and all who meet thee—light!

If thou shalt ever feel with heart awake, No sin and tears but shall thy sorrow slake, And round the evil good's fair halo make.

SAFEGUARDING THE INDE-TERMINATE SENTENCE

BY SAMUEL J. BARROWS

President of the International Prison Congress

HREE important contributions to modern criminal law and criminal procedure have had their origin and application in the United States. One is the establishment of a system of probation applicable both to adults and minors, the second is the organization of juvenile courts, and the third is the adoption of the indeterminate sentence. Juvenile courts have grown up within the last five years; probation has been in operation for some twentyfive years; the indeterminate sentence has been in operation in New York, the pioneer State in this reform, since 1877. It is not surprising that these innovations in the field of criminal law should have attracted the attention of European jurists. Probation, in the form of a suspended sentence and without the salutary provision of the probation officer, has long been in successful operation in France, Belgium, England, and to a small extent in Germany. The idea of the Juvenile Court was received with enthusiasm at the International Prison Congress and commended to the attention of all the nations represented. The indeterminate sentence has not been adopted by any European nation, but has been the subject of repeated discussion at the Congress referred to, and also in the International Union for Criminal Law. It has found prominent advocates in Van Hamel, of Holland, Guillaume, of Switzerland, Saleilles, of France, and De Sanctis, of Italy. Within the last year two doctors of law from the University of Berlin, and Dr. Freudenthal, professor of criminal law in the University of Frankfort, have come to the United States especially to study these new aspects of American criminal law. Dr. Freudenthal has given especial attention to the principle and implications of the indeterminate sentence.

The arguments for the indeterminate

sentence which are influential in Europe are precisely those which are influential here. The best criminal code is an arbitrary instrument, and it is impossible to construct one on any principle so that the penalty can be made to fit the crime; still more difficult is it to make the penalty fit the offender. No legislator can show why the theft of twenty-five dollars should be punishable with one year's imprisonment, and the theft of twentysix dollars with five years' imprisonment. Nor is the difficulty removed by empowering the judge to use his discretion in imposing sentence within certain limits of minimum and maximum. A judge would find it hard to tell why he sentenced one boy five years for stealing a dollar and another boy one year for stealing \$186, or another judge why he sent one boy to prison for a year, and another, a first offender, to sixteen years for the same offense. A study of codes on one hand and of sentences on another reveals an amazing amount of contradiction and confusion, not to say rank injustice, in the application of penalties.

For this inequality and injustice the indeterminate sentence furnishes the necessary relief. Instead of making the code-maker or the judge decide when a man shall come out of prison, it puts the main responsibility of deciding that question upon the prisoner himself. What the judge decides is that the prisoner has had a fair trial, and what the jury decides is that the prisoner is innocent or guilty. In the latter case the judge may put the offender on probation, or it may be shown that he must be removed from society until fitted to come back to What the State then does is to provide a new environment for the offender, an environment where he shall be made better instead of worse. It puts him under a whole range of reformative influences, moral, physical, and intellectual. The State then says to him: Before you can go back to society you must prove that it is safe for society to let you come Here you must fulfill certain conditions. Like a boy at school, you must pass through a certain number of grades and attain a certain number of marks before you can graduate. If you fulfill all these conditions as to work, education, and deportment, you may get out in a year and a half, or you may stay here ten years, which is the limit fixed by statute for the offense you have committed. Whether your detention shall be eighteen months or ten years depends most of all upon yourself. You are to this extent the master of your own fate. Here is a ladder upon which you can climb. You cannot go out till you have reached the top round, and then only conditionally. In other words, you must earn your parole in prison, and you must earn your absolute discharge when you have been released conditionally.

The indeterminate sentence is not, then, a passive punishment; it is something better; it is an active discipline; it is an opportunity. It is an opportunity for moral and intellectual enfranchisement which liberates the man from himself. It opens to him a new future. It means not relentless suffering for something that he has done, but relentless endeavor for something which he is to become. The truest proof of repentance is reformation. No reformation can be secured without suffering, the suffering of discipline; but the discipline which reforms is not the discipline which crushes.

It is evident, then, that the indeterminate sentence has no meaning unless it is connected with an active reformatory system. To send men to prison where there is no labor, no schools, no incentives to self-development, is merely a parody upon the true principle of the indeterminate sentence, which is a very different thing from a definite sentence shortened a certain number of months for good behavior. It is important to sound here a note of warning. Certain States have adopted what they call a parole system. Men are released conditionally after they have served a cer-

tain time. Their eligibility for parole does not depend upon what they have done in prison, but on what they have not done. They have observed a somewhat easy set of prison rules; they have given the keepers no trouble. Habitual criminals easily adjust themselves to such rules. Such parole laws may not be entirely valueless, but they are in no respect synonymous with the indeterminate sentence; they are calculated rather to bring it into disrepute.

When, under the indeterminate sentence, a prisoner has earned his parole by fulfilling the conditions required, the parole is authorized by the board of managers or the board of parole constituted by law for that purpose. Unfortunately, in some States this board of parole has allowed itself to be influenced by personal and even political appeals. The very fact that there is no marking or grading system in some of the prisons, and therefore no standard of excellence required of the prisoner himself, except of a negative character, and that the board has little to guide it in an individual case, leaves it open for external appeals. Under the reformatory system as administered at Elmira, the principle is strictly adhered to of making the prisoner earn his own release, and all outside influences except those necessary to secure employment for the prisoner on parole are absolutely excluded. Bosses have long since learned that they have no pull at Elmira. If the value of the indeterminate sentence is to be maintained, boards of parole must be held up to the highest standard of efficiency.

The indeterminate sentence carried to its logical conclusion should have no time limit, either minimum or maximum. As applied to the Elmira Reformatory in New York it has no minimum, but a prisoner can be held only for the maximum period prescribed by the statute for the crime committed. This period, of course, is an arbitrary one. It has an additional disadvantage. A prisoner who serves his maximum sentence in the reformatory receives under the law an absolute discharge instead of being placed on parole, while such a man who has failed to earn his discharge is one above all others who should be released only tentatively. Advocates of the indeterminate sentence in the United States are hoping that eventually the maximum limitation may be removed. One reason why the indefinite sentence has not been accepted by more European jurists is because they feel the difficulty recently stated by The Outlook, namely, the difficulty of safeguarding individual liberty. In Europe, where untold suffering has been occasioned by prolonged and unjust imprisonment for political or other reasons, any form of sentence the duration of which is not strictly limited by statute is looked upon with some dis-At present the maximum limitation fixed by the statute, arbitrary though it be, constitutes a certain safeguard against the permanent incarceration of offenders. And yet it is very clear to all penologists that there are a large number of recidivists or habitual offenders who ought to be permanently segregated from society. A woman in Scotland was sent to prison more than three hundred times. The woman would not have committed two hundred and seventy-five of those offenses if she had not been liberated two hundred and seventyfive times. Is there any mercy or any wisdom in liberating an habitual inebriate or other offender when it is clear that he is incurable without prolonged incarceration? It is one advantage of the system of probation, of the indeterminate sentence, and conditional liberation, that it serves to distinguish eventually between corrigible and incorrigible It is just as important for offenders. society that the incorrigible offenders should be detained as it is that the corrigible offenders should be released. For the incorrigible offender the only course seems to be permanent segregation by the State. How, then, shall individual liberty be guarded?

The answer is not difficult. All the protection which is now furnished by having a maximum limit of detention can be secured by law and in a better way. It can be secured, first, by having the judiciary represented on all boards of parole. Two steps in this direction have recently been taken in the State of New York. In reference to the Bedford reformatory for women it is provided

that when the question of paroling an inmate comes up for consideration, the committing magistrate shall be informed, and shall have a vote in deciding the question. A more important step in the direction of securing judicial support and responsibility has been taken in the recent law providing for the New York City reformatory for misdemeanants. The board to develop and manage this institution is composed of nine members, four of whom are judges from the courts of New York which commit misdemeanants to this institution. The other members of the board are appointed by the Mayor, and include the Commissioner of Correction. The objection raised, that the courts can have no participation in deciding the release or detention of a prisoner, is removed when four out of five members of the paroling board are judges.

The same principle can be applied to habitual criminals or confirmed repeaters. That they should be detained instead of being liberated under short sentences is hardly questioned. But even here we would have no prison or colony in which all hope should be excluded. No one can tell what a prolonged detention might do, under proper discipline, for some one who under the merciless parody of the short sentence had been regarded as incorrigible. Even among so-called incorrigibles we would provide, therefore, that at stated periods, say five or ten years, the question of conditional release might come up for review, with the right of appeal for the prisoner to a parole board in which judicial, medical, and administrative authority should be represented. The disadvantage of the maximum sentence is that at its termination the man must be discharged, whether he is ready for release or not; under the system proposed release would not be mandatory; the question would come up simply for determination under a form in which no arbitrary warden could control the destinies of a prisoner, and the question of a conditional release under surveillance would be decided, not because of an arbitrary time limit affixed to an offense, but because of a thorough study of the character of the offender. is the supreme advantage of the indeterminate sentence that it depends, not upon the arbitrary time limit of the code nor the caprice of the judge, nor that of the warden, but upon the character of the prisoner under a system constituted so as to develop and reveal it. There is no reason why this, the only rational method of determining the duration of imprisonment and of making imprisonment effective, should not be applied to all classes

of prisoners, whether felons or misdemeanants. In several States the marking and grading system it requires has been applied to State prisons.

The indeterminate sentence has run the gauntlet of all sorts of appeals as to its constitutionality. It is a principle which has come to stay. But if it is to be successful, we must have the real thing and not a feeble imitation.

THEOLOGY—NEW AND OLD'

THE New Theology is a new doctrine, a new method, and a new spirit; but it is more a new method than a new doctrine, and it is more a new spirit than it is either a new doctrine or a new method. All three aspects are illustrated by the books here reviewed.

Dr. Charles Cuthbert Hall, the President of Union Theological Seminary, is a modern thinker with an orderly mind, broad sympathies, and a devout spirit. Known widely as an excellent preacher, a remarkable pastor, and a wise administrator rather than as a profound scholar or an acute metaphysician, his success as a preacher to India was scarcely less a surprise to his best friends than it was to himself. That success was due to the fact that he brought to this unique ministry the habits of the preacher and pastor rather than those of the scholar and the metaphysician. The three years of his special preparation were devoted to the study, not so much of the theme which he was to present as of the people to whom he was to present it. He had learned in his pastorate what the scholar and metaphysician do not learn, what unhappily many preachers and pastors never learn—that the instructor's acquaintance with his audience is even more important than his acquaintance with his subject. "I desired," he says, "to be a humble learner from the systems of belief that commanded the allegiance of immense numbers of my fellowmen and that represented the insight, research, and aspiration of long lines of eminent and saintly personages." His study, it will thus be seen—and the reader would see it more clearly if we had room for fuller extracts—was conducted, not for the purpose of discovering errors to be combated, but truths to be appreciated. It was, in other words, a sympathetic, not a critical, study, and with this result:

From time to time, in this course of preparation, the conviction has recurred with increasing definiteness that the East could, if it would, give more adequate expression to Christianity than the West ever has given; that India might, if it would, express the innermost secret of Christ with an exaltation of tone, an emancipation from the thralldom of things visible, a grasp on the eternal, the invisible, the imperishable, never yet attained by the average thought of Europe and America.

Going to India in this spirit of appreciation, he found, rather let us say evoked, a like spirit of appreciation from his hearers for Christianity; frankly avowing that he found in the Orient something that the Occident had never taught him, he prepared his hearers to find in Occidentalism something which the Orient had never taught them. Less an orator than Dr. Barrows, less a philosopher than Dr. Fairbairn, he achieved a success so far exceeding anything that they had achieved that he has been invited with the enthusiastic approval of his Hindu audiences to repeat his visit. The reason for this success has been

The Christian Faith. By Olin Alfred Curtis. Baton & Mains, New York.

thus stated by a Hindu writer, Mr. Malabari, in the "Voice of India," published in Bombay:

The third Haskell lecturer has just finished his course of lectures in Bombay. Of all the Haskell lecturers, he has treated Hindu thought with the deepest sympathy, the greatest veneration, and the keenest insight. Dr. Barrows spoke like a Christian imperialist he had a true American for the control of th ist; he had a true American eye for grand-eur, and he seemed to be preoccupied more with the thought of the religion of Christ conquering and overspreading the whole world than of its transforming humanity from within. Dr. Fairbairn was a man of commanding abilities and had a wonderful grasp of the most important teachings of the East. With a minimum of words—and those East. With a minimum of words—and those accurate, graceful, and effective—he could present a substantially correct view of the most mysterious Indian doctrine-its content and its limitations. But, while the intellect was in it, his heart seemed to stand aloof; he seemed almost to say that Eastern and Western thought shall not travel in the same compartment. This aloofness is bridged over by Dr. Cuthbert Hall. Not a word escapes his lips which is consciously derogatory of other religions; he not only professed veneration for the highest religious aspirations of the Indian mind, but every word of his rings with the genuineness of that profession. His Christian experience takes Indian experience cordially by the hand, and seems to delight in its company, if only to invite the onlooker to compare and to comment and to choose.

Dr. Hall's lectures are not only pervaded by this spirit of open-mindedness, this spirit which enables him to understand the thought of those to whom he is better able to bring knowledge, because from them he is acquiring knowledge, but no less by that spirit of devotion which is so distinctly characteristic of Oriental thinking, and so often, unhappily, lacking in our Occidental thinking. No one would criticise his lectures for their emotionalism, yet they are suffused with a feeling which is illuminating as well as inspirational:

My interest in Christianity is not a selfish or sectarian interest. . . . I love it because I have no proprietary rights in it and no sectarian claim upon its benefits. I love it as I love sunshine and clear air, and all the gifts of God that belong to no one, simply because they belong to all. I love it as I love liberty and the progress and the rights of men, because these are universals and not particulars. I love it because I believe that essentially all men are one in their fundamental feelings, needs, and aspirations; and because what so completely meets the fundamental needs and answers the deepest aspirations of some

seems as if it must be meant for all; as if it must be the thing that has come at last, after ages of human hope and fear, from the heart of the good God to satisfy the yearnings and uplift the hopes of all his children; as if it must be the crown and consummation of all religion, the common goal to which our many upward paths have tended, the "one far-off Divine Event toward which the whole creation moves."

This power to express truth in the terms of feeling, as here the truth of the universality of the Christian religion in the terms of a genuine feeling of universal brotherhood, not only finds for the truth an entrance through the feeling, but makes that truth more clear, because it is a truth of the feeling as well as of the intellect.

But broad sympathy and a devout spirit would not alone give Dr. Hall his unique success. Mated to an orderly mind, they made him more than a great scholar or an acute metaphysician; they made him a luminous thinker, a wise mediator, in some true sense a prophet. He is able not only to see the truth both in the pantheism of the Orient and in the doctrine of divine personality of the Occident, but so to state each truth as to make it intelligible to those who have dwelt with the other. His own clearness of vision, and still more the intensity of his evangelicalism of purpose, enables him to put the truth as he sees it in sentences that shine but do not sparkle, which are luminous but not epigram-

"God is necessarily self-revealing because God is truly personal." "The Incarnation of the Lord Jesus Christ is not the birth of a hero; it is the Revelation of the Character of the Eternal God under the form of time and in the terms of human action." "The purpose of this Manifestation is not the founding of a sect, but the redemption of the whole world."

We are glad that Dr. Hall is going to return to India, because we hope that he will complete the work which seems to us to lack completion. He has put with great clearness the Christian doctrine of the personality of God as revealed in Jesus Christ, but he has not put with any adequacy the Passion of Christ. He states his belief in that Passion, but he furnishes neither an interpretation of the Passion nor an argument to justify faith in the Passion. We find the same lack

in his lectures before Vanderbilt University. Admirable in their interpretation of modern religious thought to a community into which modern religious thinking has not yet found much entrance; admirable as an interpretation of a Catholic faith far broader than any sect and given in a lectureship under the auspices of the Bishops of the Methodist Episcopal Church South, a denomination which cannot be accused of excessive latitudinarianism, they yet halt when they come to the consideration of the suffering Messiah. We agree with him that "the secret spring of that vast dynamic—the Saviour of the World—was the resurrection of Christ as the consummation of his Incarnate Sacrifice rather than distinctively and separately the Act of Death." Yet that resurrection itself gets much of its significance from the preceding Passion. And it appears to us that the interpretation of this Passion is greatly needed at the present time, and, though for different reasons, is an equally pre-eminent need in the Occidental and the Oriental world. It is needed in the Occidental world because the fundamental remedy for greed, selfindulgence, and the accompanying vices of appetite and corruption is the life of self-sacrifice inspired by faith in a selfsacrificing Lord and Leader. It is needed in the Orient because fundamental in the conception of the Brahman is the notion that pain is evil, a notion that vitiates not only sound thinking but sound living, and one which can be corrected only by the teaching that suffering is divine, and that, as the supreme act in the life of Christ is his Passion, so the supremest attribute in God is his ability to suffer.

Doubtless this also is the view of Dr. Hall. No one could put more clearly than does he, in his lectures before the Vanderbilt University, that the philosophy which "defines the essence of Christianity as consisting of the teachings and example of Jesus as recorded in the first three Gospels, rather than that view of the Person of Christ as the Image of the invisible God, and the Work of Christ as the suffering and triumphant Saviour of the world, which is set forth in the Fourth Gospel and the Apostolic Epis-

tles . . . is inadequate as the basis for a reinterpretation of the idea of the Church that can satisfy the religious consciousness of the present time." But why the suffering was necessary to the triumph, or what its relation is to the world's redemption, Dr. Hall does not attempt to consider. To the consideration of this question Dr. Stevens devotes his volume. That volume is not suffused with feeling. It is without sentiment. The problem of suffering culminating in the suffering of Jesus Christ is discussed as a purely intellectual problem. this, to our thinking, is the chief defect of the volume. The problem of suffering is not purely an intellectual problem, and its intellectual aspects can never be understood except as they are viewed through the atmosphere of feeling and interpreted in the terms of feeling. The aroma of Dr. Stevens's book is that of the class-room, as the aroma of Dr. Hall's book is that of the pastorate. It must also be said of Dr. Stevens's volume that it has the appearance of having been delivered as successive lectures, and therefore is weighted with what, for the reader, seems to us needless repeti-The excuse for this repetition is found in the fact that the author approaches his subject from different points of view, interpreting the doctrine of salvation in successive chapters, as taught by the Hebrew prophets, by Jesus Christ, by Paul, by John, and by later ecclesiastical writers. Such a method of approach, or rather of approaches, necessarily involves repetition. For scholastic purposes it is also probably necessary to compare the view which the author wishes to present with the views which have been presented by previous writers.

But though, to our thinking, the critical, not to say the scholastic, element necessarily preponderates, the view to which the author finally conducts the reader is stated with great clearness. On his walk to Emmaus, Jesus said to his disciples: "Ought not Christ to have suffered these things, and to enter into his glory?" The doctrine of the Atonement, so called, is the answer which philosophy makes to the question, "Why ought Christ to have suffered in order to enter into his glory?" It is

difficult to compact Dr. Stevens's answer to this question into a few words; but if a sentence could contain it, that sentence would perhaps be this: Jesus Christ came to earth to manifest God; that he could not do without manifest suffering for the sins of men, for God suffers in and for the sins of his children. Thus it was that the sufferings of Christ "satisfied" the Father. "God never needed to be atoned into love, nor did he ever require from his perfectly holy Son the endurance of unspeakable suffering as a substitute for sin's penalty, for the vindication of his honor or his government. God was satisfied in the work of Christ because it is the nature of the divine love to give, to serve, and to suffer with and for its objects."

This, says the critic, involves the notion that God can suffer, and that is heresy. That this doctrine was once labeled heresy Dr. Stevens frankly concedes, but he affirms that this label was due to imperfect experience and crude thinking. In short, he is heretic enough to believe that men in the twentieth century may also think, and on some subjects may think to better purpose than did the men of the sub-apostolic Church. At all events, his faith in the Passion of Jesus Christ conducts him to faith in what he well calls "eternal atonement."

To me the words "eternal atonement" denote the dateless passion of God on account of sin; they mean that God is, by his very nature, a sin-bearer—that sin grieves and wounds his heart, and that he sorrows and suffers in consequence of it. It results from the divine love—alike from its holiness and from its sympathy—that "in our affliction he is afflicted." Atonement on its "Godward side" is a name for the grief and pain inflicted by sin upon the paternal heart of God. Of this divine sorrow for sin the afflictions of Christ are a revelation. In the bitter grief and anguish which he experienced on account of sin we see reflected the pain and sorrow which sin brings to the divine love.

The old forms of the doctrine of the atonement—that the suffering of Christ was necessary to appease the wrath of God and induce him to forgive; or to satisfy the law of God and enable him to forgive; or to move upon the heart of man and induce him to accept forgiveness—have all proved inadequate and in

some forms of their presentation ethically abhorrent; yet should the Church follow those thinkers who reject from their teaching the passion of Christ altogether, and regard it as a mere incident in a faithful life, it would throw away the chiefest element of spiritual power in Christianity. It must learn that the suffering of Christ is the method by which God forgives sin, and Dr. Stevens's book is to be warmly welcomed and cordially commended because, with perhaps too great erudition, it sets forth this fundamental truth with discriminating clearness and lucid frankness.

The spirit of Dr. Curtis's lectures on the "Christian Faith" is the newer spirit, but the method is a combination of the old and the new methods, the old predominating, and the system of doctrine in no particular differs from the old. The Bible is treated as one book, of practically equal validity in all its parts, and as authority, and apparently final authority, in all matters pertaining to redemption; in miracles God breaks the universal order to contribute to righteousness; the story of the Fall in the third chapter of Genesis is history, though history somewhat poetically portrayed; death is a penalty for sin, and characterizes the whole animate creation because the world is set apart as the habitation of sinful beings—an explanation which makes no account of the fact that death as a phenomenon is not confined to this world; the object of the death of Christ was to propitiate God and was as effectual in changing his attitude toward man as it has been effectual in changing man's attitude toward God. The author's prefatory note leads us to expect a new, unscholastic, human method of dealing with theology: "I want to see, and then help you to see, a real man's real life—not to be caught and held fast by the conventional estimate, not to be swept away by the scientific tendency, but to see myself a real man's real life." But the promise of this sentence is not fulfilled. There is but little analysis or interpretation of human experience. After the First Part the method of the author is largely textual, and when not that, then metaphysical. It is true that

there are suggestive attempts to pour into the old dogmas a more human and vital meaning, or to give to them a more human and vital interpretation, than formerly belonged to them: as in the definition of the Bible "as a sort of Christian memory to hold, and keep real to us, all that has taken place in our inner life;" or in the fine description of death as God taking man at his word by imposing on him the isolation of that hour: "Death says to the sinner, 'You would not obey God, you would not love your fellow-men, you lived for self, you wanted only self—THEN TAKE IT!" But these attempts leave on our mind the increased conviction that the experience of the world has outgrown the philosophy of the schools, and that he who follows the clue which Dr. Curtis puts into the hand of his reader but does not follow, the clue of a real man's

real life, will inevitably be led by it away from belief in an infallible Bible, in a series of breaks in the physical order for moral purposes, in incarnation as an episode, stupendous but still an episode, and in a propitiatory sacrifice to change the heart of God, and toward a philosophy which will make the Bible the type of a universal but always and necessarily fragmentary revelation; miracle as an extraordinary manifestation of an always manifested God; incarnation as the supreme type of man's true relation to his Father and therefore the supreme revelation of the Father to his children; and the sacrifice of Christ as an interpretation in history of what Dr. Stevens has well called an Eternal Atonement, an atonement not made by a sacrifice offered by man or for man to propitiate God, but by God and for God to save, ransom; redeem, and perfect man.

EUROPEAN DEVELOPMENT

RCHBISHOP LEIGHTON'S remark that the best knowledge of things lies in a knowledge of their causes has a special application to historical knowledge. To know what events have occurred is not enough to make experience instructive; one needs to know why they occurred. But the causes of historical events are sometimes long in coming to light: hence the writing of contemporary history in its true sequence of cause and effect is a work of peculiar difficulty even for so well informed a writer as Dr. J. Holland Rose. When luminously done, as by him, it vields peculiar satisfaction to the reader who finds in it an interpretation of events that have passed before his eyes.

The making of the more important States of Continental Europe what they are to-day is Dr. Rose's theme. In this process the motor forces were supplied by the twin spirits of Democracy and Nationalism, born in revolution and war a century before. The greatest triumph of the latter, indeed the greatest political

event of the century, was the unification of Germany, secured at the psychological moment by the war of 1870 with France. Among the causes of that momentous conflict, whose stages are here critically studied and illustrated, the most effective appear to have been the inflammatory journalists of Paris and Berlin—a sobering caution to us against the use of red ink in international discussions. As to Bismarck's responsibility, Dr. Rose absolves him. He certainly desired the war as the means to give birth to the Empire. But his claim to have fired the mine by giving to the press an "edited" version of the King's telegram is not borne out by a comparison of the two versions, and Dr. Rose. who differs here from most writers, sets it aside as "the offspring of senile vanity."

The thirty years' story of the German Empire and of the founding of the French Republic, both born in the same collision of folly with statesmanship, occupies several chapters with a luminous sketch of the prominent features of each, in which the protectionism and State Socialism of Germany possess a special interest for us. The scene then

The Development of the European Nations. By John Holland Rose. G. P. Putnam's Sons, New York.

shifts to the Eastern question, and its diplomatic, military, and political developments. How the Turk's intolerable treatment of his Christian subjects has ever found a serviceable shield in the timorous and cynical selfishness of the Christian Powers, and how this has even strengthened his throne, is clearly ex-Dr. Rose cites the highest hibited. authority for attributing to the British Cabinet the Sultan's venturing on war with Russia in 1877 rather than yield to pacific pressure on behalf of his outraged Christian subjects. Both for British and for broadly human interests Lord Beaconsfield's policy during the critical years 1875-77 appears now to have been unfortunate. The Russo-Turkish war in 1877, to whose strategic movements Dr. Rose devotes a chapter, brought the Russian army and the British fleet into menacing nearness at Constantinople, and Europe trembled on the brink of a great conflict. The Treaty of Berlin, then forced upon Russia by the European Concert, gave promise of substantial relief to the Christian subjects of the Sultan. How far the promise was fulfilled the hideous massacres in Armenia and the atrocious misgovernment of Macedonia have shown to the disgrace of Christian Europe. Deeper shame, as Dr. Rose affirms, falls upon Great Britain, who assumed, together with dominion over Cyprus, responsibility for securing justice to Christians in Turkish Asia. The chapter on "The Making of Bulgaria" shows Turkey rather than Russia to have been the

gainer in the end through the creation of the buffer States of Bulgaria and Rumania between her and the colossus of the north.

But for Russia "the outcome of the war was Nihilism." The misery inflicted on her armies by incompetence and fraud, and the exasperation of the national spirit by the humiliating Treaty of Berlin, found vengeful vent in the beginnings of that revolutionary movement which the disastrous war with Japan has brought to its frightful culmination. To this subject Dr. Rose devotes his final chapter, "Nihilism and Absolutism in Russia," pausing on the verge of the catastrophe to show the operation of the reactionary forces that delayed it, and, as we now see, intensified it.

Until the private papers of great personages and state documents now locked up shall come to light, the sources of history used by Dr. Rose can hardly be enlarged. The reader cannot fail to see in his work the hand of a careful and sympathetic student of the struggle of nations toward the realization of their ideals. Nor will any American dissent from his conviction that "it is the special glory of the nineteenth century that races, which had hitherto lain helpless and well-nigh dead rose to manhood as if by magic, and shed their blood like water in the effort to secure a free and unfettered existence both for the individual and the nation." But the effort is still short of the goal, and the twentieth century looks forward with mingled fear and hope.

Comment on Current Books

This interesting volume is partly historical, partly auto-biographical. The author, Mr. Abolitionists 4 8 1 John T. Hume, was one of the Garrisonian Abolitionists. In his boyhood he served as conductor on the "underground railroad." During the Civil War he was a leader among the Missouri radicals, and chairman of their delegation which opposed Mr. Lincoln's renomination by the Convention of 1864. Mr. Hume still entertains the dissatisfaction which the radical wing of the Unionists, East and West, felt with Mr. Lincoln's cautious attitude toward emancipation. His long life includes the early history of the great struggle for human rights, when abolitionists were accounted lawful game for mobs. names of its heroes and heroines, and the tribulations they fought through, find record in his pages. (G. P. Putnam's Sons, New York. \$1.25, net.)

This volume by Charles Gibson A mone is an informal story, with abun-French Inns dant illustration, of a pilgrimage to localities in rural France which the pilgrims selected because of their representative historical or picturesque aspects. They devoted several summers or portions of summers to excursions and visits, and not only looked at the country with the eyes, but studied its history and worked up its legends. Special attention was naturally given to the lins as the centers from which interesting excursions were made, and residence in these hostelries made it possible to acquire something of the atmosphere of the different localities. The result is a substantial volume which might well serve as a guide to travelers eager to get off the beaten tracks and to see France in its most characteristic features; and is also a very readable and interesting volume, taking one through parts of Normandy, Brittany, Touraine, sections of southern France, and ending in the Forest of Fontainebleau. Fact and fancy in the shape of observation, history, and legend are happily interwoven with personal incidents and experiences; while the illustrations are well chosen to present both the architecture and the scenery of the localities visited. (L. C. Page & Co., Boston. \$1.60, net.)

The publishers are strictly within the facts in saying of this work that from an artistic standpoint the book is a notable contribution to the literature of sport, and the authors' names are an

abundant guarantee of the accuracy and interest of the text. The volume is edited and illustrated by Louis Rhead, and contains chapters by the editor as well as by William C. Harris, Tarleton H. Bean, and others. Marine and fresh-water basses are discussed in all their varieties, and while the volume is mainly intended for the fisherman, the natural history side has not been forgotten. There are both colored and black-and-white pictures in abundance.

Among all the great composers Brahms none is more worth knowing than Johannes Brahms. This volume by Mr. J. Laurence Erb affords an admirable introduction to him. Indeed, it is useful to those who already have made acquaintance with this towering figure among modern musicians. Although it is written without any great distinction of style, it is decidedly readable. Like other volumes in this series of "The Master Musicians," it is divided into three parts, Biographical, The Man, and The Musician. The first part is characterized by straightforward narrative, which, though brief, is evidently not dependent on secondary sources; the second is characterized by anecdotes as well as by descriptions of Brahms, and is a good bit of portraiture; the third, a critical estimate of Brahms's music and his artistic ideals, is sane and fair, freely according space to Brahms's severest critics as well as to his most appreciative advocates. In the midst of the turmoil and restlessness of the present prevailing school of music and the self-consciousness of most modern composers it is refreshing to turn to this great personality whose modest wholesomeness stamped every note of his compositions, even the most dramatic, with sincerity and partly explains their serene majesty. (E. P. Dutton & Co., New York. \$1.25.)

The Cathedral Builders in England

Continent monastic buildings have largely perished, the English cathedrals of Durham, Ely, Norwich, and Winchester offer to us some of the finest Norman-Romanesque monastic fabric in Europe. These structures owe their preservation largely to the fact that in England the bishops had their seats in the monks' churches. Other Benedictine churches, later made cathedrals, such as Peterborough and Gloucester, supplement

Digitized by Google

the record. Then come cathedral churches built on the Benedictine model, as Chichester and Southwell. In the Transitional Style which followed, the birth of Gothic art stood revealed. It coincided with the foundation of the reformed monastic orders-Wells and Ripon being examples. Then came the Early English Salisbury and Lincoln. So we proceed to the Decorated Style-Exeter, for instance-characteristic of the romantic and aristocratic sentiment of the fourteenth century; then to the more practical fifteenth century, with its expansion of civil and commercial ideals; then to the stoppage of cathedral building with the Dissolution, and then to its renaissance at a later epoch, as shown in St. Paul's, for example. An orderly exposition of all this is contained in Mr. Edward S. Prior's "The Cathedral Builders of England," a good account, with interesting illustration, of English ecclesiastical architecture from 1066 to the present time. (E. P. Dutton & Co., New York. \$2, net.)

A Child's
Garden of Verses
about children or for children, bound in brown flexible leather, printed from clear type on a good page; one of the most attractive forms in which this most delightful book about children has appeared. (H. B. Turner, Boston. \$1.50.)

Florentine Palaces Ross turns out to be a guide-book. For such a purpose, however, the publishers have put forth the volume in at least one size too large for the ordinary pocket. Some of the book's thickness, too, could have been obviated by suppressing the illustration-at least by making the pictures much smaller. The palaces are arranged aphabetically and hence practically. The author describes about eighty palaces, whether public buildings or great private residences. She gives to us surprisingly scant information concerning architecture, but a great deal about the important events which happened within the buildings she describes or in connection with them. (E. P. Dutton & Co., New York. \$2, net.)

Friedrich Schiller

This adequately illustrated and tastefully bound volume by Mr. Paul Carus is an admirable memorial of the recent Schiller centenary. In addition to a biographical sketch we have two thoughtful essays by Dr. Carus on Schiller as a philosophical poet and on Schiller's poetry. Both have well-chosen selections of considerable extent, and it was a good idea to present these illustrative excerpts in both German and English.

(The Open Court Publishing Company, Chicago.)

Guide to the Lives of Christ are adapted to the demands of different classes of readers no less diversely than a business directory as compared with the catalogue of an art gallery. Professor William Bancroft Hill, who has the Chair of Biblical Literature at Vassar College, has prepared this little book as a reader's directory to the sort of work that will give him just what he wishes to find on the subject named. For this it is very serviceable to the uninformed. (Edwin S. Gorham, New York.)

In the Name of A collection of short essays on a great variety of subthe Bodleian jects by a writer who is, by nature and training, a spectator and commentator of the school though not of the genius of Charles Lamb. Mr. Augustine Birrell has the light touch, the sense of humor, the feeling for human things, and the knowledge which equip a wise observer and a witty and entertaining writer, and he has more than once shown critical gifts of high quality. This volume is more fragmentary and discursive than the earlier books from the same hand, and the papers are, on the whole, less valuable; though one or two of them, especially that on his father-in-law, the author of "London Lyrics," is not only very interesting, but valuable as a personal impression and interpretation. (Charles Scribner's Sons, New York. \$1, net.)

This is a volume of sea tales written with the accurate knowledge of the life of the sailor which characterizes all of Morgan Robertson's work. Several of the stories describe the marvelous experiences of an old salt who has descended to a berth on a scow in New York Harbor, but whose adventures lead him once more on to the high seas. Other stories narrate suppositious incidents of the Russo-Japanese war on board submarines and torpedo craft. The tales are remarkable rather for ingenuity than for any convincing quality. (Harper & Brothers, New York. \$1.25.)

Outside the Law In this book James Barnes has written a detective story with the detective left out. A gentleman of wealth has undertaken as a hobby, entirely for his own delectation, the engraving of imitations of old and valuable prints. He finds that his assistant has used the secret process, which he has taught him, to make counterfeit plates of bank notes. The plates fall into his hands, and are promptly stolen. Complications result which are intricate and mysterious enough to keep the

reader in suspense to the end. (D. Appleton & Co., New York. \$1.50.)

If religion be, as it is well The Philosophy termed here, "the great of Religion psychic uplift of the race," none but a master in psychology is competent to undertake a soundly reasoned philosophy of religion. This essential qualification Professor George Trumbull Ladd, of Yale, possesses. In the first of these two volumes he presents an instructive study, historical and psychological, of the phenomena of religion in its historical development, in man as a religious being, and in religion as a life. The data thus found for a philosophy of the facts present the problems to which the second volume is devoted: whether the religious conception of God as perfect Ethical Spirit is reconcilable with modern science and philosophy; then, as to the relations of the individual and the race to the Universe; lastly, what is it all for? what is to come of it? Fundamental to Professor Ladd's course of thought is his contention that the ideals which spring from the constitution of human nature, and are found existing throughout the history of man, are no merely subjective ideas, but are grounded in objective reality, and that religion thus stands on as firm footing as science. Were it not so, it could furnish no field for philosophy, whose concern is not with fancy but with fact. On the other hand, man himself is in a long evolutionary process of becoming. While his experience is incomplete it cannot be completely understood. The aim of philosophy is accordingly limited to a progressive strengthening of the grounds of a rational religious faith: "rationality is the ultimate test of the values of religion." Religion, says Professor Ladd, begins as a naive and crude theory of an unseen superhuman reality behind the face of nature. As man's ethical development advances his ideal of the superhuman power is progressively ethicized till the limit of rational thought is reached in the conception of the ultimate reality as an infinitely varied and active, self-conscious, ethical Life. Anthropomorphism is necessitated here by human inability to conceive of superhuman excellence except in terms of the human. The rationality of the conclusion reached through elaborately critical investigation of the various problems involved is in its giving the one explanatory principle which best satisfies the intellective, affective, and practical needs of humanity. The dictum that rationality is the test of values has regard above all to ethical values, for what is ethical is real. In the comparison of religions which sound philosophy involves, ethical values are supremely decisive. Here Christianity is shown to excel, at least in one respect, its nearest competitor, Buddhism, in its ideal of a perfected social life-"the Kingdom of God." Here, as the "path" of Buddhism does not, it opens a "way of salvation" practicable for all men. Here it best satisfies the demand of the modern world with its rising social ideal of democracy. Here also, as Professor Ladd warns us, its practice falls far behind its ideal, in closer conformity to which he sees the coming test of a standing or falling Church. The foregoing is but a meager account of a massive work, admirable both in analysis and synthesis, candid in its recognition of difficulties remaining to be solved, and modestly professing to be "at the most an effort to contribute to the better understanding and higher appreciation of the ultimate meaning and supreme value of the religious experience and religious development of man." (Charles Scribner's Sons, New York. \$7 per set, net.)

Romances of Mission Days

Miller has written a collection of gentle and prettily told stories, illustrated aptly by pictures of the missions. The intention is to California, as well as an acceptable and unambitious work of romance and historic sentiment for the general reader. (Lefavor-Tower Company, Portland, Maine. 75c.)

Two in Italy

A charming volume of Italian impressions in the form of stories by Maud Howe, the author of "Roma Beata." Whether the stories are true or not, the impressions evidently are. (Little, Brown & Co., Boston. \$2, net.)

Letters to The Outlook

WHAT IS A SKEPTIC?

In an editorial of December 16 The Outlook says: "Thomas was a skeptic. He not only rejected the fundamental article of belief, . . . that on which its whele message was to rest, but he refused to believe the prophecies of the Lord; for the Lord had more than once told his disciples that he would be crucified and would rise again the third day." This fact of Thomas's "skepticism" is taken to show that the early Church did not inquire after a man's dogmatic belief, but about his love. "Thomas," says The Ontlook, "was not excommunicated. He remained in the Church and attended its meetings," and ultimately came to believe in the divinity of our Lord.

May I dissent from this characterization of Thomas? First, he was not more "skeptical" than Peter, who thought the stories of the women were "idle tales" (Luke xxiv. 11, 12, 25) until they saw Jesus (Luke xxiv. 31, 34). Second, he did not hesitate any longer than Peter did when he had any evidence but hearsay (John xx. 24, 28). Third, when he had as much evidence as Peter, his "skepticism" left a more correct faith than others had.

To my mind Thomas seems the most desirable of models for men—young men—now. He was not willing to accept so great a truth as the resurrection of a dead friend upon any but the most convincing testimony. Was he not right? Did he not represent that class of men now who want more evidence than the "say so" of ecclesiastical authority or the traditions of religious enthusiasm, but insist on having the testimony grounded in experience? The Outlook, it seems to me, slanders itself when it calls Thomas a "skeptic" rather than a sensible, sane, serious-minded man.

ALVAH S. HOBART. Chester, Pennsylvania.

APOSTOLIC CONDITIONS OF CHURCH MEMBERSHIP

It is certainly to be presumed that The Outlook would not consciously or willingly be unfair or indulge in fallacy. But it does seem as if the brief article headed "The Skeptic and the Church" in your issue of December 16 were both unfair and fallacious.

In the first place, was St. Thomas a "skeptic" in any such sense as that in which we use the word to-day? He was doubtful of the reality of the resurrection only until he had had the same proof, ocular and tangible, which had been accorded his brethren. He

had not intrenched himself behind a carefully constructed rampart of *invincible* denial, and he yielded immediately and gladly and unreservedly to the proof as it was vouchsafed to him.

Secondly, is it not a most misleading representation of the situation to speak of the little company of the disciples during the first eight days after the resurrection as the "Apostolic Church," having conditions of membership, not excommunicating Thomas (who "shared in its work and attended its meetings") because "in the Apostolic Church not dogma but love was the bond of union "? Precisely this description or explanation of Bible incidents in terms of modern denominationalism is the cause of many of our errors, doctrinal and ecclesiastical. How can such explanation be true when the Church of the New Testament had not yet come to the birth? Who can truthfully make any assertions as to the doctrine or discipline of "the Apostolic Church," when as yet the Day of Pentecost had not come, when that Church had not been endowed with power from on high, when nothing had as yet been formulated or organized? But read the first Christian sermon on the Day of Pentecost, and it bristles with dogma, and confutes the statements of the article in question. It is impossible as it is unfair to go back of Pentecost to discover either what Christian discipleship means or what Christian doctrine is. Moreover, to treat the deity of the Saviour as of so small significance that those who worship him as Lord and God shall cordially hold ecclesiastical fellowship with those who deny his Divine Lordship, and therefore logically consider his worshipers idolaters, is to be false to the truth revealed to the vast multitudes of Christian disciples through the ages all along, since the Holy Ghost was given, because that Jesus hath been glorified, King of kings and Lord of lords.

They are not "timid souls" but loyal disciples who bend the knee and bow the heart in lowly adoration, and call upon all others to do the same. Would that every one who calls himself a Christian would indeed learn the lesson of St. Thomas, and be content with no less homage than his crying out in absolute self-surrender, "My Lord and my God."

CORTLANDT WHITEHEAD.

Pittsburg, Pennsylvania.

[The conditions of admission to the Church given by Peter at the close of the Pentecostal sermon are as follows: "Then Peter said

Digitized by Google

unto them, Repent, and be baptized every one of you in the name of Jesus Christ for the remission of sins, and ye shall receive the gift of the Holy Ghost." Repentance, baptism, and acceptance of the name of Christian were the only conditions.—The EDITORS.]

SOCIALISM IN ATHENS

A friend of mine who is interested in ethnological psychology has called my attention to the article by Mr. W. D. P. Bliss on socialism in ancient Greece. While no one will dispute the testimony there adduced, few will agree with the conclusion that socialism was a potent factor in producing so many great men. Environment cannot engender intellectual pre-eminence, though it may call into existence the conditions necessary to its development. General Grant would probably never have been heard of but for our Civil War. Would any one in the wildest flight of fancy, knowing the milieu in which Napoleon Bonaparte was born, have predicted his subsequent career? But the unsettled conditions in France, of which country he was not even a native, afforded him a field for the exercise of his talents. The same may be said of Philip of Macedon, of Alexander his son, and of many other men. Every one of the prominent Russian writers of the last century was an uncompromising opponent of the régime under which he was born. The same is true of Athens. With almost the single exception of Sophocles, every Greek thinker was out of harmony, to a greater or less extent, with the peculiar democracy of Athens, which was, in truth, no democracy at all. Socrates, the greatest and most pronounced individualist of all time, paid with his life for refusing to truckle to the populace. We know from his own words that every man who took part in the politics of his day was in perpetual danger. Aristotle, "the master of those who know," and who, by the way, was not an Athenian either, considered a leisure class essential to the production of great men in the domain of thought, and he was right. But he was mistaken as to the provenience of such a class. Under the Romans the Greeks had just as little to do as before, or even less; but, with few exceptions, they spent their time "in hearing about or telling the last new thing." The Sophists were the only class that was content with the conditions as they existed, and at least in apparent accord with them. At any rate, they sought to use them for their own personal aggrandizement. Though the social conditions at Athens] were somewhat peculiar, they were not unique. Many of the Greek city-states passed through the same development with-

out producing great men in the realm of thought. It may, in fact, be said that all society progresses in the direction of the detachment of the individual from the mass; a gradual movement from the homogeneous to the heterogeneous. Galton has briefly stated the proximate causes of Athenian decline; but he does not profess to know the remote causes that set this decay in operation. The historian can generally discover the successive stages that mark the growth or decay of nations; it is beyond human ken to fathom the causes. History is full of surprises-Japan is the latest-and it is safe to predict that it will never be otherwise so long as man is, even to a limited extent, in possession of a free will. Many of the Greek thinkers-Plato and Aristotle among thembelieved that nations rise and fall by virtue of an inscrutable law of their existence. Who shall say that they were mistaken?

Athens, Ohio. CHARLES W. SUPER.

INTERNATIONAL ARBITRATION

One hears just now much talk about the extension of the jurisdiction of the Hague Tribunal for the settlement of international disputes; and some enthusiasts even predict the speedy elimination of war through this seemingly simple expedient. There is a surprising lack of penetration in most of the current discussion. Permit me to express a few facts which are almost always overlooked.

1. Courts are always constituted to apply existing law; or perhaps, in the absence of legislation, to expound existing law into new fields. This latter is always done in a tentative and conservative manner. Where the law is determined it is their sole function to apply it, entirely disregarding its righteousness or unrighteousness, its inherent applicability or inapplicability to the circumstances. It is never their duty to substitute one law for another, however expedient or necessary such change may appear.

2. The only law which can be applied by courts is the lex loci. Courts cannot apply the law of any other place, or general nebulous law. International law has validity in courts of law only as it has been incorporated into the law of the land. The Hague Tribunal, like all other courts, must apply the lex loci unless it is to exercise other functions which are certainly not judicial.

3. The law continually tends to become antiquated. New conditions and circumstances continually require new legislation to bring the law into harmony with the times. This must be true internationally as well as nationally. Moreover, while a continually developing law is everywhere neces-

sary, courts are always and everywhere traditionally conservative. Ancient precedents, antiquated forms, mediæval usages, are the material which they use. Judicial bodies, by their very constitution, hark back to the past rather than prophetically forecast the future. Changed relations, new conditions, mean nothing to them, and can mean nothing, if they are to preserve their character as courts.

4. War is not analogous in its results to a court, and therefore cannot be superseded by a court. War does not apply existing law. It destroys one legal status and puts another in its place. It supersedes one law by another new law. It is legislative, not judicial, in character. One party in every war fights to maintain the legal status; the other always strives to supplant it by another, more in conformity with its desires or with changed conditions. All wars grow out of the dissatisfaction of one nation or people with the legal status existing in some definite place. This lex loci is brought in question by the war, and the effort is made to alter it. This may not always appear at first sight, but fundamentally it holds true. Even such minor wars as are nowadays threatened to enforce payment of debts upon Spanish-American States rest upon the dissatisfaction of the aggrieved power with the legal status prevailing in the territory of the offending nation. It is not true that there is no court to administer the law. The courts of Venezuela are open, and presumably apply Venezuelan law, the lex loci. Perhaps in cases in which foreigners are parties the decisions are not just, and the Hague court might be expected to apply the law more impartially; but unless this body is to be something else than a court it must apply existing law, and the existing law of Venezuela.

5. The substitution of the Hague Tribunal for war, by unanimous consent of all nations, unless an international legislature were also provided, would result in far more serious injustice, misery, and evil than the present system of war. Without provision for the progressive development of law to meet the changing needs of the world, the application of law by any court, however distinguished and impartial, is the merest travesty of justice. In such quarrels as that of the United States with Spain, and of Japan with Russia, the verdicts would have been given in favor of the defendants, because they, in each case, stood upon the law. England could well afford to refer her dispute with her revolting colonies to the Hague Tribunal; German unity would never have been attained; South American republics would refuse to pay their debts with impunity; and Turkey would continue forever successfully to invoke the august sanction of the law. Reverence for law may become insane apotheosis.

6. If war is ever to be abolished, it must be by the substitution of an international legislature rather than an international court. But such an international legislature implies a far greater integration of national units than we have yet attained. Racial, linguistic, religious, economic, social, as well as legal differences must be assimilated. It is because such an international legislature is for the indefinite future quite impracticable that the specious notion of a world court has gained such currency. When we have a world lawgiver, we may expect a world court, not before.

Walter J. Shepard.

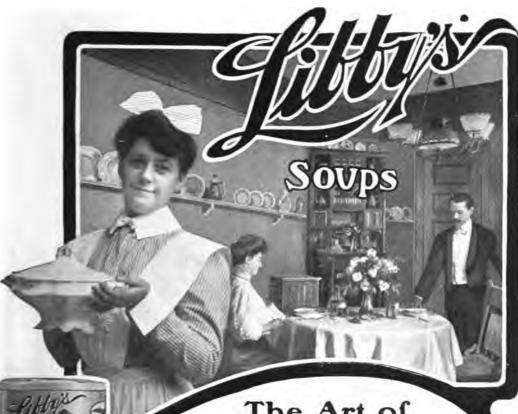

Heidelberg, Germany.

THE HIGHEST EDUCATION

In your issue of December 16 you say editorially: "The popular distinction between industrial education and higher education has no real existence. There is no higher education than that furnished by the professional schools—law, medical, theological."

May I presume to put the truth which is in this statement rather differently? The higher education is that which develops and trains the higher faculties. Technical education trains the eye, the hand, the judgment. the discerning and reasoning faculties. The higher education trains, along with these, the higher faculties, the imagination, the affections, the sympathies, the conscience, the will. This kind of education is not provided, or only incidentally provided, in the professional schools—not even in the schools of law, medicine, and theology. These schools furnish training in some single specialty, a kind of superior apprenticeship, and that not an apprenticeship to a rich and full life, but to a calling, merely or mainly. The higher education, properly considered, is not the aim of the university. It is the function rather of the college, and is attained through its so-called-and rightly called-humanistic studies. The highest education yet reached -it might be still higher-is given and gotten in the later years of our best colleges through studies, grouped so as to develop a well-rounded manhood, in literature, philosophy, art, history, economics, sociology, ethics, culminating, naturally and of logical necessity, in studies pursued in the school of Christ, in which alone the highest of all faculties, the spiritual—love, faith, power—have their full development and education.

M. H. BUCKHAM. University of Vermont, Burlington.

The Art of Making Soup

(And it is an art)

Has been mastered by the Chefs in Libby's famous kitchens. That fascinating, palate-pleasing flavor so noticeable in all the Libby Soups is obtained by using only choicest meat stock, finest prime vegetables and perfect seasoning.

The art of bringing these good, pure, wholesome foods together is what makes Libby's Soups perfect. Libby's Soups will start your dinner right—save you a big kitchen problem.

Your grocer has them. Price ten cents per can.

Our booklet, "How to Make Good Things to Eat," sent free on request. Send five 2 cent stamps for Libby's Big Atlas of the World.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly laue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DECONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the **expiration** of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

"Saved 20 Times Its Cost"

"I am writing this," says E. C. Parmelee, Highlands, N. J., "by the light of one of your Angle Lamps. In fact I would not think of using any other light. They are the lamps. Everyone who has seen mine is impressed with them. Why I have saved at least 20 times their cost in oil, burners, chimneys, and 'cuss words.'"

The Angle Lamp is not an improvement on the old style lamp but an entirely new principle of oil lighting which has made common kerosene (or coal oil) the most satisfactory of all lighting methods. Safer and more reliable than gasoline, or acetylene, yet as convenient to operate as gas or electricity.

The Angle Lamp

is lighted and extinguished like gas. May be turned high or low without odor. No smoke, no danger. Filled while lighted and without moving. Requires filling but once or twice a week. It floods a room with its beautiful, soft, mellow light, that has no equal. Write for our catalog 31 and our proposition for a

(2)

If any of the speeches The Philippine made in Congress last week by members of the opposition brought forward arguments against the bill to the effect that the proposed tariff relief would not be for the best interests of the Filipinos, or that it was not the duty of Congress to further those interests, we have failed to note the fact. The policy of the Administration was opposed or delayed, on the other hand, in two ways, both of which are far from corresponding to the description above: one consisted in gibes at the Republican party for inconsistency and timidity in its former course upon tariff matters, and in particular for its alleged unwillingness to take up seriously the question of the sugar differential; the other, in asserting that certain special interests (namely, the tobacco-growers and the beet-sugar growers) in this country would be injured by increased prosperity in the Philippines. The first need not be taken seriously as obstruction or argument; it was, in fact, the lightest of party skirmishing. Mr. Clark, of Missouri, a Democratic member, amused the House by a witty though not very dignified speech in which he favored the bill itself, minimized the effect that could be produced on the tobacco and sugar interests of the "United States proper" by what he called "the United States improper "-Hawaii, Porto Rico, and the Philippines; declared that the beet-sugar people were seven years behind the times, as they should have blocked the admission of Hawaiian sugar; and alleged that the Dingley tariff law was producing a deficit of a million dollars a day. If his speech represents the attitude of the Democrats, this is that the Philippine tariff bill is an excellent thing, but that the Republicans should have no credit for it. The real opposition is from Republicans who put local protection for their constituents'

business above considerations of National duty. On the other hand, Mr. Payne squarely answered the taunt that he had changed his attitude since the Porto Rican tariff measure was under discussion by saying simply, "I take my present position because it is right." And Mr. Hill, of Connecticut, a Representative from a tobacco-growing State, said manfully that while he was a protectionist from the crown of his head to the soles of his feet, he was a protectionist against foreign countries and not as against our own possessions. This is the true and only answer to the repeated assertions of the opponents of the Administration that the Philippines are treated now as American territory, now as a foreign country, according to the dictates of policy.

An Important
Decision

The Criminal Code of
New York makes it a

penal offense for any employer of labor to "coerce or compel any person or persons, employee or employees, laborer or mechanic, to enter into an agreement, either written or verbal, from such person, persons, employee, laborer, or mechanic, not to join or become a member of any labor organization, as a condition of such person or persons securing employment, or continuing in the employment of any such person or persons, employer or employers." The Appellate Division of the Supreme Court in the District of New York has unanimously held that this provision is unconstitutional. This is in accordance with a long line of decisions to the general effect that the Legislature can limit the private right of contract only so far as may be necessary to protect public health, public morals, or the public wel-The refusal to employ union men does not affect the public health nor the public morals, and, says the Court, it

Digitized by \$100g[@

can be said to affect the public welfare only on the ground that such a refusal will tend to incense employees and promote breaches of the peace and consequent public disorder, and—

No statute can be sustained on that theory. It is the duty of the State and the Nation to protect every citizen in the exercise of his Constitutional rights, and so long as the State and Nation last, inability or unwillingness to perform that duty may not be assigned as a justification for a law making the exercise of one's Constitutional rights a crime.

The Court recognizes the legitimacy of labor unions, but declares that it is not competent for the Legislature to force individuals against their will to become members of the labor unions as a condition of obtaining employment, nor to compel employers under penalty of fine or imprisonment to employ union men It concedes, however, though it does not affirm, that it may be constitutional for the Legislature, under its general power to alter, amend, and repeal the charters of corporations, to make it unlawful for corporations to require their employees not to be members of labor unions. In the judgment of The Outlook this decision, which may be regarded as one, if not in favor of the open shop, at least in favor of the legal right to maintain an open shop, will really inure to the benefit of the trade unions. For whatever compels them to abandon the policy of coercion, and depend on making the trade unions so valuable that every member of the trade will wish to join, will, in the long run, promote the efficiency and so the strength of those organizations.

•

An Inelastic Currency

Mr. Jacob H. Schiff, in an address last week at the Chamber of Commerce of New York City, called attention to the radical defect in our currency system, and declared that if it was not corrected the consequences might be very serious. The most important portion of this speech, which produced a decided sensation in financial circles, is found in the following sentences:

"We have witnessed," he said, "during the past sixty days, conditions in the New York money market which are nothing less than a disgrace to any civilized country. There must be a cause for such conditions. It

cannot be the condition of the country itself, for wherever you look there is prosperity—prosperity as we never had it before. The cause is in our insufficient circulating medium, or the insufficient elasticity of our circulating medium. . . . I don't like to play the rôle of Cassandra, but mark what I say. If this condition of affairs is not changed, and changed soon, we will get a panic in this country compared with which the three which have preceded it would be only child's play."

The difficulty has been compared, by a sagacious business man, to that experienced by the railways at a certain season of the year when their freight cars are insufficient for the freight traffic. Yet to have sufficient freight cars for the busy season requires many cars standing idle during the rest of the year. How to secure money enough for the busy seasons without idle money the rest of the year is the financial problem. Mr. Schiff proposes to allow the bankers to issue additional circulation beyond that now permitted, basing it upon commercial paper of unexceptionable character. To meet this difficulty Secretary Gage advocated in 1900 a system of elastic bank currency to be secured by deposits of Government bonds equal to thirty per cent. and a legal tender deposit of twenty per cent., the remaining fifty per cent. to be based upon assets and secured by a In his latest report guarantee fund. Mr. Shaw, the present Secretary, recommends permitting the National banks to issue additional Government-guaranteed circulation equal to half their bondsecured circulation, the new notes not to be secured by bonds but to be subject to a tax of five or six per cent. until redeemed; naturally, the additional circulation would not be issued until interest rates exceeded six per cent., and would be quickly retired when interest rates declined below that amount. Thus we have three plans for currency elasticity. The first two find some analogy in the German system. The Reichsbank is empowered to issue regularly a large amount of uncovered or asset currency, and in times of great demand a further elasticity is provided for by additional issues subject to a tax of five per cent, paid into the Imperial Treasury. During the crisis of 1900-1901 in Germany this system is said to have saved the nation from

disaster. Mr. Schiff's plan, on the other hand, finds a certain analogy in the history of the New York City Clearing-House during the crisis of 1893. Bank reserves had fallen below legal requirements and currency was scarce. Lacking cash for payments, the banks put out paper instead, chiefly in the form of Clearing-House loan certificates. This paper was accepted apparently without question, though it was reported that a hundred million dollars in Clearing-House certificates had been issued. That the perils of the present inelastic conditions are very real, that over-expansion of the currency tends to wildcat speculation, and inadequate currency produces an increased value in money and a consequent National inconvenience that may easily become a National distress, is apparent to all thoughtful men. It is not so easy to prescribe the remedy. Outlook believes that it would be wise to secure the appointment of a small body of experts representing different financial interests and different sections of the country to consider and propose a plan for the consideration of Congress.

The traveling public The Rights of will welcome the de-Railway Passengers cision of the Appellate Division of the Supreme Court in New York in a suit brought by a passenger against the Pullman Company. plaintiff purchased a ticket for a double lower berth in the sleeping-car from San Antonio, Texas, to Jersey City. he reached New Orleans, where he had to change cars, he was informed that there was no lower berth for him, and as he was accustomed to walk in his sleep, he believed that an upper berth would be unsafe for him and he was obliged to ride in an ordinary coach for two days and a half. He brought a suit for damages. Under the charge of the trial judge he recovered a verdict for the eight dollars which he had paid for the lower berth which had not been accorded him. The Appellate Court ordered a new trial on the ground that the plaintiff was entitled to something more than the price of his ticket, which was not an adequate compensation for the discomfort and inconvenience suffered by the plaintiff. Says the Court in this decision:

Public policy also requires that a liberal rule of damages should be accorded the plaintiff in such a case. If the damages are in such case to be limited to the cost of the ticket, not only will the traveling public be seriously inconvenienced and annoyed, but it would lead to the resale of tickets for gratuities tendered by subsequent applicants and result in the utmost confusion. The sleepingcar company has notice of every element of damages that a traveler is liable to encounter in such circumstances. For the indignity inflicted upon the passenger in the presence of other passengers by being refused the berth which he had purchased, and by being obliged to leave the sleeping-car, and for the inconvenience and annoyance which he suffers by being obliged to travel in a day coach without sleeping or washing facilities, and being obliged to change cars at early and late hours, he should be compensated. Although the decisions on this point are not fully in accord, the trend of judicial authority is that these are elements of damage for which a recovery may be had.

It is to be hoped that this decision will render the Pullman Car Company somewhat more careful than it is accustomed to be in its assignment of berths. The selling of berths or seats twice over to different passengers is not an infrequent event, and usually the complaint to the Company results in no compensation whatever to the passenger, though we believe the clerk is sometimes fined, so that the Company gets the profit of two seats sold and only one occupied plus a fine collected from one of its subordinates.

Reforms in Insurance
Management
More The publicity afforded to insurance

port, the publicity afforded to insurance methods by its investigation has already produced good results. Last week Mr. John A. McCall resigned his position as President of the New York Life Insurance Company, to be succeeded by Mr. Alexander E. Orr, the President of the New York Rapid Transit Commission. In tendering his resignation to the Board of Trustees Mr. McCall turned over to the Company his check for \$85,000 and his personal note for \$150,000, to cover the sum of \$235,000 paid to Mr. Andrew Hamilton in 1904, and not satisfactorily accounted for by him

in his recent statement. The trustees accepted Mr. McCall's payment, which will be held subject to a further audit of Mr. Hamilton's account. They had already refused to accept the deposit of \$100,000 which Mr. Hamilton desired to make for a similar purpose. Each of the "Big Three," as the New York companies which are at the head of the life insurance business in this country in point of size and prominence are called, is now under new management. affairs of both the New York and Mutual Life Insurance Companies are being investigated by committees of their trustees, and a similar investigation under the direction of its President, Mr. Paul Morton, has just been completed of the Equitable Society. In a letter to the policy-holders of the Equitable Mr. Morton reports that a rigid examination by two firms of chartered accountants shows that the assets of the Society are intact and worth over \$416,000,000; that the surplus amounts to over \$67,000,000, about seven-eighths of which is a fund for division among existing deferred dividend policies at the end of their accumulation period; that economies amounting to over \$600,000 a year have already been introduced. Mr. Morton states further that he expects to institute other economies of a radical character, and that the Society will depend upon its policy-holders that no unreasonable legislation is enacted; under no circumstances will it be a party to corrupt methods in preventing "strike" legislation. It is universally recognized that the practice on the part of agents of giving rebates to new policy-holders on their premiums is a widespread and serious evil. An agreement has just been entered into by the Equitable, Mutual, and New York Life Insurance Companies that they will not countenance the giving of rebates by their agents, and that any agent found guilty of the practice will be immediately discharged and will not be re-employed by either of the other companies. Mr. Grover Cleveland has been engaged by the companies, at a salary of \$12,000 a year, to act as referee in any disputed cases of rebating. editorial on the subject of insurance appears on another page.

The housesmiths' strike. The Printers' of which we gave some Strike account in The Outlook for December 9, has failed, as such strikes always ought to and generally do fail. A new one has now been organized for a general raise in wages from \$4.50 to \$5 a day. Such a question of wages ought to be settled by the conciliation of arbitration, not by industrial war. A far more serious strike is that of the printers. The Typographical Union is one of the strongest of the trade unions. It insists upon the closed shop—that is, none of its members are allowed to work in a printing establishment if any non-union men are working In addition there are some other regulations which employers have found irritating, if not seriously injurious to their business. Printers on the daily papers have an eight-hour day. Typographical Union is now striking for an eight-hour day in all composing-rooms. It is conceded that this shorter day will involve an increased expense to the employers. The members of the Typothetæ —that is, the employing printers—are not only resisting the demand for an eight-hour day, but are taking the occasion to demand the open shop. If we are correctly informed, the strike has not quite the extent which the daily press would indicate. It is said that in New York City there are 7,500 printers, and only about a thousand engaged in the strike, the rest being either employed by the daily press, or in shops not connected with the Typographical Union, or by establishments which have yielded to the demand of the Union. The principles of The Outlook, repeatedly affirmed, lead to a twofold judgment on this strike. Dividing the day into three equal portions, giving one-third for sleep, one-third for work, and one-third for rest, recreation, and home, is certainly a good division. Yet it is obviously not possible to apply this division equally to all establishments. Generally speaking, The Outlook believes heartily in an eighthour day, and, beginning with the first of January, this schedule has been adopted in the composing-room which is under our own control. The Outlook does not believe in the closed shop as an

essential element in trade union prin-In our judgment, the unions would gain more in enthusiasm than they would lose in members if they were all to adopt the principle, which some of the most prosperous trade unions have adopted, of trusting to the general advantage of trade unionism and public sentiment among workers to secure membership in their organizations, without attempting to coerce workingmen into trade unions by the attempt to drive them out of employment unless they are unionists. If the contest between the Typographical Union and the employers were based primarily or chiefly upon a demand for the closed shop, in comparison with the open shop, The Outlook would find itself compelled to stand in opposition to the Union on this point, even though our own establishment is not an important factor in the situation, for, with the exception of typesetting, the printing work of The Outlook is done by contract. Since, however, the chief demand is for an eight-hour day, in which The Outlook believes, and to which there are indications that substantially all employing printers will come within a short time. The Outlook has deemed it wise to adopt the eight-hour day, and postpone consideration of the question of the open shop.

❸

By a majority of five-Political Affairs in sevenths, Mr. James New York State W. Wadsworth, Jr., was last week elected Speaker of the New York Assembly. Only twenty-eight years of age, with but a year's experience in the Legislature, Mr. Wadsworth has been called upon to bear an unusually heavy political burden. Upon him, in the first place, rests much of the responsibility for the conduct of the Republican party in the State at a time when that party is resting under the shadow of discredited leadership. Whether justly or unjustly, Mr. Odell, former Governor and present Republican State Chairman, has been attacked with more bitter and contemptuous animosity than any leader has in recent years been forced to endure. With the election of Mr. Herbert Parsons, a high-minded man, as Chairman

of the Republican Committee of New York County, in place of Mr. Odell's henchman who conducted the campaign in New York City so disastrously last November, the power of the State boss was shaken. With the election now of Mr. Wadsworth as Speaker, Mr. Odell's power, for the present at least, seems shattered. Mr. Odell's warning that the State may now become Democratic has been interpreted as a threat. It is possible that he may make that threat good. The new Speaker, therefore, confronts a difficult situation. He, moreover, presides over a branch of the Legislature which has the duty of embodying in law the results of the insurance investigation. This is a task to which he brings little experience; but, as one legislator has remarked, his inexperience is better than certain varieties of experience. Governor Higgins, whose support of Mr. Wadsworth's candidacy was the signal for the final revolt against Mr. Odell's leadership, has, in a firm message to the Legislature, outlined the problems of insurance and taxation which the Legislature is called upon to solve. The whole Nation has reason for watching with interest the process by which New York State not only deals with such Nationally important problems as those of insurance, mortgage taxation, ballot reform, water supply, and the preservation of Niagara Falls, but also meets the conditions created by the dethronement of a boss capable of resentment.

(8)

The readers of Prices in Canada The Outlook are and the United States indebted for the following summary to a special correspondent of The Outlook who is now touring the Maritime Provinces with the Commission: "The transcript of the notes of the evidence and discussions before the Canadian Tariff Commission would make a much larger book than the 'Historians' History of the World.' It would constitute a veritable Domesday Book for Canada; replete with facts concerning industrial and social conditions in the Dominion in the opening years of the twentieth century. The transcript is not to be printed. Only five typewritten

copies are being made by the official shorthand writers for the use of the Commission. But were these notes to be put into book form, and made available for public reading, one surprising fact would confront the student who could give the necessary time to the work. The notes would show that, except as regards foodstuffs, all goods are cheaper to buy in the United States than in Canada. In these days of a high tariff in the United States, and of combines beyond count, this statement may seem to call for some qualification. Some explanation is in order; but there is no need for qualification. The explanation is that although the Dingley Tariff is from twenty to fifty per cent. higher than the Dominion Tariff of 1897, American manufacturers cannot or do not live up to the limit of their tariff protection as Canadian manufacturers generally do. Canada has its combines pretty much as the United States has. Seventy of them were exposed in the criminal courts at Toronto while the Tariff Commission was in that city, and these combines undoubtedly have helped the manufacturers in keeping up prices to the tariff limit. The plea of the manufacturers, however, is that prices must necessarily be higher in Canada than in the United States-combines or no combines-because the market is so very much smaller. A smaller market means a higher cost of production. Scores of Canadian manufacturers have appeared before the Commission to plead that this is the greatest industrial disadvantage under which they labor. Comparative details of American and Canadian manufacturing costs have been submitted in connection with nearly every manufacturing interest in Canada. One case will serve to illustrate the position. The manufacturers of cotton prints, who appeared before the Commission at Montreal, showed that the demand for printed cottons is almost identical in Canada and in America; but that while in New England one set of printing-machines can be run year in and year out on one line of goods, in Canada the home demand for one line is not suffi. cient to keep the machines running for a month. The manufacturers of picture

moldings and frames and of silver-plate ware, and the lithographers, presented similar cases; and among manufacturers in Canada about the only men who are not working under these disadvantages are the merchant tailors and the cigarmakers. It is clearly the immense population in the United States, the competition which still prevails in many lines of industry, and the way in which industries are distributed over the country, that serve to make it unnecessary for manufacturers, or make it impracticable for them, to push prices to the Dingley limit. Canada has not the large population; there is little or no real competition among her manufacturers, and her industrial plants are not distributed over the country as the plants are in America. In a country that is determined to have a protective tariff, that is bent at any cost on building up its industries by means of high tariff protection and bounties from the central Government and bonuses and tax exemption from the municipalities, these conditions are unfortunate—burdensomely unfortunate for the consumer; and as the evidence which has been submitted in behalf of the farmers in Ontario and Ouebec and in the Far West has shown. the burden of the cost of upbuilding these industries falls chiefly on the farm-It is now beyond question that the farmer of the Dominion, who it is conceded gains not the least advantage, direct or indirect, from the protective tariff, is being heavily mulcted on everything he buys to put the Canadian manufacturer, with his smaller manufacturing equipment, his smaller output, and smaller and more widely scattered market, on as good a footing as the manufacturer in the United States."

•

San Domingo The death in battle of General Roderiguez on Tuesday of last week is considered a serious blow to the political faction to which ex-President Morales belongs. It has been followed by the formal impeachment of Morales before the Dominican Supreme Court, and there is little doubt that on his failure to appear and put in a defense he will be pronounced guilty

Ramon Caceres, the former of treason. Vice-President, has been sworn in as President, and, unless overthrown by insurgent success in arms or by conspiracy within his own party, will hold office until the next general election, which takes place in 1907. In the skirmish or battle near Puerto Plata in which Roderiguez was killed the total loss on both sides was about seventy-five killed and perhaps double that number of wounded. A characteristic incident illustrating the instability of parties and candidacies in San Domingo was Roderiguez's declaration before the battle (which he was fighting in the name of Morales) that if victorious he should himself at once become a candidate for the Presidency. Caceres's accession is really a triumph of the old Horacista faction (named after Horacio Vasquez) as against the Imenistas, or followers of Jiminez. A patchedup truce between these factions after the overthrow of President Wos y Gil led to the selection of Morales as a compromise or provisional President under the agreement, it is said, that Jiminez should be his successor. The Horacistas have been gaining strength, and it was because he feared that they would overthrow him that Morales fled and took up arms. Where he is now is not known. There are at least half a dozen "generals," in command of small bodies of soldiers, nominally supporting the Caceres government or the Morales opposition, every one of whom would be an aspirant for the Presidency if an opportunity presented. The Dominican Consul-General in New York is reported as saving that President Caceras can give far more substantial aid to the pending treaty between the United States and San Domingo than Whether this is so or not, the Morales. greater the anarchy in San Domingo the stronger the need of just administration of its finances and the greater the danger of foreign creditor nations intervening.

280

The Russian Duma

The past week in Russia has been chiefly remarkable because of the preparations for the elections to the Duma, or Parliament, promulgated by Imperial decree last August. Of the taxpaying

classes, in St. Petersburg alone more than seventy thousand persons registered. Many members of labor and Socialist organizations, however, are not registe: ing. Their leaders have ordered them to boycott the elections on the ground that the Duma is not being chosen by direct, secret, and universal suffrage, and that it is to have no guaranteed power to frame a Constitu-The revolutionary Socialists have adopted a series of resolutions declaring against any participation in what they call "police elections," but urging Socialists to take advantage of such freedom of meeting as may be allowed them to discuss the elections and preach the doctrine of armed revolt. The Social Democrats in general do not go so far as this. They may even boycott the Duma; but they believe that a Constitution can be secured without the hor-The Moderates rors of a sevolution. and Liberals favor, of course, using the elections and the Duma as a steppingstone to genuinely representative and popular government. It is unfortunate that they are not supported by the more conservative Socialist and labor organizations. The Witte Ministry in general, and Minister of the Interior Durnovo in particular, do not seem to be shedding any tears over the refusal of the proletariat organizations to take part in the elections; indeed, encouraged by their success in mercilessly repressing the Moscow revolt, they are apparently falling into the error of which the revolutionists in many places in Russia have been guilty. Law and order should be upheld, of course, but an advantage can be pressed too far. In St. Petersburg, for instance, there have been wholesale searches for arms or evidence by the police acting under the Minister of the Interior. These have now been succeeded by an exasperating order from the prefect of police which practically gives to the dvorniks, or house porters, a free hand to search private lodgings for arms, and suspicious persons for documents, offering a premium of a ruble (about fifty cents) to them for the discovery of every revolver or bomb, and half as much for a knife. Not since Plehve's time has any Minister of the Interior countenanced such an offensive order.

☻

The political campaign in Politics in England is becoming ani-Great Britain mated. The Parliament elected in 1900 was dissolved on Monday, and a new Parliament summoned to meet on the 13th of next month, the interval between dissolution and reassembling being the shortest allowed by law. The election will be more generally contested than any which has taken place in twenty years. Twenty years ago this year the rejection of Mr. Gladstone's first Home Rule Bill for Ireland was followed by a fierce contest throughout the country. At the election held six years ago many of the nominees of the Unionists were elected without opposition; reports indicate that in the present election there will be opposing candidates in practically all the borough divisions of Great Britain. this distance indications point to a general gain on the part of the Liberals. The Conservative plan of campaign halts, and it looks now as if it were doomed to fail-The country refuses to believe that the real matter at issue is the Home Rule question; it sees clearly, apparently, that the Liberals are not only sound in policy but true to the fact in making the fight turn on the free-trade issue. Two somewhat unusual demonstrations of feeling took place last week. Disorderly political meetings are by no means uncommon in England, and political speakers are often howled down; but it does not often happen that men of the position of Mr. Balfour and Mr. Chamberlain are silenced by riotous proceedings, as these two gentlemen were at Derby and Manchester last week. The Liberals have made two very substantial gains. Duke of Devonshire, who has been an uncompromising Unionist since the last election, and who carries great weight in England, not only on account of his position, but on account of his recognized independence of mind and disinterestedness, has issued a manifesto to the Unionists' Free Trade League virtually advising free-trade Unionists to support the Liberal rather than the protectionist candidates. The Duke unceremoniously dismisses the Home Rule question, on which Mr. Balfour is insisting, as a side issue, declares that there is no indication that the opinion of the country has changed since the rejection of the last Home Rule Bill, and that it is in the last degree improbable that the Liberal Government will take the risk of introducing another measure of the same kind in the next Parliament: that, therefore, the question of free trade versus protection is the real issue in the election, and that there must be no departure from the established British policy of free trade. This manifesto is of very great importance to the Liberal party, and its effects are already noticeable in influential quarters. Not less important is the manifesto of the United Irish League, drawn up by Mr. Redmond, which declares that it is the first duty of Irish voters of Great Britain "to aid to the utmost in the discomfiture of the great coalition which has inflicted such immense injuries on their country." The Irish voters are recommended to support Labor candidates who are sound on the Home Rule question, otherwise they are urged to vote for the Liberals. This action is one of the most sagacious taken for a long time by the leaders of the Irish movement, and will do much to reinspire confidence in their ability to deal practically with a difficult situation. It seems to indicate some understanding between the Irish and the Liberal leaders. and foreshadows, probably, some measure of local self-government which the Irish are ready to accept on the principle that half a loaf is better than no bread.

The Yerkes
Gifts to New York

Charles T. Yerkes, the well-known promoter, the city of New York receives two gifts of the first magnitude. One is a great hospital, to be built in the Borough of the Bronx and to be an institution of the highest order in point of equipment and endowment. The amount of this gift has not been authoritatively announced, but it is reported that it will not be less than three millions of dollars. The other gift con-

sists of the two houses which Mr. Yerkes occupied on Fifth Avenue, with the very valuable collection of paintings, statuary, bronzes, rugs, and other objects of art which he had been collecting for the last twenty years. Mr. Yerkes is said to have taken the idea of his collection from the well-known Wallace Collection in London. It was on a visit to the Wallace galleries that he realized for the first time the great interest which the public takes in art. This collection, bequeathed to the city of London by the widow of Sir Richard Wallace, is under the control and direction of a board of trustees appointed by the Crown. After Mr. Yerkes had familiarized himself with the contents of this collection, its arrangement, its popularity, and its management, he declared that he would remember the people of the city of New York and of America in the same way. Under the provisions of his will the houses and the collection, on the death of Mrs. Yerkes, or before if she so desires, are to be maintained as a separate public museum, affiliated with the Metropolitan Museum of Art and managed by five trustees, four to be appointed by the Metropolitan Museum, the fifth being the Mayor of the city of New York. The collection which will thus become public property includes nearly one hundred works, largely of early English, Dutch, and Flemish schools, with a generous representation of the work of modern French artists. Among the most notable pictures are portraits by Van Dyck, pictures by Troyon, Corot, Daubigny, Delacroix. There are also works and Leschamps. by Rembrandt, four Turners, and characteristic pieces by Rubens, Ruysdael, Hals, Brouwer, Dow, and Ostade. The collection of rugs is said to be particularly important by reason of the artistic value which it represents. The total amount of the gift in money will probably exceed five million dollars.

A Garden City

A very interesting development of the garden city movement is being worked out at Peterton, near Cardiff, Wales. The site chosen for the experiment, which is a business one, is within five minutes' walk of the Peterton station. It is surrounded

on three sides by low hills, and readily lends itself to striking arrangement. The plan of the village is circular, with the village green in the center. This is surrounded by a row of shops. No others will be allowed anywhere else on any other part of the estate. Five wide boulevards branch off from the village green, communicating with a great outer circle to be known as Grand Avenue. The better class of houses will be located on this outer street, and will be either detached or semi-detached dwellings. Each house will have enough ground for a kitchen-garden and tenniscourts. The other avenues will be arranged in concentric circles, and the style and quality of the houses will depend upon their nearness to the village green, or outer circle, the better ones being near the latter and the less expensive ones being near the former. A limit will be placed upon the amount of land to be allowed any one individual, so that every one may be properly, and as nearly as possible equally, accommodated. Provision is to be made for recreation ground, open places, small parks, and there will be adequate provision for a religious site, and sites will be set aside for the various religious interests. Ground is to be let on ninety-nine-year leases, with a low ground rent, and the tenants are all to build their own houses. subject to the general requirements and limitations of the village. The government will, in all likelihood, be in the hands of a small committee, appointed at a town meeting. In addition to the outdoor recreation features, there will be schools, a village hall, a gymnasium, a reading-room and lecture hall. There is also to be a small village inn.

School Boards

There was one feature of the recent municipal election in Boston which has received very little attention in proportion to its importance. At the last session of the Massachusetts Legislature an act was passed whereby the existing Board of Education, consisting of twenty-four members, was abolished, and a new Board possessing the same duties, rights, and liabilities, but consisting of only five members, was created. The new Board

was made elective, contrary to the better judgment of the petitioners. However, at the municipal election of December 12 a fine Board was elected. Among the number was James J. Starrow, who was the father of the act. The Board as elected is made up of excellent men who possess the confidence of the best people of Boston. It is thoroughly representative, consisting of two Roman Catholics, two Protestants, and one Hebrew. Dr. F. V. Thompson, a postgraduate at Harvard, who has carefully investigated the organization and working of school boards in the larger cities of the country, has declared in a thesis prepared on the subject that large school boards, whether elective or appointive, are unmitigated evils. The efficiency of school systems seems to be in inverse ratio to the size of the school committee. He could find no large school board in any of the first fifteen cities of the United States that was at all successful, in the iudgment of unbiased minds. The best results are invariably accomplished by small boards. Dr. Thompson points out that there is a marked coincidence between the small boards and the date of the charter. There are but few exceptions, and these are easily accounted for, where a charter granted later than 1890 provides for anything less than a reduced board. The appointive feature seems to be the most marked tendency of the latest charters. The small board, whether appointive or elective, works There is nowhere discoverable any intelligent tendency to enlarge small The large elective board is, apparently, altogether bad in constitution, effectiveness, and generally in personnel. Every city investigated possessing such a system is seeking reform, and reform in each case is prevented only by corrupt partisan politics, or from methods equally censurable.

ക

Church Union in Canada Was taken last week toward Church union in Canada. As recorded in The Outlook of January 7, 1905, representatives of the Methodist, Presbyterian, and Congregational Churches, to the number of

one hundred and fifty, met a year ago in consultation in Toronto to promote the organic union of those Churches. After three days' deliberation they decided that there were no insuperable difficulties in the way, and committees were appointed to harmonize, if possible, the various systems of doctrine, Church polity, administration, and the status of the ministry. These committees met again in Toronto for further consultation and to report a practical basis of union. That irenical conference met, very appropriately, in the Christmas week, December 20 and 21, in a church decorated for Christmas. A common creed was formulated expressing the essentials of the systems of doctrine of the several Churches. It was found, in frank and friendly discussion, that there were fewer points of difference and more of agreement than they had thought. The sovereignty of God and the free will of man were shown to be the complements each of the other. Similarly it was found that the diverse systems of Church polity and administration and ministerial status could be harmonized to the mutual advantage of all negotiating bodies. The name of the new organization will probably be The United Church in Canada. names suggested for its courts are: General Assembly, to meet every two years, Annual Conferences, and Local District Councils or Presbyteries. The pastoral term may be of indefinite duration, but a Settlement Committee may assign pastors to their charges from year to year. The principle of lay delegation is recognized in all the Church courts. freedom of congregational action is given the several Churches, their ultimate relations being left to the legislation of the General Assembly, tentative plan of union will be submitted to the General Conference of the Methodist Church, the General Assembly of the Presbyterian Church, and the Congregational Union for further action, and will doubtless be sent by these bodies to the people, who are ultimate authority, for ratification. The Rev. Dr. Carman, General Superintendent of the Methodist Church, presided with rare ability, and three secretaries, representing the three Churches, kept the

record of this epoch-marking conference. The pressure on the resources of all the Churches in both men and money for the extension of their work in the great Northwest of Canada, so fast filling with a foreign population, was a very strong factor in promoting this union of effort to overtake the needs of the new West. Immigrants are pouring in by the thousands, and it will tax the energies of the United Church in Canada, and all of the other Christian agencies, to supply those needs.

The Strike of an Opera Chorus

Gounod's "Faust," that most popular and tuneful of a strike of an operation of the strike of the ful of operas, was sung last week at the Metropolitan Opera-House without a chorus. Operatic stars of the first magnitude were on the stage in plenty, but the host of lesser lights was absent. In some passages the opera was "cut." but in others the orchestra played its part while mute supernumeraries presented Chorus even more quietly than Bottom promised to play the part of Lion. At the close of the first act Mr. Conried, the manager, read before the audience a typewritten statement in explanation. He declared that the members of the chorus, acting under the orders of the labor union, had, without notice, deliberately repudiated the contract which they had signed with They had him as individual singers. made demands as members of a labor union to which, "as a matter of principle, of respect for art, and of respect for this art-loving public," he had refused to submit. He admitted that his objections to making concessions to the chorus were "not founded upon the nature of the demands themselves;" he simply "refused to be dictated to by the chorus as a labor union." Before the end of the week a reconciliation was effected. Each side asserted that the other side had made a concession. In this probably both sides are right. After conference with President Gompers, of the American Federation of Labor, Mr. Conried received the chorus, without formally recognizing it as a union, acceded to its demands for increased salary and better treatment, and announced publicly that the chorus had yielded to his demands.

This is a case where the dispute ought to have been settled without causing annoyance to the public.

To us, and we believe Musicians to all reasonable peoand Labor Unions ple, the demands of the chorus seem entirely justified. The members were paid fifteen dollars each a week. This is less, we understand, than is paid to members of the chorus in many musical burlesques. certainly seems in appalling contrast to the huge salaries, not infrequently a thousand dollars a night, paid to the so-called The work of the chorus singer is not only unremunerative, but is distressingly hard; long-continued rehearsals added to the performances lasting late into the night make a demand upon the nervous energy as well as the physique of the singer which is never made by a labor that does not involve the emotions as does the performance of music. Mr. Conried's defense or explanation seems to us really in the nature of a confession. It is equivalent to his saying that he will grind down the members of the chorus until they make an organized remonstrance and then he will deny them relief because their remonstrance is organized. On the other hand, this chorus, we believe, made two serious errors. In the first place, its members violated their contracts. No enemy of any organization, whether it be industrial or artistic or otherwise, can do it more serious harm than can those, even if they be its professed friends, who counsel it to break its word. Labor organizations have done themselves vast injury by repudiating contracts. The very power of collective bargaining for which they struggle is dependent upon the inviolability of the bargain which they make. The second error which this chorus made, we believe, was in allying itself with a federation of labor unions. The Outlook believes that orchestral players, chorus singers, and all other musical performers not only have the right to organize themselves, but also are likely to be benefited by organization; but they lower their own calling and injure even their economic standing by regarding themselves as laborers, even

though they class themselves as skilled laborers. In the performance of music the personal equation enters as it does not into even the skilled trades. No singer or musical performer can do his part, even though it be the humblest part, well, unless he regards himself as contributing to a work of art. Certainly no labor federation is capable of understanding the elements that enter into the production of a work of music, and therefore no labor federation ought to have the power to determine in what fashion a work of music should be performed.

Panama

Mr. Poultney Bigelow has contributed an article to the New York "Independent" describing conditions as he saw them in Panama, which has attracted wide attention. It is wholly pessimistic: from his description it would appear that in the past everything has been done wrong and nothing right, and that throughout the work has been characterized by inefficiency mingled with dishonesty. But he throws no light on the question whether things are going from bad to worse or bad to better; he gives no indication of having interviewed any of the public officials for the purpose of ascertaining what they have done or are trying to do, and intimates that he regards such inquiries as superfluous; his accusation that Secretary Taft in common with others made a superficial investigation and a whitewashing report, and exhibited a "panicky dread of disease where thousands of their fellow-men were exposing themselves," needs no other reply than Mr. Taft's past career, proved character, and public service: in brief, if there are whitewashing reports, there are also black-washing reports, and one is little better than the other.

But when all this is said, it remains true that here is a definite accusation and an individual accuser, who gives specifications, dates, and names, so that his story can be investigated, and either verified or contradicted. Previous anonymous stories are focused in this signed report. The Outlook believes that Mr. Taft's account of conditions at the Isthmus, as

given in The Outlook for December 9, is as much more reliable as it is less sensational than Mr. Bigelow's. But the country ought not to rest on beliefs of either individuals or newspapers; it should have assurance. Mr. Taft has himself invited a Congressional investigation. The President, in his special message to Congress accompanying the annual report of the Panama Canal Commission and the Panama Railroad Commission, repeats with emphasis this invitation. It is true that he characterizes as wholly without foundation the charges hitherto preferred against the work as carried on at the Isthmus:

All the work so far has been done, not only with the utmost expedition, but in the most careful and thorough manner, and what has been accomplished gives us good reason to believe that the canal will be dug in a shorter time than had been anticipated, and at an expenditure within the estimated amount.

Trom time to time various publications have been made, and from time to time in the future various similar publications doubtless will be made, purporting to give an account of jobbery, or immorality, or inefficiency, or misery, as obtaining on the Isthmus. I have carefully examined into each of these accusations which seemed worthy of attention. In every instance the accusations have proved to be without foundation in any shape or form.

But the President proves his faith in the excellence of the work by inviting Congress to investigate for itself. court," he says, "the fullest, most exhaustive, and most searching investigation of any act of theirs" (the officials engaged in the Panama work), and he promises exemplary punishment if any one shall be shown guilty of any wrong. To this invitation Congress should at once respond. It owes no more imperative duty to the country than to provide such an investigation as shall discover incompetence or dishonesty if they exist, and shall put an end to the reports of incompetent or dishonest observers if such there are.

Nor should this investigation be made merely by a committee of Congress. It is charged that the inefficiency discovered is largely due to Congressional appointments. The country has quite as much desire to know about Congress as about the War Department. It cannot be difficult to secure the appointment of some men of National reputation to go on behalf of Congress, either with a Congressional committee or independently, to make a thorough inquiry and a full report as to present conditions and immediate prospects at Panama.

Let us not be misunderstood. We believe in an Isthmian Canal built by the Government and operated by the Government. We recognize the great difficulties which the Government has to overcome in achieving this undertaking. The engineering difficulties are not insignificant. The sanitary difficulties are The difficulty of securing and greater. maintaining the necessary labor is still greater. Mr. Bigelow is certainly ill informed in his statement that "there is plenty of labor to be had for the asking." But there are other hindrances which, just because they are not patent, are more difficult to overcome. There is a corporate interest, the more effective because it is unavowed. is a conservatism which does not believe that government should go into any industrial undertaking. There is a partisanship always ready to exaggerate evils for the purpose of attacking the Administration. There are some journals and some journalists-though the "Independent " is certainly not among themthat think the best way to show a courageous independence is to criticise, if not to vilify, anything that is American. There are politicians, in Congress and out, who are only too ready to foist upon the Panama Canal any man who has rendered them a political service. And there is a spirit of impatience in the American people, who are too eager for immediate results to consider the difficulties to be overcome before the results can be secured.

These constitute excellent reasons for patience with the Government in the work it has undertaken—excellent reasons, too, for distrusting the reports which are published from time to time for the ill-concealed purpose of discouraging the American people and preventing the further prosecution of the work. But they are not reasons for suffering evils which can be corrected, nor for a failure to demand a high standard of efficiency, nor for suffering a popular ignorance as to

the work, its conditions, the hindrances it meets, and the progress it is making. The honor of the Nation is at stake in this enterprise. And therefore the Nation ought to know how that enterprise is being conducted.

The Outlook intends to contribute its share to secure this result. Several weeks ago it secured the services of a special commissioner to go to Panama and investigate conditions-Mr. John Foster Carr, author of the article on "Campaign Funds and Campaign Scandals "recently published in The Outlook, and of other carefully written articles in "The World's Work" and elsewhere. Mr. Carr is now engaged in preliminary preparations in order to make his investigation as thorough as possible. He will start the last of this month, but it will be spring or early summer before we can give our readers the result of his investigations. Neither time nor pains will be spared in making them as thorough as it is possible to make them. His object will be neither to eulogize nor to condemn, but to report. His instructions are to make that report without fear or favor. His character is a guarantee that he will make it in no And we recommend those other spirit. readers who are accustomed to trust the honesty and the intelligence of The Outlook to suspend their judgment concerning conditions on the Isthmus till this report of The Outlook's representative is laid before them.

18

Life Insurance Reform

The Insurance Investigating Committee has completed its sessions and will make its recommendations to the Legislature for changes in the insurance law as soon as its report can be prepared. It has sat for four months and taken volumes of testimony on the different phases of the life insurance business as conducted in New York State. testimony has disclosed an astounding lack, on the part of the officers of insurance companies, of a sense of trusteeship, manifesting itself in disregard of the rights and interests of policy-holders and too often in exploitation for personal gain of their property as represented by

the funds in the treasuries of the companies. Coupled with this misconception of their fiduciary capacity there has been shown to exist among insurance officials a kind of moral cowardice which has led them to expend great sums of money to influence and control legislation and taxation in the different States. Both of these conditions of mind are probably present, in some measure, in those who control other financial and commercial institutions; but nowhere else, except in savings banks, is it of such vital importance that they be eliminated.

Until the recommendations of the Committee are made public The Outlook refrains from making or discussing any definite suggestions for legislation. There is, however, one broad principle lying at the foundation of life insurance which has been almost completely lost sight of in the recent development of insurance business, and even in the recent discussions of the subject. life insurance the interests of the beneficiary should be paramount. Life insurance was originally intended, and, until the time of the late Mr. Henry B. Hyde, the founder of the Equitable Life Assurance Society, was only intended, to enable a man to provide support after his death for those dependent upon him. On this theory the best insurance company was the one that gave in return for the amount of money which the insured had expended the largest sum to the beneficiary. The invention and introduction by Mr. Hyde of "endowment" or "investment" forms of insurance obscured this principle and diverted attention from the returns which the beneficiary would receive to those which the insured might receive if he lived through the period for which his policy was written. These new forms of insurance made possible the piling up of enormous surpluses, with the almost inevitable consequence of extravagance and exploitation. endowment policies were more popular, and more of them were written; the company could pay the agent a larger commission on such a policy, and he would therefore recommend it more strongly. Everything co-operated to throw the emphasis from the "straight" life policy to the investment form of

policy. In consequence, the insurance company came to be regarded as the best which, measurably ignoring the beneficiary, promised the largest dividends to the insured.

There is without question a real and legitimate demand for endowment policies, but there is a no less real and a more important demand for "straight" life policies from those who can afford to pay only for protection, and to whom the protection is vital. This demand should receive the first consideration, while the other should not be neglected.

If the reform of the insurance law is to be anything more than a tinkering with the law, it must embody in legislation certain general principles. Of these one is most important: The man who desires protection for those dependent on him should be assured of procuring as much protection in return for his premium as is consistent with safety. Only secondary in importance is this principle: The man who wants an additional feature of investment in his policy should be assured of receiving as large a return upon his money as is consistent with safety. In order to produce these results the law should be so framed as to encourage honest, conservative, and economical management, insuring to the beneficiary and the policy-holder all the profits of the business beyond a fair and adequate compensation to officers, a reasonable return on their investment to stockholders, and an ample reserve.

The Situation Abroad

The anarchy which prevails in Russia, and the uncertainty of the outcome of events in the near future in that empire, have given rise throughout Europe to a general feeling of uneasiness. The equilibrium of the Powers has been destroyed, a realignment has not been thoroughly effected, and the various governments, like steamers in a fog, are feeling their way with a good deal of solicitude. There is, however, no probability of any widespread disturbance; the very conditions which have created a feeling of uncertainty tend to the keeping of the peace of the world. The death of the

Emperor Francis Joseph may at any moment precipitate a crisis in southwestern Europe, the outcome of which no man can foresee; but that menace has hung over the general situation for a long time past and is a danger to which Europe has become accustomed. Conditions have changed, it is true, during the past two years; for Hungary has assumed a much more definitely antagonistic position towards Austria, and the personal popularity of the Emperor has yielded somewhat to the rising tide of racial feeling. New conditions are likely to be produced also by the establishment of universal suffrage, which, while it is likely to diminish the power of the Magyars in Hungary, will certainly diminish that of the Germans in Austria, and anything which diminishes the power of the German element will turn that element more and more toward Berlin, and give a fresh impulse to Pan-Germanism.

Further occasion for alarm is the fact that Germany and France are not yet in full accord in regard to the situation in Morocco, and that, until the conference of the Powers which is to be held next week, uncertainty will exist. It is reported that the French are reinforcing their army along the northern frontier, and that Germany has met this indication of preparation for possible disturbance by an immense enlargement of the facilities for the transportation of troops towards the French frontier. Whatever mistake may have been made by M. Delcassé during the early stages of this misunderstanding has been more than made up by the tact and firmness of M. Rouvier. who has directed the policy of France towards Germany so far in a conciliatory spirit, but without the slightest sacrifice of dignity. The provocation of the French to lose their temper was apparently so definite that when the full story was laid before the Chamber of Deputies last week the party for peace at all hazards was overwhelmingly outvoted, all parties practically uniting in support of the Government policy.

It is said that King Edward VII., who has made himself one of the foremost personalities in Europe, is using all his tact and personal influence to persuade the German Emperor to take a moderate

course. France wants an open door in Morocco for all commerce and the policing of the country under French control. Germany, on the other hand, will take the position that this control ought to be international in its character. The United States will be represented at the conference by Mr. Henry White, Ambassador to Italy, and Mr. Gummere, the American Minister in Algiers. fact that an American fleet is to be in the neighborhood at the time of the meeting at Algeciras has been made the basis of some sensational reports, to which no kind of importance is to be attached. The plan which takes the fleet into the Bay of Gibraltar next week was made long before the conference was arranged to be held at that point. Our Government will keep clear of any possible complication in the matter, and will use all its influence to secure a pacific adjustment of differences.

It must be said, on the other hand, that the German Emperor, although somewhat aggressive in his tone, has for more than twenty years falsified every prediction of warlike intentions or a bellicose policy. In the present isolation of Germany it is not surprising that when he found himself left out of an arrangement which affected in a way German interests, he frankly declared that Germany must be consulted when international questions are at issue. That the Emperor is a statesman was demonstrated long ago, and his foresight has been justified by the events. As has often been pointed out in The Outlook, he saw when he ascended the throne that Germany could maintain her position only by an enormous increase of her financial resources, and he set to work to secure that increase with a precision, thoroughness, and mastery of detail which stamped him as a man of very great ability. There is every reason to believe that the statement he has so often made, that the German Empire needs and desires peace, is sincere. The desire for peace is universal, in spite of an occasional note of arrogance on the part of certain sections of German society; the need of peace is So far as can be foreseen, a evident. great war at this juncture would find Germany in an extremely perilous position, would very seriously interrupt her development, and might jeopardize the integrity of her colonial interests. The Emperor has everything to lose and very little to gain by war with France or with England.

The accession of the Liberals to power in England involves no change in the foreign policy of that country, the keynote of which is a close alliance with Japan, a very cordial understanding with France, and the best possible relations with the United States. This is a broadminded and far-seeing policy which makes for the peace of the world, and the Liberals have pledged themselves to its continuance. This is not only politic, but strictly in accordance with Liberal traditions. It would be a great step in advance if the relations of Germany and England could be put on a more friendly footing. The root of the unpopularity of the English in Germany and the dislike of the Germans by the English is very largely the sharp commercial competition which exists between the two countries, and business interests are quite as prominent in the politics of Europe as in those of the United The modern world is rapidly becoming a great open field for international commerce, and nations which are in the most acute stages of commercial rivalry must learn to live together in amity and good will as the United States and England are now living, although both are competitors in many of the same branches of trade. A good understanding between Germany and and Germany and France England would establish the peace of the world on a secure foundation. France's interest now centers in the election of a successor to President Loubet, whose term will expire on the eighteenth day of the present month, and who has positively refused re-election. His successor will be chosen at a joint session of the Senate and the Chamber of Deputies to be held at Versailles. Four candidates are being urged by different groups: M. Doumer, who is one of the most influential Deputies and who gained wide reputation as Governor-General of Tonquin; M. Fallières, the President of the Senate, who has behind him apparently the

dominating forces in the Chamber of Deputies; M. Rouvier, who is not likely to receive a large vote on the first ballot, but who would be an extremely promising candidate, with ex-Premiers Brisson and Bourgeois in the background, supported by Radical and Socialistic votes. A change in the Presidency will not involve any change in the general conduct of affairs in France, though the good sense and moderate temper of President Loubet have undoubtedly been important factors in the history of the country during the past seven years. More important, so far as any change of policy is concerned, will be the general election for members of the Chamber of Deputies to be held in the spring, when the verdict of the people on the abolition of the Concordat will be pronounced. The modified law, which provides that existing bishops and priests of the Church shall continue in the pay of the State, has taken the sting out of a measure which might otherwise have produced a sharp reaction. It is the conviction, however, of well-informed observers that the legislation which has dissolved a century-old partnership between Church and State has the support of a great majority of the French people.

There are possibilities of danger in the situation of affairs in Europe, but nothing to justify the alarmists who are always quick to predict a war involving all the Great Powers; every nation in Europe needs peace, knows that it needs peace, dreads the appalling expense of war, and shrinks from the radical internal changes which might follow even a successful war.

The Doom of Political Autocracy

There comes an hour in the movement of events when causes which have long been unobtrusively and sometimes without observation undermining decayed systems suddenly bring those systems down with a crash. Every bad system contains in itself the seeds of a reaction which it sooner or later sets in motion; tyranny in all forms breeds rebellion against itself, and though the

day of fate is sometimes long postponed, it inevitably arrives. It has arrived in Russia for a blind and stupid autocracy, deaf to innumerable voices of warning spoken for years past, and to signs of the times which all the races of the world have read; and it has come in America to the blinded and stupid bosses of political machines whom the gods have made mad in order that they may be destroyed. When a political boss is in possession of a State, a county, or a district, his power seems unshakable to the superficial observer, and the boss comes to hold the opinion that it is unshakable. As a matter of fact, any tide of public indignation may sweep away the foundations of his authority in a single day. This has happened again and again in the history of the country; for a party machine created by a boss is always and everywhere, under free governments, an artificial and temporary thing put up over night like a scaffolding for a procession, and taken down in an hour when it has served its time. have been times in the last twenty years when it has seemed as if any rebellion against the boss in any State were practically hopeless, as it has seemed in Russia, from the time of Tourguéness to the beginning of the present movement for liberation, that the autocracy could not be destroyed.

The strength of the boss in this country has been the negligence, indifference, and criminal neglect of the voting population. When the voters were aroused the boss has gone. is what has happened in many parts of the United States to-day, much as revolts are breaking out in many parts of Russia. These outbreaks may be quelled for the moment by a show of arms, but they are the forerunners of a revolution which will be like an avalanche. The day of boss rule and machine politics in America is rapidly drawing to a close. It has been the most dishonorable and uninteresting episode in our political history, to be explained, doubtless, by the historians of the future as an abdication of political functions brought about by too great absorption with personal interests. Individual opportunity in this country during the past quarter of a century has been so alluring and so unprecedented in the magnitude of the material prizes which it has offered that men have forgotten their duty to the State, and, because of what Mr. Kidd once characterized in the columns of The Outlook as "lack of civic self-sacrifice," the government of a good many States has gone into commission and has been carried on under irresponsible rulers.

The boss and machine systems are doomed, for three reasons:

They involve the denial of the right of self-government, the abandonment of political responsibilities, the surrender of public liberties. In half a dozen States, conspicuously in New York, Pennsylvania, Delaware, and Missouri, there has been no truly free government for many years past. New York has been ruled by a Hill, a Platt, an Odell, or a Murphy, with as complete indifference to public interests, popular convictions, and the desires of the voters of the State as if these irresponsible rulers held their places by divine right or by military authority. The people of New York have allowed their policies to be determined by a group of men who were sometimes not even in public life, held no official positions, were paid no salaries, clothed by no authority, elected by no exercise of the suffrage. Measures of the highest importance have been decided upon in secret conclave, pushed through the Legislature practically without discussion, under instructions to legislators who have been mere puppets responding to the strings that were pulled from behind. The business of the State has been transacted out of sight, on the back stairs, in whisperinggalleries; and the people of the State have been led like sheep, and like sheep they have paid the penalty. Greater enemies this country has never had than men like Platt, Odell, Addicks, and Ouay, who have transformed free governments into autocracies, annulled the fundamental charters of the country, and made popular government an object of satire, if not of derision, throughout the world.

The boss and machine system in politics is inevitably corrupt, Affairs

of state involving vast interests, dealing often directly with great investments and business opportunities, cannot be managed honestly unless they are managed in the open, where every one can see what is done, and unless they are settled by public discussion in which every voice can be heard and the public can understand what motives are prevailing. impressive vote given to Mr. Bryan nine years ago, like that given in New York City to Mr. Hearst two months ago, was not a vote indorsing the principles of the candidate; it was a protest against ring politics and the corruption that inevitably attends them. will of the people in different States has been thwarted for years, and the men who have organized the machinery which has annulled popular government have had corrupt dealings with organized capital and brought about an unholy combination of business and politics which has left the interests of the people of the country out of account. The perception of this fundamental treason against free institutions and popular rights is becoming more and more clear, and there have been increasing evidences of an impending revolution. When Senator Platt testified before the investigating committee in New York City a few weeks ago that he had been in the habit of receiving \$10,000 a year from the New York Life Insurance Company, he did not seem to be aware of the moral significance of that admission, for a curious blindness has fallen on the political bosses, as it has fallen on many life insurance officials. They have been overtaken by an avalanche without suspecting that they were in any danger, and many of them are still of the opinion that the wreck of their reputations is the result of a passing fury which will soon vent These gentlemen are mistaken. Some of them may survive and reconstruct and direct their shattered machines for a little while longer, but their era and the era of their kind of politics is fast drawing to a close. They are just as much violators of trusts, and have shown as complete an indifference to the interests committed to their hands, as the life insurance officials who have been driven by public indignation from their places. Every public man holds his place as a trustee on behalf of the people, and these bosses have treated their places, their authority, and their opportunities as if they were private property.

The boss and the machine have taken the very life out of our politics for twenty years. In that time everything that has been vital and interesting has been associated with the men who have fought against them; the real interest in American politics in that time has centered in men like ex-President Cleveland and Theodore Roosevelt, who have stood for the free movement of ideas in public life and for the administration of public office as a public trust and for the square deal. In a State in which it is impossible for a young man to go to the front in public affairs unless he bows the knee to a boss there cannot be any real public life, for no man of integrity and ability will accept that kind of servitude. bosses have substituted for the personal element, for the brains and daring of the statesman, the monotonous grinding of the machine. That our politics has had any interest during the last twenty years has been due to the fact that there have been great questions which the bosses could not postpone, and men whom they could not down.

The American people are now demanding three very simple things, and they will secure them: Free government—that is to say, the management of public affairs by the people; honest government—that is to say, the settlement of public questions and the carrying on of the public business in the interests of the people; an open field and a square deal—that is to say, the opportunity for all men to go to the front in public affairs without bowing the knee to bosses or compromising with machines. In a democracy there must be leaders, parties, and party organizations. But a party organization is not a machine, nor is a leader a boss. We are not looking for perfection; we are asking for a chance to breathe freely as a Nation, to get men in public life who will have some of the instincts of the statesman, and to be able to hold our heads up as Americans when we face the rest of the world.

PRESIDENT JOHNSON AND NEGRO SUFFRAGE

BY JAMES SCHOULER

Author of " A History of the United States under the Constitution," etc., etc.

ISTORIANS of the reconstruction period should make careful study of the voluminous manuscripts and papers left by President Andrew Johnson, which have lately been added to the collections of the Library of Congress, and throw a flood of light over the course of his forceful but unfortunate administration.

Except for a few important drafts or copies of his own letters, newspaper reports of his various speeches with verbal changes or corrections which he made in his own hand, and a few notable briefs or memoranda in connection with the impeachment trial, we find little here from the President himself. Johnson's private letter-books have been otherwise disposed of, and the collection now owned by the Nation consists mainly of the letters, pamphlets, and documents which came to him from all parts of the land, private and unofficial, seeking to influence his Presidential policy and expressive of sympathy or dissent regarding the momentous measures and aims of his administration. Here opinions of the people and of our leading men may be found freely expressed towards their Chief Magistrate. Resolutions of various public bodies are exhibited, from State legislatures and social or religious conventions down to ward political clubs, some of them handsomely engrossed on parchment or costly paper and adorned with ribbons. Besides important letters from public men we find pamphlets, prospectuses, newspaper cuttings, and the effusions of amateur poets and philosophers.

All such correspondence, however miscellaneous, indicates clearly the cross-currents of opinion which reached the White House daily, and it faithfully duplicates that other pressure of oral interview and conversation, contemporaneous in character and diversity of

belief, to which every ruler of our Republic must cheerfully yield his personal attention. The indications are many that President Johnson carefully considered the weightier matters of advice here tendered him, while it is certain that he submitted all to the test of his own independent judgment and did not follow the lead of any one. Whether in framing the great measures of National policy or in making National appointments, deliberation and an honest though sometimes mistaken purpose to do right are manifest on his part.

For the first few months following the terrible tragedy of April, 1865, which placed him at the head of affairs for closing hostilities, instituting schemes of reconstruction, and restoring peace to the whole country, President Johnson, aided by the Cabinet advisers who had served under Lincoln, proceeded with discretion and success, gaining strong popular support at the North. South was powerfully impressed by the magnanimity of his policy extended towards its people, and many of the late leaders sought sincerely to aid his efforts for a permanent reconciliation. But the crucial and fundamental difficulty was to determine and fix positively the status of the Southern negroes, newly freed and needing hostages from the Nation or their former masters for a new career. Upon this point Southern people of the white and ruling race had nothing to offer. 'And it was ominous that three and one-half millions of people, lately enslaved, had in that whole region of the late Confederacy no initiative of their own to take, nor even competent brethren of their race in the North to make plea or demand for their civil and political rights. Their only powerful friends were humanitarians who dwelt in free States far distant, or new white immigrants equally remote in local favor, too

many of whom hoped to manipulate an ignorant vote eventually for their own selfish and corrupt advancement. The Southern situation, as the senior Blair described it in one of his letters to the President, was that of a black nation inside of a white one.

This whole stupendous problem our white brethren who now came back to the National fold, laying down their arms and meaning to accept the actual results of the Civil War-which included the bona-fide extinction of slavery as an institution-had hoped to regulate after their own methods. Legislatures of the reconstructed States were not slow in taking up such matters of a new era as equal negro trials, equal negro testimony, the legitimatizing of slave marriages and slave offspring, and even to some extent the subject of equal civil rights. But to enfranchising, at once or presently, the colored inhabitants lately held in bondage, and admitting locally the principle of equal suffrage, regardless of race or color, white Southerners were to a man opposed, nor could the ablest arguments nor the most persuasive influence from Northern fellow-citizens convince them to the contrary.

President Johnson's personal views on this latter question, as well as the position which he desired to take as Chief Executive of the whole Nation, deserve the reader's attention. Those views he announced carefully and deliberately, under circumstances entitling them to the fullest credence, and while in the immediate exercise of his lawful powers as Chief Executive during the interval of Congress. It appears that in Massachusetts at this time, while all Republicans upheld negro civil rights and felt inclined to give an equal ballot to those emancipated, there was difference of opinion on other points. The dominant wing, under Senators Sumner and Wilson, were for imposing harsh conditions upon the vanquished foe; while a large and respectable portion inclined rather to the views of Governor Andrew, who favored a liberal amnesty and urged that State reconstruction be left to the South's natural leaders. The latter set tried to persuade President Johnson to attend Harvard's Commencement in the summer

of 1865. This effort failing, an address, drawn up by Professor Parsons, of the Harvard Law School, and signed by some 250 solid and influential citizens of Boston and vicinity, was sent to the White House. It applauded the President's general purpose, but claimed: (1) That all constitutions drawn up by those States lately in rebellion must be submitted to Congress when it met; (2) that equal negro suffrage seemed just in itself, while it certainly would be unjust to the Union to give two-fifths representation otherwise to the master race, over the three-fifths which the Constitution had conceded before slavery was abolished. Mr. George L. Stearns, a Massachusetts man of high personal standing, who seems to have had some earlier acquaintance with the President, visited Washington and the White House about October first, as the spokesman of these petitioners. He was most kindly received. President Johnson gave him a long and frank interview, and he made so favorable an impression by what he said that Mr. Stearns, upon his return home, reduced the substance of their conversation to writing, had it printed privately, and sent a proof-sheet to the President for the latter's revision, expressing his confident belief that the circulation of so authentic a statement of the President's views would do good Johnson willingly in Massachusetts. complied, and, with some verbal corrections, certified to the proof-sheet as substantially correct.1

"The States," said the President in the course of this reported interview, "are in the Union, which is one and indivisible. We must not be in too great a hurry with our reforms; it is better to let our Southern brethren reconstruct themselves in their several States than force them." He wished to give the South time to understand its new position, with slavery abolished. As to our political adversaries, "the old Democratic party finds its old position untenable and has come to us;" we ought not to consider ourselves worse off by that.

¹ Mr. Stearns's later correspondence shows that the friends he represented still adhered to negro suffrage; but President Johnson carefully preserved the correspondence and his own printed slip, as establishing his own views on that subject.

"Our United States government is a grand and lofty structure, which rests on the broad basis of popular rights. elective franchise is not a natural right, but a political one. I am not disposed on that point to interfere with the people of a State; if the people there go wrong, we have the army, and can control by legislation too. But the general government has no right to control the right of voting in the States. My position here is different from what it would be were I in Tennessee. There I would try to introduce negro suffrage gradually: (1) to those who had served in the army; (2) to those who could read and write; and perhaps (3), with a qualification, to others—say, \$200 or \$250. It will not do to let the negroes have universal suffrage now; it would breed a war of races." He further stated his disposition to have the apportionment basis for Representatives in Congress changed from that of population to that of qualified voters, North as well as South. If that were done, the States, in due course of time, without regard to color, might agree to extend the elective franchise to all who possessed certain mental, moral, or such other qualifications as might be determined by an enlightened public judgment.1

These were wise and honest words, whether comprehensive of the whole immediate issue or not. And it should be said that Andrew Johnson, in spite of all defects of temperament or character, was, among public men of his own section in that day, justly remarkable.

President Johnson received various letters from Southern statesmen in those months, expressed on the same point with frank but deferential counsel. Thus, Memminger, of South Carolina, lately Secretary of the Treasury under the Confederate Government, took the liberty of writing, September 4, "though under the ban," at considerable length. "The whole Southern country," was the purport of his letter, "accepts emancipation from slavery as the condition of the colored race, but neither the North nor the South has yet defined what is included in that emancipation. The boundaries are wide apart which mark

Stearns's printed proof: Johnson MSS.

political equality with the whites, on the one hand, and a simple recognition of personal liberty on the other." And he proceeded to argue, temperately, that there could not properly yet be negro suffrage, since the necessity was paramount of "training the inferior race." And this training, as well as the discipline and government, he submitted, belonged properly to each State.

But, regardless of practical methods for compelling Southern obedience short of military violence pushed to an extreme —for the task must be stupendous where external conviction seeks to mold local institutions elsewhere to suit itself-a tide of sentiment which mingled natural rights, in sense, with those political, gained at the North great headway. "The ballot itself will be a protection to those who exercise it, a means of education;" "they who handle a musket can surely handle a ticket;" "the negro vote of the South will be cast for loyalty to the Union and to the party which preserved the Union, and hence serve as a lasting national safeguard;"—such was the tenor of abstract argument to which Northern sentiment yielded. "The great doctrine of equal rights will prevail," wrote Medill, of the Chicago "Tribune," to President Johnson in September, 1865, warning him not to Tylerize his party nor go back on those who had elected him. "The civil war has emancipated the North from their vassalage to the Southern oligarchy, as well as the bodies of their slaves." All such communications received at the White House were carefully filed and considered. piece of advice, September 20, though from a personal stranger, unknown to fame, contained a passage so impressive that it was marked, probably by Johnson himself, with a pencil: "Your motives are good, but do not let the experiment go too far, so that in case of need we cannot retrace our steps."

Foremost among those in exalted station who cherished the ideal of a political reconstruction at the South upon the broad basis of equality of races, regardless of complexion or former social condition, was Chief Justice Chase. So eager was he to be in his own person the great arbiter of the two sections,

under such a policy, that even, as it would seem, while President Lincoln was alive, he impressed upon the destined successor his own ideas of "universal suffrage and quick reorganization." Early in May, while Johnson was deliberating upon a policy, he drafted in his own hand and sent to him an address with an earnest letter entreating the new President to copy, sign, and promulgate such a manifesto to the Southern people. This document was vigorous in expression and had even the glow of eloquence. It took ground that the Southern States sustain their just relation as such, notwithstanding an impotent secession. It called upon all loyal citizens throughout the late insurrectionary region to restore harmonious relations with the Union as speedily as possible; but to add the negro race, which had done so well and deserved so much at their hands, in their enrollment. They who had disorganized by rebellion had disqualified themselves for the work of restoration; and all reorganization should be by enrollment. A State convention should be summoned in each jurisdiction for a new constitution or constitutional amendment, expressive of new National conditions; there should be no more slavery, no subjugation. In his accompanying letter Chase besought the President to issue such an address as this and to lead on in the grand work. "Say to the people of the South, 'Organize your State governments and I will aid you in the work." Such an appeal, he felt confident, would quickly bring reconstruction throughout the South and Union gatherings in full response. As Chief Justice Chase was about to make a tour through the South, with this great purpose in view, visiting Wilmington, Charleston, and other points as far as Florida, he would be glad to hear from the President while absent. This journey he made. in fact, receiving various banquets and ovations on the way. In letters to the White House while on his route he described at length the state of Southern feeling as he marked it on his progress; but the Executive adoption failed him, and this correspondence subsided.

Charles Sumner, in a letter from Bos-

ton dated June 30, 1865, transmitted to the President the petition of three hundred "colored citizens of Georgia" (as he styled them), who prayed to be allowed to exercise the right of suffrage in the reconstruction of that State. And in aid of their petition, which he forwarded at their request, he made warm appeal to the Executive that they should not be shut out from exercising the right. Of this petition (still preserved among the President's papers), which consisted of various detached sheets, whose caption bore the imprint of the Savannah "Republican," it is noticeable that no signature was made by mark, and that while the handwriting of many of these petitioners bore obviously their own names rudely formed, the signatures of many others were in one trained hand, which either copied them out or wrote originally as by proxy. No other petition purporting to come from Southern negroes appears to have reached the President.

Sumner himself, and all others who sought to influence President Johnson's policy, admitted the latter's Constitutional discretion during the seven months and more which should precede the assembling and organizing of a new Congress. No one seems even to have suggested that the accidental Chief Magistrate should practice self-abnegation by calling an extra session in advance of the session regularly designated for Decem-Thaddeus Stevens, alone of correspondents, is seen advising the new President (and that in no respectful or conciliating tone) to waive his rightful initiative in reconstruction and wait until Congress should in course convene. From Pennsylvania he frankly expressed, by the middle of May, his personal disbelief in this Executive remodeling of States, and thought it better that the President should wait for Congress and leave reconstruction to that body. with more acrimony and peremptoriness, he warned President Johnson, July 6, that the restoration policy which the latter had now entered upon would "destroy the party and injure the country;" and again did he advise that the whole policy be left to Congress and until it convened, the Executive meanwhile

ruling the South by military officers. "No one of the Northern leaders," he wrote, "approves of your policy."

But the inevitable dissension between Northern party supporters of the Administration had been forecast while Lincoln was yet alive, and Johnson's stand and influence were for a conservative treatment and moderate terms of reunion. As though to trust him generously in the new emergency, ex-Vice-President Hamlin, Governor Morton, of Indiana, Generals Dix and Thomas, Elihu B. Wash-

burn and Lyman Trumbull, of Illinois, Reverdy Johnson of Maryland, Governor Curtin and Senator Cameron, of Pennsylvania, and Gratz Brown, of Missouri, were all prompt in assuring President Johnson of their sympathy and support. Zealously constant were Senators Dixon and Doolittle. Francis Lieber, the publicist, sent a pamphlet with friendly words of encouragement; while George Bancroft, now in scholarly retreat at New York, gave his approving counsel in various letters preserved with the rest.

GEORGIA AND THE CHAIN-GANG

BY GEORGE HERBERT CLARKE

HORTLY before midnight of Saturday, March 12, 1904, one Henry Jamison, a negro resident of the city of Macon, Georgia, was arrested on the streets while drunk and disorderly, and arraigned on that charge at the Monday session of the Recorder's Court. The additional charge was lodged against him of disorderly conduct in the city barracks. After a hearing he was sentenced, in the one case, to pay a fine of twenty-five dollars or be committed to the county chain-gang for ninety days, and in the other to pay a fine of thirty-five dollars or to work on the chain-gang for one hundred and twenty days. Jamison accepted the latter alternative in each instance, and was taken out to the gang before noon of Monday. On the 17th day of the same month he petitioned the United States Court of the Southern District of Georgia for the issuance of a writ of habeas corpus, which was duly granted. lengthy hearing before the United States Judge, the Hon. Emory Speer, resulted in the discharge of Jamison, on the ground that he had been deprived of his liberty and subjected to infamous punishment, without due process of law, contrary to the Fourteenth Amendment to the Constitution of the United States, which declares that "no State shall make or enforce any law which shall

abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws." The city of Macon, through its attorney, the Hon. Minter Wimberly, appealed this decision to the Supreme Court of the United States, which denied Judge Speer's jurisdiction in the following mandate, handed down October 16: "Per curiam. Final order reversed. Cause remanded with a direction to quash the writ and dismiss the petition." The Court's action was based on the contention that Jamison's means of redress lay, in the first instance, in the State courts, not the Federal. Upon the official receipt of the mandate, therefore, by the United States District Court,

¹ The case has moved with some rapidity since the writing of this article. Jamison was rearrested November 25, before Judge Speer had made the mandate the direction of his own court. As a result, City Attorney Wimberly, Chief of Police Connor, and Superintendent Wimbish were cited to appear before the United States Court January 2, to show cause why they should not be punished for contempt of court. On November 28 Judge W. H. Felton, of the Bibb County Superior Court, declined to discharge Jamison from custody on a writ of habeas corpus. An appeal was immediately taken to the Supreme Court of the State, and meantime, on December 2, Judge Speer granted an order temporarily releasing Jamison from the chain-gang on a new writ of habeas corpus, holding (1) that his means of obtaining reasonably early redress in the State courts were now exhausted, and (2) that his rearrest had been illegal. The Supreme Court of Georgia, on December 19, declined to hear Jamison's case argued until after his return to the gang, and finally, after two days' hearing, reserved its decision.

Jamison must shortly be returned to the chain-gang.

It is plain that this is not a merely individual case, nor even a State or sectional one, but a National issue of real importance, the crucial questions being these: Is "due process of law" an elastic phrase, construable in widely varying and mutually inconsistent ways by differing States, or is it to be interpreted as requiring a reasonable uniformity? If the latter, shall any court, in any State, be permitted to sentence a petty offender, without indictment or trial by jury, to "infamous punishment"—that is, one commensurate only with crime, not with misdemeanor? And if it persists in doing so, shall not the writ of habeas corpus invariably apply?

Jamison's counsel, Messrs. Akerman and Akerman, have thrown these questions once again into the scales of justice by suing out a writ of habeas corpus before Judge W. H. Felton, of the Superior Court of Bibb County, in the case of another negro, Rufus Pierson, who was tried summarily in the Recorder's Court on October 28 of last year for drunkenness and disorderly conduct, and sentenced to six months on the chaingang without the option of a fine. On November 3 the case was argued at length before Judge Felton, who remanded the negro to the custody of Mr. E. A. Wimbish, superintendent of the chain-Pierson's counsel have thereupon appealed on a writ of error to the Supreme Court of the State of Georgia,1 and will, if necessary, so I am informed, carry the case to the Federal Supreme Courts that a final decision may be reached on the merits of the question involved.

For several years past public attention has been repeatedly directed to the penal system of the State of Georgia, and of late months the cases cited above have made this interest acute. Penology is a various question, in point of both motive and method, and this paper cannot assume to handle the question in itself. Punitive law may be a panacea, or a desirable habit of action, or an unescapable responsibility that all regret.

"Look here, sir," says Mrs. Deland's Doctor Lavendar, "this business of the law is all very well, and necessary, I suppose, in its way, but let me tell you it's a dangerous business. You see so much of the sin of human nature that you get to thinking that human nature has got to sin. You are mistaken, sir; it has got to be decent. We are the children of God, sir." Strongly stated though this truth may be, and surely as it wins our response, yet no thoughtful citizen fails to recognize the dignity and power of the idea of law and the unreason of many old and current protests. While one does not care, for example, to contradict Bernard Shaw's epigram that "imprisonment is as irrevocable as death," yet it may be pointed out that the physical conquest of death is perhaps no more conceivable than the abolition of crime. And while it may be true that "the most anxious man in a prison is the governor," it is not less true that anxiety resting upon a sense of accountability is worth much more to society than defiance, bravado, or conscienceless indifference.

Whatever hopes may now be cherished of changes and modifications in prison management, it is plain that there has been since the days of John Howard and Elizabeth Fry—not further to extend the roll of honor-a steady improvement in the humaneness of the treatment accorded the captives of society. This is true in some measure of all countries vitally alive; it is true as affecting lunatic asylums and poorhouses, industrial homes and common jails, prisons and penitentiaries. The modern mind has been peculiarly alert to the countless words that have been written and uttered on this subject. Precisely for the reason, then, that the system long and still obtaining in the State of Georgia seems to the foreign observer in many respects an extraordinary anomaly, it has been the writer's purpose to inform himself at first hand of the facts, the results, and the probabilities.

Chain-gangs existed in Georgia for a long time prior to the passage of the Act of 1897 creating a State Prison Commission, and amended August 17, 1903; but this Act permits the hiring

¹ Pierson's case was heard before the Supreme Court of Georgia December 18, the decision being reserved.

out by the Commission to the several counties of the State of felony convicts for a period of five years, beginning April 1, 1904. Individuals, firms, and corporations are also permitted to enter bids for such convict labor, the minimum price considered being \$175 per annum for each convict. The prisoners bid on must be "short-term" men and women, i. e., those sentenced for not more than five years, and before allotment are formed into gangs or squads of not fewer than twenty-five nor more than fifty. The highest and "best" bid wins, and the law permits the same county or other bidder to secure the services of more than one squad. The non-bidding counties participate pro rata in the revenue accruing from such leasings, and these moneys are devoted to the maintenance of schools or public roads. The successful bidders are required to provide the convicts with transportation, food, medicine, clothing, and shelter, the State furnishing guards and physi-

By felony convicts the Georgia law means those who have been sentenced to a term in the penitentiary or to capital punishment. All other prisoners are known as misdemeanor convicts. counties are accustomed to work their misdemeanor convicts on the public roads in gangs more or less closely associated with the felony convicts, subject, however, to the supervision of the State Prison Commission. Not all of the 145 counties avail themselves of the opportunity the Act affords them of purchasing convict labor from the State, but twenty-nine do so, the chief being Fulton, Richmond, Floyd, Burke, and Bibb.

This last-named county, Bibb, is so clearly representative of the system that a brief but detailed study may profitably be made of the conditions it presents. Its chain-gang contains at the present writing a total of 123 convicts, divided as follows:

Felony Convicts Leased from the State.		Misdemeand Convicts.
White	2	6
Black		71
Total	46	77

The misdemeanor convicts are sentenced by the Superior Court, the City Court,

or the Recorder's Court of the city of Macon, the county seat. All three are "State courts." The first has power to try all civil and criminal cases within the jurisdiction of the county. The second has concurrent authority, save that it cannot hear felony cases, those involving titles to realty, divorce cases, cases of equitable relief, appeals from a justice court or an ordinary, or cases carried from the Recorder on a writ of certiorari. The third, or Recorder's Court, was constituted by the State Legislature in a charter granted the city of Macon in 1893, and has power "to try offenses against the laws and ordinances of the municipal government, and to punish for the violation of the same." The Recorder is given power to impose fines not to exceed five hundred dollars, and "to imprison offenders in the city barracks for the space of not more than sixty days or at labor on the public works in the county chain-gang for not more than six months."

The writer has attended sessions of all the courts named, and has observedas any spectator must at once observethat the great majority of petty and criminal cases tried are those of negroes. and that of these the majority, again, consist of offenses committed by negro against negro. Whether the dockets are swelled through personal spite, a desire for excitement, or a genuine love of justice, is, unfortunately, a question too easily answered by one familiar with the negro temperament. Certainly there is always to be found in a court-room during the progress of a trial a horde of negroes, many as witnesses, more as obviously entertained spectators. the Recorder's Court on Monday, November 20, I listened to the calling of fourteen cases, but two of which involved a white man either as offender or witness, apart from the arresting officers. Of these latter several were required to appear before the Grand Jury, then in session, so that a few cases were con-Only one man was sentenced to the chain-gang, receiving two months for drunkenness and disorderly conduct. This court tries some five thousand cases annually. Usually about thirty or thirty-five cases are tried on Monday

mornings, and of this number not more than five or six result in sentences to the chain-gang. The Recorder-Judge Custis Nottingham-informs me that such sentences are very rarely imposed for a first offense, and are scarcely ever incurred, save by incorrigible characters. It is interesting to notice, in passing, that even the poorest negroes show extraordinary ability to pay their fines, owing to the aid of loan-sharks and "societies," and that escape from actual easy, though the means be hard.

When a new recruit for the gang arrives, he is provided with two striped cotton suits in summer, woolen ones in winter, and such other clothing as may be necessary; iron manacles are riveted about his ankles and connected with chains two and a half feet long. manacles are not removed or removable save by the use of the anvil and cold chisel. The convict is then given a pick or shovel, and required to work on the public roads, in company with his fellows, every week-day from sunrise to sundown, the noon rest varying from one to two hours with the season. Guards stand by armed with rifles and shot-guns, to deter and if necessary to wound or kill escaping convicts; and at closer quarters walks the whipping boss, whose badge of office is a broad, thick strap over three feet long and tapering toward the end. This strap is not seldom employed several times daily, sometimes again not once in a month—on the average, according to the statement made me by Captain Oxley, the whipping boss, about six times a month. It is used on idlers and malingerers, and creates a sharp, burning sensation, though I am unable to learn of any instance in which it has wrought physical harm by drawing blood or depriving the punished person of consciousness. The law requires that not more than fifteen lashes shall be administered on any one occasion. As a rule, fewer are given.

Though the felony convicts and the persons sentenced by the Recorder wear the same stripes and are cumbered with the same shackles, they have not of late been worked indiscriminately in one gang, but are at present—

in Bibb County at least—kept distinct and separate, one group seldom seeing the other. This is true even of the sleeping arrangements; the camps are a considerable distance apart, though the accommodations do not differ. These include a rough bunk, with straw mattress and blankets. Neither clothes nor fetters are removed upon retiring, while, to make assurance doubly sure, a long chain is attached to each sleeper in turn, and fastened to opposite sides of the service on the chain-gang is therefore stockade. The women's quarters are somewhat more luxurious; they wear no fetters, and their control is less rigid. Their duties consist chiefly in the domestic occupations of cooking, washing, sewing, etc., and they are not usually permitted to leave the camp. The use of the pick, however, is not entirely unknown to them.

Whipping in the comparative seclusion of the camp appears to be a more serious affair than on the highway. the latter case, save in peculiarly refractory instances, no preparations are made and the punishment is soon over; but "at home" the convict is sometimes obliged to prostrate himself across an inclined support and receive several blows upon his bare flesh. If he refuses or resists, he is held in position by one or two of his mates. I am assured by guards and others that these whippings, though deliberate and at times somewhat prolonged, are in no wise harmful. Perhaps not; but while it is nowhere asserted that such punishments are inflicted for other than regulative, disciplinary purposes, it may be observed that even for *crime* the Constitution of Georgia forbids the use of whipping as a means of punishment.

Of the social life of the convicts—that is, of the negroes, who outnumber the white prisoners by about fifteen to one a word may well be spoken. I have talked with black-skinned men both on and off the chain-gang, and find it their general opinion that the life is not unhappy. I have often passed the gang on the public roads, hearing their drawling songs break out and seeing their picks descend in unison, with something of the same musical jerkiness of the grave-digger's performance in "Hamlet."

There is ample opportunity for talking and laughing together, at meals and after working hours, and even for smoking and card-playing. Those convicts who use tobacco are liberally supplied with it, and all are furnished an abundance of plain, wholesome food, such as corn bread, wheat bread, meat, vegetables, molasses, coffee, etc. To watch a hillside dotted with these incongruous figures during the dinner hour is to become more and more aware of their light-heartedness, their healthy poise, their almost total insensibility to shame or degradation, their childish recklessness of speech, their camaraderie, and, in some cases, their genuine attachment to their guards. I have seen discontented-looking free negroes on railway lines, on plantations, and in the kaolin mines, working no less hard but with apparently much less zest than their brothers on the chain-gang. Cases, indeed, are not rare of deliberately planned returns to the gang, after the novelty of liberty has worn away and its responsibilities have begun to pall. Whether the existence of this complacent frame of mind is not a graver menace to both white and black than extremely harsh and severe treatment could possibly become is a question I sometimes ask myself. Certainly the average negro's mind is not yet to him a kingdom, nor is it likely soon to become so. In the evasion of responsibility he is a pastmaster. Relieved of all doubt concerning his maintenance as a convict; assured that he will find and make many friends on the gang, and that upon the expiration of his sentence, which may be shortened by good behavior, he will be sent home newly clothed, and welcomed by his kith and kin as a hero back from the wars, if but on furlough; and even childishly proud of his public conspicuousness and of the very interesting episodes that he may see and share in as a member of this perpetual road-mending club: he learns to look upon the chain-gang with something of institutional loyalty, and to preserve inviolate its unwritten traditions. It is not so with the whites, who prefer and are permitted to work, eat, and sleep apart, and whose faces as a rule look conscious and sorrowful enough.

But why—the reader is asking—why cannot Georgia get along with a system less anachronistic and indefensible? Are stripes good for petty offenders? Are shackles necessary? Are armed guards desirable? Are these vigorous whippings in harmony with the modern spirit? We don't flog men nowadays in our penitentiaries or on board our warships. We don't know that quick recourse to the rough-and-tumble argument is a sure sign of gentlemanhood. dislike any exhibition whatever of physical violence for violence' sake, and particularly when we see that the relation is one, not of equal antagonists, but of painer and pained. We may tolerate and even defend the infliction of death as the penalty with which the law must visit some crimes, but even then we desire and urge that the death be quick and certain. Whipping does not seem to us a sure deterrent; it can hardly be called a manly art, nor a rational method; it is in its essence akin to the bite of the brute. Must men "reel back into the beast"? How many of your captives are, in any respect, improved or reclaimed? Why are they taught neither profitable trades nor individual self-respect? And why, too, must they be forced not only to wear the uniform of shame and to knit their brows under the stinging blow, but also to work day after day in the open, before the public gaze—a gaze indifferent, curious, or even contemptuous or hostile? There is, it would seem, something "Siberian" about this whole business.

The Georgians, like most Southerners, are kindly, hospitable, generous people, Anglo-Saxons of the old stock, conservative of their traditions, loyal in social and business relations, lovers of fair play, honorable men and women. Personally, after several years' association with them, I have come to regard their character as almost passionately idealistic. But it is doing them no discredit to say that they, again like most Southerners, have a "blind spot" that often prevents clear vision of the negro and the negro problem. For this whole matter is, as many of their best citizens freely admit, a by-product, a side issue of that eternal question, and the chain-

gang may fairly be described as Georgia's answer to the question's criminal side. I do not wish to be understood as positing more intelligence and sympathy in this regard of other sections, or, for that matter, of other countries. None of us has perfect sight, and perhaps no other people try so hard as do our Southern friends to see well and so to act well. But it is a very delicate and difficult thing for men and women with the traditions of slavery in their family heritage, and with the necessity forced upon them of practical contact with these black millions every day of their lives—the children with their nurses, the employers with their laborers, the mistresses with their cooks and butlers, the merchants with their customers, patrons with dependents, never, in the fine meaning, friends with friends—it is a very delicate and difficult thing for these white masters of the situation to understand and compassionate the peasantry—nay, the serfs -that dwell about them through a lifetime. Now, the average Southerner of station does not admit or believe this. He feels that his good-natured generosity and even at times his easy familiarity towards a tried negro retainer is proof sufficient of his understanding and sympathy. But is it? To me one of the most appalling considerations of this entire situation is, not the unwillingness, but the sheer inability, of whites and blacks to understand each other. "Between us and you there is a great gulf fixed, that they that would pass from hence to you may not be able, and that none may cross over from thence to us."

Rightly enough, the South feels that the negro population is virtually supported by the whites, and that, entirely apart from the question of color, the black man shows many racial characteristics that require to be met with firmness, directness, and even severity. In an economic sense, the negro and the South may be likened to the old man of the sea fixed unshakably upon Sindbad's back-with this difference, that the modern Sindbad is not seeking very hard to rid himself of his burden. It is true that John Temple Graves, a well-known Southern publicist, has lately advocated deportation, but the idea receives no

serious consideration, first, because it is generally deemed impossible; second, because the South is growing stronger and richer, in part despite of, in part by virtue of, her very burden. If he is a parasite, yet he may be made to serve a useful purpose. His labor is cheap, and, in the cotton-fields at least, peculiarly unreplaceable. It is, in a sense, true that the South does not want the negro, but it is also true that she does want and is determined to keep him. She wants his labor but not his vote, his presence but not his society. She looks upon him as not merely a black but an unwhite man, incompetent to become white in either body or mind, whose place in the evolutionary scheme is many stages behind that of his superiors, and whose status involves and requires, therefore, a constant social discrimination that has come to be almost an obsession by this time upon whites and blacks alike.

Accordingly, the questions our reader has been asking himself and us may be answered by others on the part of the Georgian. Can'we afford, in any sense, to maintain a large criminal population in which negroes preponderate greatly in the comparative comfort and idleness of prison and penitentiary life? Would not that criminal population increase with alarming rapidity? How are we to handle the vicious negro so as not to punish him merely, but to make him pay us a just indemnity for his crime, to make him feel our strong disapproval of his ways, to frighten him—for we cannot reach him otherwise—out of his evil habits into decency and decorum? To confine him—for he has no real vitality is to doom him to disease and death. To reform his character is an almost hopeless task. We do not say that we have discovered the ideal method even for our own local situation, but we do declare that the chain-gang system is the best means we have yet been able to devise of using the negro criminal to the economic benefit at least of both himself and society. We do not wish to treat him cruelly, nor do we feel that we are doing so. But the negro is a negro. He is not of us nor tending toward us. We must deal with him as he is.

On the other side of the great gulf

there are natural remonstrances against this point of view, some violent and reckless, some quieter and more intelligent. A few negroes show sulkiness at what they feel is oppression; many others seem to display a cheerful carelessness. Most of them, however, have a brisk realization of the meaning of the chaingang. The unrest of all has, of course, been increased by the developments of the past few months. Some show this by fiercely resisting arrest; others by the more rational behavior of inquiry and comment concerning their rights as now called into question.

The decision of the Supreme Court in the Jamison appeal cites several equivalents in matters of jurisdiction. arguments of both counsel urged upon the Court's attention also a number of cases touching the root question of law presented in this article. Probably the most important of these is that of Joseph Hurtado against the State of California. Hurtado was tried in the State Court. May, 1882, without indictment but simply by information, as authorized by the Constitution of California, for the crime of murder, and was convicted and sentenced to death. Both the State and Federal Supreme Courts sustained the finding and sentence, the highest tribunal holding that "the words 'due process of law 'in the Fourteenth Amendment to the Constitution do not necessarily require an indictment by a grand jury in a prosecution by a State for murder." and that "the Fourteenth Amendment does not profess to secure to all persons in the United States the benefit of the same laws and the same remedies.

. . . Each State prescribes its own modes of judicial proceedings." "It follows." ran the opinion, "that any legal proceeding, enforced by public authority, whether sanctioned by age and custom or newly devised, in the discretion of the legislative power, in furtherance of the general public good, which regards and preserves these principles of liberty and justice. must be held to be due process of law." Yet, while the foregoing was conceded, the Court declared that "it is not to be supposed that these legislative powers are absolute and despotic, and that the amendment prescribing due process of law is too vague and indefinite to operate as a practical restraint. It is not every act, legislative in form, that is law. Law is something more than mere will exerted as an act of power. It must not be a special rule for a particular person or a particular case, but, in the language of Mr. Webster, in his famous definition, 'it is the general law, the law which hears before it condemns, which proceeds upon inquiry, and renders judgment after trial, so that every citizen shall hold his life, liberty, property, and. immunities under the protection of the general rules which govern society."

Whatever be the outcome of the long legal struggle—and many thousands of minds are following every phase of that struggle with intense interest—there can be little doubt that not only Georgia and the South, but all parts of the Nation, will be benefited by the airing, and, we must hope, the settling, of a question which in one aspect or another—the present perhaps the most vexed—has troubled the American conscience and judgment for many decades.

A QUARTER-CENTURY OF CHRISTIAN ENDEAVOR

BY FRANCIS E. CLARK

O compress within the limits of a magazine article the story of a religious movement that has found its way into every land, that numbers its organizations by tens of thousands and its adherents by millions, and that has gathered about itself many subsidiary movements, is not an easy task; but the approaching twenty-fifth anniversary of the formation of the first Society of Christian Endeavor makes appropriate an attempt to write such a

From one standpoint, however, the task is easy, for there are no dusty archives to search, no intricate and doubtful points of origin to settle, and no disputed articles of creed or principle

to decide.

The whole life of the movement is contained between the little span of years indicated by the hyphen between the dates February 2, 1881–February 2, 1906, and does not cover half the years of many of us who can scarcely yet believe that we are not young men.

Here are a few facts which make these dates significant:

February 2, 1881.—One society with forty members.

February 2, 1906.—Over sixty-seven thousand societies, with nearly four millions of members.

February 2, 1881.—One nation and one language represented in the Society.

February 2, 1906.—Over fifty nations or large colonial dependencies and eighty languages represented.

February 2, 1881.—The only literature a draft copy of the constitution.

February 2, 1906.—Forty weekly or monthly publications in fifteen different languages exclusively devoted to the Society, weekly or monthly Christian Endeavor departments in several thousand papers and magazines, and abundant other literature in most of the chief languages of the world.

February 2, 1881.—No National, State, or local Christian Endeavor unions.

February 2, 1906.—National unions in the United States, Canada, Australia, Great Britain, France, Spain, Italy, Germany, Sweden, Switzerland, Finland, Bulgaria, Hungary, Bohemia, India, China, Japan, Brazil, Mexico, and South Africa (both for the Dutch and English), and more than three thousand State and local unions, with regular meetings held in almost all parts of the world.

February 2, 1881.—One denomination rep-resented.

February 2, 1906.—One hundred denominations represented.1

This summary makes plain, as nothing else could, the timeliness and providential character of the movement.

No genius or combination of geniuses could, in twenty-five years, have introduced such a movement into every land; and, as a matter of fact, geniuses have been conspicuous by their absence from the Society and its work. Very plain and commonplace men and women have, for the most part, managed its local and National affairs.

Its founder was one of the youngest and humblest pastors in the State of Maine, and its charter members were average boys and girls such as can be found in any New England church. The pastor was feeling about, in his youth and inexperience, for some way of training these boys and girls for Christian service, if haply he might find it. He tried many experiments, ran up many blind alleys, knocked at many closed doors; made experiments along literary, musical, and debating society lines; did not despise the seductive ice-cream festival or the succulent oyster as a means of interesting the youth in things religious; but at last made the discovery that nothing but religion really appealed to the religious nature of young people; that a prayer-meeting could be made more interesting than a debating society, and that what young men and women

Digitized by GOOGLE

¹ Whenever, in the above enumeration, the writer has had to deal in round numbers, he has made a most conservative estimate, to keep the numbers given considerably below the actual figures, which in many cases are growing so rapidly that exact accuracy is impossi-

really desired, though they did not always know it themselves, was to do something for the Church rather than to have the Church do everything for them.

As soon as he discovered for himself this old truth, which doubtless every wise man had discovered before him, he set to work on new lines, made the prayermeeting, and not the pink tea, the central feature of the Society, and service, not entertainment, its watchword.

On these lines the first constitution of the new Society was framed. There should be a prayer-meeting every week, and every one should take part in it. There should be work enough for all, and "to every man his work," definitely and distinctly marked out; and every month each committee or section of the Society must report in writing what its members had actually tried to do for the Church in the name of Christ.

Entertainment had its place in the new Society, but it was given a distinctly subordinate and secondary place, and even this the young people were to furnish for themselves, through their social and hiterary committees, and not lay an additional burden for their amusement on their overloaded pastor and elders.

Immediately a new order of things developed in that church. The young people's prayer-meeting, which, like most throughout the world at that time, was a poor, thin, dead-and-alive affair, carried on by two or three elderly young men who could "speak in meeting," became popular, interesting, often crowded and full of spiritual power; the committees brought in other young people, interested them in the church, improved the singing, beautified the pulpit with flowers, collected and raised money for missions, aroused a new interest in temperance and allied virtues.

A new day had dawned for the young people of that church, and, as it proved, for millions more in all parts of the world; for in eight months more the second Society of Christian Endeavor was formed, and soon after the third, and then they began to multiply faster than they could be recorded, and often in most unexpected places.

The desire for a larger and more fruitful work among young people was

felt everywhere. Pastors and people were think ng and talking and praying about this perennial subject—"How shall we attract and hold our young people?" The subject was in solution, as it were, the world over; and the experiment, at Williston Church, of February 2, 1881, simply gave it shape.

There were, doubtless, Christian Endeavor societies before the Christian Endeavor movement—societies with the same purpose and with some of the same methods, called by different names, and answering local needs—but they soon perished, either because they were not universal enough in their scope, or because the times were not ripe.

One of the most interesting of these pre-Christian Endeavor societies was originated by none other than the distinguished Cotton Mather; and the little book in which he tells about it was discovered years after the modern movement had grown strong. Here is its title-page:

Religious Societies.

BOSTON:

Printed by S. KNEELAND, for JOHN
PHILLIPS, and Sold at his Shop
over against the South-side of the
Town House. 1 7 2 4.

There are some interesting family likenesses between these societies of 1724 and 1881. In both great stress was put upon the weekly meeting, though in the earlier society the proceedings could hardly have been as varied and lively as in a modern Christian Endeavor meeting, for it was ordered that "there be two hours at a time set apart, and let there be two prayers made by members of the society in their turns, between which let a sermon be repeated, and there should be the singing of a psalm annexed."

Other features, too, remind us of the modern movement. For instance, the monthly roll-call meeting of the present-day society, by which it is kept free from inactive members, who are dropped if they fail to respond at three consecutive monthly meetings, seems to have been foreshadowed by an article in Cotton Mather's manual, which provides:

Let the List be once a Quarter called over; and then, if It be observed, that any of the Society have much absented themselves, Let there be some sent unto them to inquire the Reason of their Absence; and if no Reason be given, but such as intimates an Apostacy from good Beginnings, Let them upon obstinacy, after loving and faithful Admonitions, be Obliterated.

The italics and the capitals are Cotton Mather's, who doubtless meant that the names and not the unfaithful members themselves were to be "obliterated" from the society rolls, as is to-day done in the modern young people's organization when the rules are lived up to.

The most fruitful book of recent times relating to Christian Nurture is doubtless Bushnell's great little volume with that title. It turned the thought of the modern Christian world to this subject, and compelled the Church to acknowledge that there must be growth from within as well as conquest from without if she was to hold her rightful possessions as well as extend her boundaries.

The writer acknowledges with profound gratitude his debt to this book, which he read with eager interest, and whose great thought of winning and holding the youth for the Church he sought to embody in the first Society of Christian Endeavor.

Though the Christian Endeavor So-

ciety apparently found such ready acceptance and grew with such rapidity, it must not be supposed that its sails were always filled with the favoring gales. In fact, in some quarters it to-day receives far "more kicks than ha'pence," though active opposition has largely ceased.

Some one has said that every great movement that wins acceptance must pass through three stages: the "poohpooh" stage, the "bow-wow" stage, and the "hear-hear" stage. At first the public sneers at it, next it growls at it, and lastly it applauds it.

The Christian Endeavor Society has passed through all these periods of disapprobation and approbation in almost every land, and even to-day has not got beyond the "bow-wow" period in some ministerial assemblies.

Its very earliest days, to be sure, were so small and inconspicuous that they excited no interest and consequently no denominational envy or opposition. The Portland local papers did not chronicle the birth of the new society nor record any of its doings for many months, and it was half a year before any religious newspaper (first "The Congregationalist," and soon after "The Christian Union" and the "Sunday School Times") gave a column to the working of the new society.

This was as it should be, for it gave the pastor and young people time to try the temper of the new blade before its virtues were exploited. They did not feel in any way that they were on show or on trial, and did not dream for a moment that what they were doing would be of interest to anybody else in the They simply all did the best they could in their own little sphere and for their own church, attending the meetings and taking part in them, as they had promised, answering to their names with a word of purpose or high resolve at the monthly consecration meeting, doing their share on the various committees without a thought that there would ever be another Christian Endeavor Society, or that any one would care to know about the first one.

But when the societies began to multiply, and the inevitable union meetings followed, and even National conventions began to excite attention, then the cooing voice of the turtle was no longer always heard in the land, but frequently the sharp treble of sarcasm or the deep bass of more violent opposition against the new movement which the Church had upon her hands almost before she knew it

The most common accusation was that the Society would sap the strength of the church by segregating the young people; the critics apparently forgetting that in most families the young people have interests, pleasures, and duties of their own, which are in no wise antagonistic to the interests of their parents or the family as a whole.

The Society in those early days was frequently compared to the bumptious young man who, when he was admitted to his father's firm, hung out the shingle,

JOHN SMITH & FATHER

And one well-known Doctor of Divinity assured the writer, after an exposition of the principles of the Society had been given, that he had no objection to any callow and vealy young folks forming what they called a society. They could have a "Red-Headed Society," or an "Anti-Swallow-Tail Society," and for his part he presumed they would do as much good as this so-called Christian Endeavor Society.

Another very common objection in those early days was that it would promote a forced, precocious, hot-house religion, that the active members would become so fond of hearing their own voices in meeting that they would go about seeking whom they might exhort in ungrammatical platitudes.

Again the critics forgot that the object of the new prayer-meeting was not to develop a host of embryonic orators (that would have been a calamity indeed), but to put a premium upon outspoken, unabashed allegiance to Christ and his Church, and that a simple appropriate verse of Scripture or other quotation brought to the meeting fulfilled all the requirements of the constitution.

But this fact was difficult to impress upon some minds. The writer remembers laboring for some minutes to make this plain to a distinguished clergyman of the Church of England who had requested an interview on the subject. When he had finished, and succeeded, as he fondly hoped, in making his point, the distinguished clergyman merely remarked, with that exasperating brutal obtuseness which some Englishmen assume:

"This society of yours must make no end of prigs, don't cher know."

Sometimes, of course, the immaturity of the young people, but rarely their headiness, got them into trouble with their elders, as in the Australian society of Juniors who had the habit of placing on the minister's table in the vestry a little bouquet of flowers and a Scripture text as he was about to go into the pulpit. It so happened that their pastor was unsympathetic with the Junior society. and his estrangement was still further increased when he found one Sunday morning, lying beside the little bouquet, the unfortunate text, "Ye are of your father the devil;" whereupon he took the bouquet and the text and in high dudgeon threw them both out of the window.

The children, who were left too much to their own devices by their superintendent, had meant no harm, but, supposing that any verse they found between the covers of the sacred book was good, especially for a minister, had opened the Bible and written down the first one on which their eyes rested—an unhappy choice, truly, but still a due sense of humor would have prevented the good man from flying into a rage. This would have also mollified the bitterness of many another critic of the Christian Endeavor Society.

By far the most determined and effective opposition to the Society, however, has come from strict sectarians who have seen in its rapid growth a menace to denominational fences which had been built so high and guarded with so much jealousy.

And from their standpoint the denominationalists were entirely logical in their opposition, for though the Society has always inculcated the utmost loyalty to the local church and denomination, it also encourages and promotes the widest brotherhood, both internationally and

interdenominationally, and has brought the young people of the different sects together as never before since there were sects to bring together.

But these official brethren of the strictest sects could not, or would not, see the difference between "inter" and "un," inter-denominational and un-denominational, and went to work vigorously, openly, and secretly to block the wheels of the Christian Endeavor movement.

In thousands of cases, chiefly in one denomination, existing Christian Endeavor Societies were disbanded, often against the earnest wish and protest of the young people; in other churches young people were forbidden to join the movement when about to start a society; rival societies with the same principles and methods, but with different names and a slightly different nomenclature, were started, and ardently pushed by denominational influence and money.

Especially in missionary fields has this denominational pressure been hard to explain, where groups of young native Christians have been forced to give up their Christian Endeavor name and organization, which they had come to understand and love, and to adopt a purely denominational name, meaningless to them, which only resulted in separating them, in a measure, from the native Christians of a neighboring mission.

At first it seemed, when the denominational cyclone struck the Christian Endeavor craft, as though she would founder on her very first voyage. But she soon righted, broad-minded men in every Church rallied to her help, her sails filled again, and it was seen that the denominational gust was but temporary and local.

Take it the world over, the great divisions of the non-liturgical Protestant Churches are about equally represented in the Society. The Presbyterians are perhaps the most numerous, certainly in the United States, though the Disciples of Christ and the Congregationalists are close seconds. In Great Britain the Baptists and Methodists lead, while in Australia the United Methodist Church has adopted the Christian Endeavor Society as part of the official church machinery, to be found in

every one of their churches. In Episcopal churches the movement is beginning to 'grow; the Church of England Christian Endeavor Union is now a vigorous and aggressive organization.

In any event, whether Christian Endeavor is preached by name or not, its principles have been adopted and propagated by the denominational societies. In this we "rejoice, yea, and will rejoice." Moreover, their relations, which were at first very considerably strained, are becoming more and more brotherly toward Christian Endeavor, and several of them have become wholly amalgamated with the parent society by adopting its name, either alone or in connection with their denominational name.

No account, however brief, of this movement should omit mention of the remarkable series of conventions which have marked it almost from the beginning. The first Society was scarcely a year and a half old when it called its few friends and neighboring societies together, saying, "Rejoice with me."

This first little convention, when there were scarcely half a dozen known societies in all the world, was typical and prophetic. It was enthusiastic, eager, joyful, optimistic. It was full of song as well as prayer. The young people themselves had part in it. They and their leaders looked forward to larger and ever larger things. They felt the stirring of the pulse of a great movement, though they could hardly define it. new kind of convention had been born, as well as a new prayer-meeting-and this, not of the will of man or of the wisdom of man, but of the power of God.

The long series since at Saratoga, New York, Boston, San Francisco, London, Berlin, Baltimore, Ningpo, Bombay, Tokyo, Madrid, and Durban, to mention but a few, have fulfilled in a wonderful way the promise of that first inconspicuous convention in Williston Church.

The great number of eager and earnest youth, the pick of the churches, who have at these times come together has of itself been impressive and inspiring. At the convention in Boston no less than 56,425 delegates were actually registered. The city gave itself up for

a week to their entertainment. Public and private buildings and city parks, and all railway stations within a radius of twenty miles, were decorated with welcoming banners. Three simultaneous meetings, aggregating nearly 30,000, were held every day, besides many smaller gatherings, and, in the denominational rallies, more young Baptists, Presbyterians, and Congregationalists assembled in each tent and hall, it is said, than had ever before come together.

In San Francisco, a few years later, the same scenes were repeated. More than twenty-five thousand people crossed the mountains from the East on special trains. The leading dailies for a week agreed to omit all details of crime and horror, and give themselves to religion and the convention.

The latest convention, held in Baltimore last summer, was in many respects the most significant and enthusiastic of all.

Nor is this interest confined to volatile young America. Conventions in Great Britain, Australia, Germany, China, and India have been quite as remarkable and full of enthusiasm.

The writer has seen the great Albert Hall in London on more than one occasion, as well as the Metropolitan Tabernacle and City Temple, the splendid City Halls of Melbourne and Sydney and Adelaide, and the largest churches which could be obtained in Kobe and Foochow and Calcutta and Madura and Honolulu and many other cities, thronged with eager crowds of young people at such conventions.

There is something contagious and fascinating about their enthusiasm, and the magnificent volume of voice in the music; it all seems to be a foretaste and promise of the time when "all nations and kindreds and peoples and tongues" shall stand before the throne and before the Lamb," crying with a loud voice and saying, "Salvation to our God which sitteth upon the throne, and to the Lamb."

These conventions are, indeed, symbols of Christian fellowship personified, and herein perhaps lies their chief charm.

The late Joseph Parker voiced this

idea in his own picturesque way at the World's Christian Endeavor Convention in London in 1900. On the same platform in the Alexandra Palace were the Bishop of London, Hugh Price Hughes, Dr. Greenough, representing the Baptists, and Dr. Monroe Gibson, the Presbyterians; while Dr. Floyd Tomkins, Dr. Maltbie Babcock, and other wellknown Americans added distinction to the platform.

Each speaker was supposed to represent his own denomination, and Dr. Parker was naturally expected to speak for Congregationalism.

It was a frightfully hot day; the sun beat down with relentless force upon the great glass roof. Dr. Parker perspired at every pore, and the water seemed to drip from every individual hair of his shaggy locks. In his thunderous tones he remarked, after a few preliminary words, "Mr. Chairman, I wouldn't be wet through for any ism in the world, but I will sweat anywhere for the cause of fellowship and brotherhood as represented in this splendid assembly!"

The tremendous applause that followed this sentence showed that the audience, too, were willing to perspire for the cause of Christian unity.

My space is almost exhausted, and I can but indicate in a word the underlying principles that have made such a movement and such conventions possible.

First, Deep religious devotion. There is no such compelling and attractive power as this. "For Christ and the Church" has always been the motto of the Society.

Second, Service for all and all for service. "No impression without expression," the latest word of the psychologist relating to adolescent youth, has been practically wrought out in Christian Endeavor methods.

Third, "Fellowship with Fidelity," "Brotherhood with all, loyalty to one's own "—these are the watchwords which are heard in Christian Endeavor circles all over the world, and which, incarnated in deed, have given the Society its power.

What of the future?

Let the historian of the fiftieth year of the Society prophesy after the event.

But it can be said in a general way that the outlook was never so bright as to-day; the Society was never winning its way so rapidly in all lands; its critics were never less destructive or more helpful; its supporters were never so numerous and courageous; and, with augmenting ranks, increasing flexibility, enlarging scope and variety of service, and a firmer grasp than ever on its fundamental principles, it is entering upon its second quarter-century with more than the vigor, hope, and determination of its earliest youth.

PERSUASION AND CONTRO-VERSY

BY BRANDER MATTHEWS

FEW years ago a colonel of the Civil War, who is now a Justice of the Supreme Court of the United States, delivered a Memorial Day address on the "Soldier's Faith," in which he suggested that it is perhaps " not vain for us to tell the new generation what we learnt in our day and what we still believe—that the joy of life is living, is to put out all one's powers as far as they will go, and the measure of power is obstacles overcome; to ride boldly at what is in front of you, be it fence or enemy; to pray not for comfort but for combat; to keep the soldier's faith against the doubts of civil life, more besetting and harder to overcome than all the misgivings of the battlefield."

It will be a sorry day for us when words like these of Mr. Justice Holmes fail to arouse an echo in the hearts of our young men.

"For never land long lease of empire won Whose sons sate silent when base deeds were done."

When the youth of America is ready to seek comfort and to shrink from combat, then the end will be near, and society will stagnate into a morass of moral malaria. Life is neither nirvana nor chaos; it is a never-ending struggle toward the Promised Land; and no sooner have we topped one hill than another still higher rises before us, which we shall find the easier to climb since our muscles have been hardened by the earlier effort. No sconer is one victory won than there looms large before us the next conquest to be undertaken. There is never a truce in the fighting, and

never a season when the armor may be laid aside. But of a truth the joy of living is in the putting forth of all our power in overcoming the obstacles which are more abundant and more difficult in civil life than on the battlefield, as the soldier-judge declared. Yet the more abundant they may be and the more difficult, the keener is the zest of combat, and the less worthy is the comfort which might come to us from giving up the struggle.

If, however, there is a cause in behalf of which it is worth while to battle, surely also it will be worth while to learn how to wage the war. Ardent youth is swift to enter on a civic campaign, often without training and without taking time to form a plan, although none of us is ignorant that the course of military instruction at West Point extends over four years; and it teaches only the elements of the art of war. If it is true that the conflicts of civil life are more exhausting than those in which the soldier engages. and that the maneuvers of the enemy are more baffling, then is there an obvious need of education for those, who are undertaking a civic struggle. They go forth to contend with evil, by calling the attention of the public to the impending danger and by awakening the interest of good citizens in the cause in which they are enlisted.

Here it is that a military metaphor becomes misleading. Although it is our duty to wrestle with wrong and to overcome it, we can win the fight only with the weapons of peace; and of these the most important is persuasion. We can

achieve our end only by so presenting our case as to bring over to our opinion the majority of our fellow-citizens. Undue aggressiveness is wholly out of place; it will never attract, it will always repel. No doubt the actual adversary must be faced boldly; but there is rarely ever any chance of converting him, for he is rooted in his own superstition, and he has his own reasons for the faith that is in him. It is not the opponent who stands up against us that we are striving to convince, since his case is hopeless. It is to the bystanders that every appeal must be addressed, to those who are looking on idly and without attention. If their interest can be aroused, if they can be converted to our view, then our adversary is beaten, even if he is stubborn to the end; for then the majority is ours, and he is only one of a shrinking minority. This is an aspect often overlooked by men who are naturally combative and who are lacking in the sympathetic appeal which wins adherents; they spend all their energy in the grapple with the individual advocate of the other side, and they pay no heed to the duty of persuading those who are not hostile, but only indifferent. Sometimes it seems as though their interest was rather in the argumentative duel than in the final decision of the debate.

Only those who have taken active part in urging an improvement or in assaulting an evil, ever realize how difficult it is to awaken the attention of the general public in behalf of any particular cause, and how protracted and wearisome a task it is to arouse any real interest in favor of it. The human units who make up the general public know little or nothing about any one topic, and they seem to care less. They have each of them their own traditions, their own prejudices, their own proportion of conservatism, their own distrust of innova-They have a strong desire to let well enough alone and to keep to the good old ways. Yet they are not resolutely hostile to any new proposal; they simply fail to see the necessity for it or to seize the significance of it. They are open to conviction, if you can once get them to listen to you while you show cause why your opinion should be adopted. They are all of them engaged in minding their own business; and they are loth to lend an ear to any one who asks them to listen to argument or even to evidence.

Yet it is these human units who are to be made to listen, who are to be won over, who are to be awakened from careless inattention and aroused to active interest. Whoever applies himself to this labor of love must possess his soul in patience and curb his temper with firmness. He must put up a good fight against the defenders of the condition which he is attacking, but he ought not to waste his strength mainly upon them. He must never let a delight in controversy tempt him to forget that his chief duty is not to argue with the other side, but to persuade the men who are taking no part in the dispute—the men who are ready enough to dismiss the matter from their minds, and who are prompt to cry "a plague on both your houses." These are the very men whose support, if only it can once be secured. will make success certain. Whenever they can be allured into listening to the facts, they are swift enough in coming to a decision on the merits of the case; and when public opinion has once been created in favor of a cause, all the protests of its opponents are useless and hopeless. There is no need to waste time in answering the arguments of the other side after the public has made up its mind.

It is not really argument which is effective, it is information. If once you can induce the public to believe that here is something that they ought to know about, if once you can get them to turn aside from their own work long enough to take in a plain statement of fact, then the rest is easy. But to get them to listen at all is not easy; it is very hard indeed, and it cannot be done in a hurry. It can be done only by patient and unceasing effort, which profits by every occasion, and which neglects no opportunity.

In this first approach nothing is more important than an unassuming manner. If you want to win the public to listen, you must be firm, of course, but you must not be condescending; for there is

nothing that human nature resents more quickly than being addressed in words of one syllable, as though it was infantile in understanding. And as you must not assume superiority, so you must avoid the domineering tone and the aggressive attitude which only too many reformers are prone to adopt. For example, there is little doubt that the ineffectiveness of Ruskin's eloquent crying aloud in the wilderness was due largely to his shrill scolding and to his contemptuous bullying. As the late Sir Leslie Stephen pointed out, "the arrogance of Ruskin's language . . . is one of the awkward consequences of being an inspired prophet," since "it is implied in your very position that your opponents are without an essential mental faculty." Over-emphasis always excites antagonism in the average man, just as over-statement arouses suspicion.

In fact, nothing is more effective than an under-statement so clear and so moderate that the listener is inclined to believe himself capable of restating your case more powerfully; for if he once undertakes this, he is your partisan forever, if only for the pleasure of arguing on your side better than you have done. As M. Émile Faguet has reminded us recently, "the great point of all dialectic and of all eloquence is to make men believe that they come to a decision of their own accord, that they are guiding themselves, that the idea which has just been given to them is one they have had since infancy." This is a difficult feat, no doubt, but it can be accomplished by a sincere speaker who is also adroit, as Lincoln was. It is never achieved by an exhorter who scolds and who bullies; the more he talks himself hoarse, the more he hardens the hearts of his hearers, fixed in their resolve to oppose him.

It is recorded that Benjamin R. Curtis once tried a law case against John P. Hale, and was astounded when the verdict went against him. "I had with me all the evidence and all the argument," he explained, "but that confounded fellow, Hale, got so intimate with the jury that I could do nothing with them." And we may rest assured that there was in Hale's manner, while he was dealing

with the men in the jury-box, nothing superior or condescending, nothing aggressive or domineering. He met them on the level of a common humanity, and he assumed that they possessed both intelligence and a desire to do right. It is comic to think how complete a failure Carlyle or Ruskin would have made had either of them been called to the Prophets of wrath they may have been, both of them, but sweet reasonableness was not their portion. They may have helped to destroy the temples of Baal, but whatever they sought to build themselves was built on the shifting sand. At best, they achieved only the easier feat of destruction, and they failed to accomplish the more useful duty of construction.

An illustration of the successful use of cogent under-statement can be taken from the history of the movement in behalf of international copyright. Only after half a dozen years of incessant endeavor was it possible to pass the act of 1891, whereby the protection of copyright in the United States was extended to the foreign authors who should comply with certain conditions. Previously foreign authors had no control here over their own writings, which were freely pirated, thus forcing American authors to sell their writings in unfair competition with stolen goods. Obviously, this was a bitter wrong alike to the friendly alien and to the citizen; but it was very difficult to make the average man see Winter after winter the members of the American Copyright League devoted themselves to the awakening of public interest. Meetings were held in the larger cities, and reports were published in the local newspapers and telegraphed all over the country; speeches were made before all sorts of societies; sermons were preached on the National sin of literary piracy; articles were inserted in the magazines and reviews; statements were put forth frequently in which the question was considered from every point of view; explanatory pamphlets were to be had for the asking; and no possible means of arresting public attention was neglected. And yet, after this propaganda had been going on for years, the advocates of justice

were continually surprised to meet men of education and of intelligence who had paid no attention to our appeals and who were not aware that there was a wrong to be righted. These men were very rarely hostile; they were only uninterested because of their total ignorance in the matter. Generally we found it easy enough to gain their sympathy, and sometimes even their active support. after they once understood what the need was for an improvement in the law. But they had been minding their own business, and they had chanced not to be reached by any of the multitudinous appeals that we had been making.

Some of the appeals, it must be confessed, were now and then declamatory and domineering; and it was apparently a reading of these unduly vehement documents which turned the late Speaker Reed against the cause. This was the more unfortunate as the time came when he was the one man whose good will was absolutely necessary. The friends of the bill believed that it would pass if it was allowed to come up; that is to say, if only the Speaker would grant a small portion of time in the final days of the session, always tumultuously overcrowded. Just then, as it happened, a member of the League published a paper from a new point of view, tracing the slow evolution of copyright ever since the invention of printing, and pointing out that the United States, which had been among the most progressive nations at the end of the eighteenth century, was among the most backward in this respect at the end of the nineteenth. The writer of this paper was studiously moderate in tone, and he strove to force the reader to draw his own conclusion—that the opportunity was then offered for this country to recover its proper rank among the nations. A member of the Copyright League—who is now the President of the United States—asked the Speaker to read this article as a personal favor to him, and the next day Mr. Reed told Mr. Roosevelt that he was ready to grant time for the passage of the bill.

Probably it was the cautious understatement of this paper which captured the sympathy of the Speaker, and quite

possibly the vehemence of some of the other appeals which had repelled him were more effective with readers of another type. The very manner needful to arouse the interest of one man another may reject as rant. There are all sorts and conditions of men, and they cannot all be converted by the same arguments. But, however emotional the speaker, however lofty his standard, however assured he may be as to the moral necessity of the step he is advocating, he will fail to reach the hearts and to touch the minds of his hearers unless he is ever honest with himself and unless he is absolutely fair to his opponents. If he descends to personalities, he may amuse his audience, but he is far less likely to bring them over to his side. Indeed, the sincere advocate of a cause will often accomplish most by resolutely refusing to acknowledge the existence of his opponents as persons. In stating his own case he will meet their arguments fairly, refuting them as best he can; but it will be arguments that he will attack, and never the persons who have put forth the arguments. Especially will be refrain from misjudging the good faith of those who urge these opposing arguments; for, by the very fact that he has been willing to enter on a debate with them, he has placed himself on the same plane, and whatspever debases them lowers him Any man seeking to persuade will do well to refrain from controversy. was Dr. Holmes who drew attention to what he wittily called "the hydrostatic paradox of controversy," pointing out that "controversy equalizes fools and wise men, and the fools know it."

The wise men know it also; and they keep out. They know that controversy, in the narrow meaning of the word, is useless, and worse than useless, even if it does not descend into the rude exchange of offensive personalities. They know, as Sainte-Beuve has declared, that "after half an hour of any dispute no one of the contestants is any longer in the right, and no one of them is then really aware of what he is saying." They know that public interest very soon ebbs away from a dispute between persons, and that public opinion is likely to accept what each side says against the other and to

reject what each side says in favor of itself. They know that a prolonged debate is likely to defeat the interest of those who are in the right and to raise a dust of side-issues for the profit of those who are in the wrong. They know that nothing is more hopelessly uninteresting than a controversy which has died down to its ashes—ashes in which there may be heat enough but never any light. They know that protracted controversy is fatal to persuasion, and that persuasion is the only means of carrying a cause to victory.

Not a few wise men have carried this distaste for dispute so far that they have resolutely refused to pay any attention to personal attacks. Buffon was one of these; and he explained that he took pride in the thought that persons of a certain kind could not injure him. Ibsen advised Georg Brandes to adopt the same attitude—"Look straight ahead; never reply with a word in the papers; if in your writings you become polemical, then do not direct your polemic against this or that particular attack; never show that a word of your enemies has had any effect on you." Jowett summed up his own principles in a terse sentence: "Never retract, never explain; get it done, and let them howl." And this is only a new setting of the old Scots saying, "They say. What say they? Let them say." Silent contempt is often the most crushing rejoinder; it is the true vengeance of large souls; and it is the one way open to all who are seeking to persuade and who are determined to abstain from bickering. A good workman is not known by the chips on his shoulder.

In attacking an established abuse, the ardent advocate of improvement will find himself confronted by opponents belonging to several different classes. First of all, there are those who are conservative by nature and who are moved to defend the established order of things simply because it is the established order, and because they dread and detest innovation of any kind; and these can often be won over by showing that the proposed change is not really an innovation, but rather a return to the practice of the fathers and to the usage of the good old

days. Second, there are those whose good faith is beyond question, but whose temperament leads them to defend the existing situation in spite of its defects; and these are the men whose opposition is most difficult to overcome, because they are honorable adversaries, possessed of the best intentions. They must ever be faced firmly but courteously; and their arguments must be met squarely. It was of opponents of this type that Gladstone was thinking when he said that "the one lesson life has taught me is that where there is known to be a common object, the pursuit of truth, there should be a studious desire to interpret the adversary in the best sense his words will fairly bear."

And then there is a third class, of those who are personally profiting by the abuse which you are attacking; and it is from these that you may expect the bitterest fight and the most unscrupulous. They will never hesitate to resort to the meanest of personalities and to the imputing of the lowest of motives. They will seize any weapon that comes handy; and they will never hesitate to strike below the belt. This is an unsavory opposition, which must be anticipated; as the "Autocrat of the Breakfast-Table "declared, with his pithy shrewdness, "you never need think you can turn over any old falsehood without a terrible squirming and scattering of the horrid little population that dwells under it." But although the defense of an abuse by the men of this type, who are touched in their pocket. will always be venomous and protracted, it is likely also to be so violent and so hysteric and so offensive as to repel the sympathy of the disinterested onlookers in whose hands the final decision lies.

As a general rule, it is safest and wisest to disregard the ululations of unworthy opponents of this type or of any other; but sometimes a rare occasion may arise when it is needful to turn on an opponent, and to smite him hip and thigh, and to reduce him at once to impotent silence; and this is what Huxley did to the Bishop of Oxford. Sometimes again the chance may present itself to puncture an adversary with a swift retort, just as Leatherstocking caught by the handle the tomahawk the

Indian had thrown at him, hurling it back at once to bury itself in the brain of his red foeman. Once when a noted wit was holding forth, a drunken bystander broke out with "You're a liar!" To which the noted wit returned, instantly and with the utmost suavity of manner, "Surely not-if you say so!" When Beecher was addressing a meeting in Liverpool packed with Southern sympathizers, a voice from the gallery asked him why we had not ended the war in sixty days as we had said we would. There was a pause in the tumult at this home-thrust, and Beecher took advantage of it to reply, "We should have done so, if we had been fighting Englishmen !" To the credit of his hearers, this bold stroke touched their sense of fair play, and thereafter they listened to what he had to say.

But though this may be successful, it is ever dangerous, for it is perilously close to the flinging to and fro of empty personalities. If the foeman is unworthy of your steel, and if you suspect him capable of a foul blow, it is best to refuse to cross swords with him. There was common sense in the saying of Truthful James, in his metrical minutes of the meeting of the "Society upon the Stanislaw," when he declared that

"I hold it is not decent for a scientific gent To say another is an ass—at least, to all intent:

Nor should the individual who happens to be meant

Reply by heaving rocks at him, to any great extent."

The general public takes no interest in the bandying about of personalities;

and it is even inclined to despise a victory won in such ignoble strife. On the other hand, it is swift to give its confidence to those whom it has observed to be honest to themselves and fair to their adversaries, moderate in statement and dignified in utterance. And it is the general public which must decide the question at last; and the general public is ever repelled by unseemly altercation; and it can be reached only by incessant and unassuming persuasion. He who seeks to convert it must be patient and persistent, coaxing the general public to go forward with him one step at a time, and taking care that there are no steps backward. He must remember the potency of little drops of water and of little grains of sand. He must not try for too much all at once; but he must ever be ready to take what he can get, and he must always be glad to convert an individual here and there, since the general public is only a mass of stray individuals.

Above all else must the advocate of a new cause and the assailant of an old abuse respect the opinions of those he is striving to convert. He must ever bear in mind that the average man, the unit which is multiplied into the general public, means to do right—that the average man is ever ready honestly to echo the fine phrase of Marcus Aurelius: "If any one is able to convince me and show that I do not think or act right, I will gladly change. For I seek the truth, by which no man was ever injured. But he is injured who abides in his error and ignorance."

Comment on Current Books

The Climbers We cannot say that Mr. Clyde Fitch's plays "read" as well as Mr. Barrie's or Mr. Bernard Shaw's. They were made to act, and with little thought of literary effectiveness. "The Climbers" had a considerable degree of success on the stage, and has some well-devised situations. (The Macmillan Company, New York. 75 cts.)

The feature of special The Conquest of interest in the revised Arid America edition of William E. Smythe's stimulating account of the part played by irrigation in the opening up of the West is the section devoted to a résumé of the progress made since the book first appeared, five years ago. Mr. Smythe was himself a pioneer in the National irrigation movement, and is thoroughly competent to serve as its historian. He is, moreover, imbued with the hearty, optimistic spirit of the West; and if at times he appears overenthusiastic, his picture of the past and present is none the less significant for the possibilities it reveals. Intending home-seekers will find much practical information in his pages, while readers of all types will derive therefrom a larger knowledge of the States in which the work of colonization is now being pressed so vigorously. Mr. Smythe's book falls into four parts. In the first he discusses colonization and irrigation in a general way; in the second, some of the earlier irrigation ventures; in the third, the several arid and semi-arid States which remain to a greater or less extent undeveloped; and in the fourth, the genesis and evolution of the movement which has led to the intervention of the United States Government in the task of reclaiming the desert parts of our country. He also supplies, in an appendix, the text of the original Newlands Irrigation Bill and of the present law, and a brief statement of methods of irrigation. In addition to revising the text, he has incorporated new illustrations from recent photographs. As it stands, his book is invaluable to all who would make themselves fully acquainted with the internal territorial expansion of the past few years. (The Macmillan Company, New York. \$1.50, net.)

The
Life of Froude
Froude. His admiration lends a charm to his volume, but also imparts to it its two chief defects: it could be lessened in bulk with advantage, for it contains repetitions

more appropriate to a speech by a defendant's counsel than to a biography; and its tone is throughout too much that of one who is retained to defend an accused from attack. But in the main we agree with Mr. Paul's Mr. Froude was bitterly interpretation. assailed by three classes of enemies: first, by ecclesiastics, for his liberalism in theology; second, by scholastics, pre-eminently by Mr. Freeman, because he was guilty of making history interesting; and, third, by the devotees of Mr. Carlyle, because he ventured to tell the truth about their hero. In all three cases there was some excuse for the attack. Mr. Froude's reaction against orthodoxy carried him, as Mr. Paul admits, too far; but atter reading Mr. Paul's account of Froude's childhood, the reader wonders that the youth was not carried over into blank atheism. In writing history Mr. Froude, though conscientious in his investigations, was not always careful in matters of detail, nor was this carelessness confined, as Mr. Paul seems to imply, wholly to proof-reading; and his dramatic instincts led him sometimes to accept minor incidents which were inadequately verified though not inherently improbable, because they furnished such effective color to his narrative. But he was one of England's really great historians; in our judgment a far better historian than Freeman; because a true understanding of character and a true interpretation of events is far more important than minute accuracy in dates or the spelling of names. No historian has done so much as Mr. Froude to interpret aright the English Reformation and its great characters, no one so much to explain Henry VIII., and no one so much to dispel the romantic mystery which has enveloped the character and career of Mary Queen of Scots, who deserves to be ranked, as Froude's realistic portraiture has ranked her, with Jezebel of Israel, Lucretia Borgia of Italy, and Catherine de' Medici of France. There may be a question whether he ought to have told at all the story of Carlyle's domestic infelicities. We have no question that in telling it he took somewhat too seriously Carlyle's exaggerated expressions of remorse. But in the main the fire of criticism to which his narrative has been subjected has had no other effect on those who have read the voluminous literature on both sides, if they are accustomed to weigh and measure evidence, than the conclusion of Sir James Fitzjames Stephen: "It is to me wholly incredible that anything but a severe regard for truth,

learnt to a great extent from his teaching, could ever have led you to embody in your portrait of him [Carlyle] a delineation of the faults and weaknesses which mixed with his great qualities." (Charles Scribner's Sons, New York. \$4, net.)

Under the title "The Journeys La Salle's of La Salle and His Compan-Journeys ions," Professor L. J. Cox, of the University of Cincinnati, has edited the original narratives of Tonty and others of that intrepid band of explorers. Some of these narratives have been difficult of access, and certainly they all abound in stirring adventure and incident. Professor Cox's characterization of La Salle is worth quoting: "He was coldly ambitious, reserved to hauteur, over-confident in his own judgment, with great natural ability and equal determination, imaginative to a fault, and consequently often more visionary than practical. . . . The essential failure of his colonizing and monopoly projects should not obscure his real services as the greatest French explorer of the Mississippi Valley." (A. S. Barnes & Co., New York. 2 vols. \$2, net.)

F. B. Kirkbride and J. E. The Modern Sterrett meet a real need Trust Company with this book. The modern trust company is so essentially a modern institution that hitherto there has been no account of its organization and operations written with the fullness necessary to enlighten the general public. The present work, however, is so complete and lucid that it should serve as a standard guide not only to the public but to students of banking and finance, and deserves wide recognition as an authoritative text-book. No detail of trust company functioning appears to have escaped the authors, who further proffer numerous suggestions of solid value to the management of such concerns. The point of view is soundly conservative, and there is little theorizing, concreteness being the distinguishing characteristic throughout. The practical usefulness of the book is increased by the reproduction of a number of the forms best adapted to facilitate the conduct of business. (The Macmi'lan Company, New York. \$2.50, net)

Nation
Builders

This saga of the early days of American Methodism vindicates the fact which its title assumes. Home missions among the pioneer families who planted themselves in the wildernesses now transformed into civilized States made the American people what it is to-day—a people dominated by moral sentiment, and stamping its National coinage with the most widely circulated of all confessions of relig-

ious faith, In God We Trust. In this work of nation-building the itinerant Methodist preachers bore not the only but still the leading part. Especially in the Central States, with which this volume is largely concerned, they made a record of ever-memorable courage, patience, and fervor. The history of the circuit-rider is closed. But there is no part of our National history which more deserves to be treasured in living memory. It is a continuation of the Acts of the Apostles. The experiences of its heroes here related have a stirring martial note, as well as a fascinating personal interest. The plan, with a small portion of the story, comes from the late Andrew Carpenter Wheeler, known also by his pen-name, J. P. Mowbray, to whose friend, Mr. Edgar Mayhew Bacon, of Tarrytown, New York, its completion is due. (Eaton & Mains, New York. \$1.)

Two-fifths of this volume is The Prevention occupied with the essay of and Cure of Dr. S. A. Knopf, of New Tuberc closis York, selected in 1900 from eighty-one competitors to receive the prize of \$1,000 offered by the International Congress at Berlin for the best treatment of the question how to combat tuberculosis as a disease of the masses. This essay has already been translated into many languages. To this are added a dozen or more short chapters by various authors, which the compiler, Mr. Joseph R. Long, has drawn from the "Handbook on the Prevention of Tuberculosis," published by the Charity Organization Society of New York, and other sources. The non-professional reader will find here what every one should know concerning "the great white plague," its prevention and its extirpation. (H. M. Brinker, Denver, Colorado.)

S. A. Clarke, the author Pioneer Days of of this unique and inter-Oregon History esting contribution to the history of the Pacific Northwest, is himself an Oregon pioneer, having made his home in that State since 1850. He has for many years studied and written on the history of the region, and his present work, which comprises two substantial volumes, is intended, in his own words, as a last tribute to the people of Oregon, "who for half a century have been my kind and indulgent friends." His object is to set forth the story of the growth of Oregon from the earliest days of discovery and exploration to the establishment of a territorial government, and this he does in an original and unconventional way, preserving chronological unity, but expanding the narrative by the inclusion of a mass of material not commonly found in historical worksreminiscences of missionary, fur-trader, trapper, and mountaineer, descriptions of Indian life and characteristics, Indian folk-lore, firsthand accounts of romantic and tragic episodes of early settlement, etc. Necessarily his work contains a good deal of little more than local interest, and from the standpoint of the critical historian is in some respects open to serious objection. But it is not without value for the light it sheds on a civilization already of the past, and for the fact that it preserves much of historical interest which might otherwise be lost. Mr. Clarke's style is plain to the point of awkwardness; but his book is undeniably readable and should attract an audience not limited to those to whom he primarily addresses himself. (J. K. Gill Company, Portland, Oregon.)

In creating a work of Spiritual Adventures art one has to be relentless in the rejection of material. Mr. Symonds, in his "Spiritual Adventures," has applied the principle of selection rigorously. He presents in this volume eight studies in temperament. In each study he is intent on reproducing a distinct temperamental type; or, to put it another way, in each case he has isolated a temperament and assigned it to a person. In real life, of course, temperaments are not apportioned out to people in that fashion; but these studies do not purport to be records of real life. They are pictures. Each study has a tone of its own as truly as a painting by Whistler. Traits which would mar the tone of a study are not even suggested. Some readers may find a certain intellectual stimulus in reading this book, just as some people find religious stimulus in looking at a Giorgione; but those will judge it best who read it as a work of literary art. As such it is undoubtedly skillful. Among the writers of to-day who regard the pen as a craftsman's tool Mr. Symonds cannot be ignored. These studies, however, show more skill than sense of beauty. There is scarcely a tint of cheerfulness or real health in the series. The tones are all too gloomy. No artist can wholly escape responsibility for his choice of subject. Like the pictures painted by one of the men here portraved, these studies not only have a hint of unhealthy green in their shadows, but have for their subjects the abnormal or artificial. No matter how impersonal the reader tries to be, he will probably close this book with a sense of depression. (E. P. Dutton & Co., New York. \$2.50, net.)

Eight biographies have J. M. W. Turner already been written with Turner as their subject. His was a puzzling character, and criticism of his works is apparently occupying less space in the late than in the early biographies. The latest of all is the work, not of a literary man, but of a painter. Mr. Wyllie has a true brotherpainter's sympathy for Turner's troubles and trials, rough and uncouth as was that worthy. As to Turner's works, an artist is, of course, better able than a mere teller of tales to distinguish the difficulties, limitations, beauties, and influences of a painter. However sympathetic Mr. Wyllie's attitude, he may well envy the literary man's style. The latest biography of Turner is not brilliant in that regard, though Mr. Wyllie's language is undeniably clear and concise, especially in his replies to certain assumptions-notably Ruskin's-about Turner which Mr. Wyllie thinks unwarranted. (The Macmillan Company, New York. \$3.)

This story of the East The Wisdom of Side of New York is the Simple chiefly interesting because of the personality of the author, Owen Kildare. His first book, "My Mamie Rose," was hailed as a remarkable achievement because the author, as he told in that book, was at the age of thirty a "Bowery tough" who could not read or write his own name. The present volume describes the careers of two boys on New York's East Side, with a little too much of the atmosphere of the oldfashioned Sunday-school book to be a good story. (The Fleming H. Revell Company, New York. \$1.50.)

A clever, readable story by A Yellow Miriam Michelsen, the author of Journalist " In the Bishop's Carriage" and "The Madigans." It describes the experiences of a young woman reporter on one of the yellowest of American newspapers. Her quest for "copy" brings her into intimate relations with public and private scandals, family quarrels, divorce cases, and murders. The unscrupulous methods which she pursues in the attempt to score a "beat" for her paper are hardly less repellent than the details of the cases themselves. The young woman is a very entertaining person, but not even the attractiveness of her personality makes "yellow journalism" seem anything but vulgar and degrading. (D. Appleton & Co., New York. \$1.50.)

Letters to The Outlook

ARIZONA AND STATEHOOD

In the issue of The Outlook for December 30 there is an editorial on the Statehood Question which contains such a gross misstatement of facts in regard to one phase of that subject that I am sure you will welcome a contradiction of the same. I refer to that part of the editorial which relates to Walter Wellman's article in the Chicago" Record Herald," and the" railroad and mining lobby "in Washington. Now, it has been my privilege to be associated the past four weeks in a very intimate way professionally with the man who, outside of Congress, has been leading the fight against joint Statehood for Arizona and New Mexico. This man has had more to do with the marvelous development and progress of Arizona than any other one man, and he is at the present time unquestionably the leading citizen of that Territory, and it is this individual, together with his brother, an honored ex Governor of the Territory whose home is in Washington, who have constituted the "railroad and mining lobby" referred to in your editorial. Having been in a position to be thoroughly acquainted with the methods and tactics pursued by these gentlemen in their opposition to "joint Statehood," I wish emphatically to state that their conduct in this matter has been honorable and beyond criticism, and such that no advocate of pure political methods could take the slightest exception to it. As a matter of fact, it has been their clean-cut method of opposing the bill in question that has been a real element of their strength as they have come in contact with the members of Congress. To these latter they have repeatedly said, "All we ask is that you will not act in this matter until you have thoroughly investigated the conditions in the Territories; and if you will only do this, we fear not the result." Well indeed would it be for Congress and the legislation it enacts if in connection with all questions of public policy it could have the help and advice of such clean and honorable "lobbyists" as are the men to whom this communication refers-men who are fighting with clean hands and right motives for the Territory they love and which they have been so instrumental in developing.

CHARLES E. BARKER.

FACTS ABOUT ARIZONA

In your issue of December 16, pp. 911 and 912, there are a few misleading statements which no doubt you will gladly correct when

your attention is called to proper data. Twelfth Census, our population was 122,931 -inclusive of 26,480 Indians-net 96,451; there is where the 29 per cent. of illiteracy came in. Same volume, pages 909-13, you will find that the native white illiterates are only 4.5 per cent., while in the whole United States the percentage is 4.9. You note 7,000 Mormons; eliminate the women and children, leaving 1,378 voters, not a very large factor in 44,081 voters. It is a fact that this is a rapidly developing mining territory. In 1902 there were engaged in this industry 5,323 persons, about 4.5 per cent. of population, while in agriculture we have 16,174, or 13.1 per cent. of population. Males of working age, fifteen and up, show 30.3 per cent. engaged in agriculture (United States Census, Vol. 2, p. 508). There are in culture now about 257,000 acres—less than one-third of the available land when irrigation works in progress are completed. With the large holdings subdivided, no farmer can individually do justice to over forty acres; there will be room for a quarter of a million agriculturists. New Jersey has only 68,881; Pennsylvania, 341,712; Connecticut, 44,796; Massachusetts, 66,551, etc.; so in ten years' pro rata progress with past ten years we will show a good general average with any State in that line-based upon the fact that farming pays upwards of 150 per cent. better than the general average of the whole United States, and our methods are yet very crude.

I inclose twenty pages of solid facts if you care to be further informed, a 1 pray for your good services to aid us in o r desire to be let alone and work out our salvation on merit.

SILAS ST. JOHN.

Prescott, Arizona.

[Some of Mr. St. John's figures are either ambiguous or inaccurate. According to the Twelfth Census, of the total native white population (over ten years of age) the percentage illiterate in the United States is 4.6, while that in Arizona is 6.2. The detailed statistics are, however, of little importance. We took the figures in the Senate Report on the Statehood Bill as sufficiently worthy of confidence to be used in round numbers. At best our correspondent's statements and those in the pamphlet containing "twenty pages of solid facts" are in refutation of the arguments for joint Statehood with New Mexico; they furnish even more ample arguments against single Statehood for Arizona. -THE EDITORS.]

STATE CONTROL OF CORPORATIONS

[The following letter, coming from a Justice of the Supreme Court of Pennsylvania, deserves, by reason of the character and position of its author, careful consideration. It does not, however, modify our conviction, for reasons often given, that corporations engaged in inter-State commerce must be brought under the Federal control; that no State control is or can be adequate.—The EDITORS.]

For the most part I agree so thoroughly with the views of The Outlook that it only emphasizes an occasional point of difference. In the last issue you repeat a statement which, in my judgment, ought not to pass without protest. You say, referring to Federal control of corporations, "proper control is no longer possible by the single State which creates corporate existence." I beg leave to question sharply the accuracy of this statement, and I submit that it has no foundation in fact. On the contrary, the State which creates corporate existence has the power of complete control over its creature, as absolutely as has the potter power over the clay which grows into shape under his hands and which takes the form that he gives to it.

A corporation can do nothing except that which by its charter it is authorized to do. It is in this respect limited—like the powers of the Federal Government. It can do that only which its charter expressly or by fair implication gives it the right to do.

Plainly, then, the remedy for wrongful action by corporations lies in limiting their powers, when they are being created, and by supervising them more closely, by the same authority which called them into being.

Does any one doubt for a moment the power of the State of New York to supervise and control to any desired degree the insurance companies chartered by that State? Certainly not. Insurance companies can be controlled by the State to just the same degree and with the same success as are the savings banks. The only trouble heretofore is that the State has not attempted to discharge this duty. But her ability to do it cannot be questioned.

Neither can the right of each State to protect its people against the inroads of loose or unsafe corporations organized in other States be questioned. Under the principle of comity between the States, a very broad and liberal practice has grown up of permitting practically free and unrestrained access to the people of the various States by corporations of other States. But this principle has been carried too far, and has been

abused. Here again the power to protect themselves is ample, and needs but to be called into play. The American people are entirely capable of protecting themselves in all of the several States and in each community.

The real danger in any attempt at contro! of corporations by the Federal Governmen? is that it would be made the excuse for preventing the people of the States from guarding their own interests. Under the plea of a Federal license, the dangeous and predatory concerns would claim the right to invade the whole country, without regard to the protests or sound requirements of the States that might desire to protect their people. We are not infants. We do not require the protection of any Bureau at Washington. In fact, supervision by the National Government would be a farce. No matter how good the intent might be, it would be impossible to supervise the business interests of this great, vigorous country of ours by any bureau of clerks at the National capital. Such an attempt would be unwise and un-American. We believe in home rule, and the right and duty of self-government in this country; and it would be a sorry day indeed when the people of any State in the Union acknowledge their inability to protect themselves from the evils and dangerous practices of a corporation created under the laws of their own State, or that of any other State of the Union.

Just give the people a chance. Do not fetter them or tie their hands by any attempt to take from them the power of control, by centralizing it at Washington, and there will be no difficulty in properly protecting every right and in preventing its invasion. No greater calamity could befall us as a Nation than the formation of the habit of looking to Washington for help, instead of helping ourselves at home. The curse of Russia is its system of bureaucracy and centralization. Let us not turn our faces towards a system which Russia is struggling to throw off. Urge, rather, the assumption of thorough and reasonable control by each State over the corporations which it creates, and the exercise of the right by each State to exclude from its borders such corporations, created by other States, as do not comply with its own reasonable requirements enacted for the protection of its own citizens. In other words, let each State require from the stranger within its gates the observance of the same rules and regulations which it imposes upon its own people for their own good. Were this done, there could be no reasonable com-W. P. POTTER.

Supreme Court of Pennsylvania, Justices' Chambers, Pittsburg, Pennsylvania.

I Can Make You Well, Strong and Beautiful

LIFU DOS

EVERY WOMAN should preserve her health, firength, beauty, poise and, with these, her happiness. It is my secres in treating nearly 18,000 women and my knowledge of what my work has done for them that makes me know I can do as much for you.

Let me give you a perfectly balanced segmans. Let me direct your breathing, your exercise, your det; let me give you a passed blood supply and circulation; a servous system in harmony with itself and the set of your body, each nerve center properly directing the organ it controls. The resultant strong vitality will enable you to resit disease, and I will make you what you were intended to be strong, happy, graceful, bountiful—loving and belowed, with a mental calm, which is life power and true beauty, making your life a satisfaction to yourself, making you the delight and admiration of your finends.

Only 15 Minutes a Day each day, in your own home, by following my simple directions. Just a little care is all you need to make you the ideal woman of your type. Do not say it is impossible, that matter has not given you the first requirements of health she beauty—I know it is possible; I have accomplished it for the means.

Drugs are Dangerous

use no drugs. I never treat a pupil cannot help. If I cannot help you, I

Women Young
Do you think
"True Mother-hood" means de-I Keep

wothness a outing hood means dewothness a mother to her family and neglect
of herself? True?—No, the true mother is true to her sacred duty of preserving and protecting herself, that
the may be of greatest service to her family. The mother needs health, strength and lightness of heart that
the may be a true wife —the delight of her husband, his joy, rest, social help and inspiration, not a slaving,
sufficient dead-weight for his pity.

The true mother keeps well, beautiful and young, that she may enjoy the confidence and admiration of her children and be their guide and welcome councillor.

If you could sit beside me, at my desk, I could, if I would, show you, daily, hundreds of letters from pupils I have helped. I never violate a confidence, never show a letter without permission, but here are a few snatches from one morning's mail:

- What My Pupils Say of My Work

I wish every nervous teacher could know what benefit is to be derived from our physical culture.

I have loft 75 pounds, and was never better. I look ten years younger. My constipation and biliousness are entirely referred.

Just think how I have gained, since I began with you, from 112 to 137½

in one year pounds in one year.

My catarrh and lungs are much better and my body, which was a bony, crooked structure, is actually beginning to look like your picture of correct poise. My head is steady, the confused feeling having passed away. It is the set spent money ever used for myself.

Just think, Miss Cocroft, before I took up your work I could not eat anything without the greatest distress, and now I think I could DIGEST TACKS. I am so happy.

How to Stand and Walk my methods, and given your symptoms and condition. When you request details about my lessons, I send you my general book free. This outlines free, my lesson on Poise, which teaches you how to stand and walk.

Personal Besides the Book and free lesson, in answer to your first inquiry, is included my personal examination of your symptoms and my first advice to you. Write me fully about your case, also letting me know your faults whether I can help you or not. Your letter will be held in strict confidence.

I never publish letters without special permission, though I can send you hundreds of testimonials from women I have helped, who are only too glad to have me show their letters.

Number 3

CONTENTS	
THE WEEK Railway Rate Regulation	Half a Loaf
THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures. PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy. POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.	

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

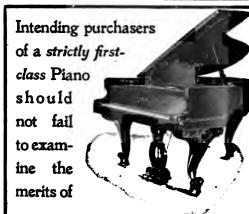

LETTERS should be addressed:

he Outlook

SATURDAY, JANUARY 20, 1906

As Representative Hep-Railway Rate burn is Chairman of the Regulation Inter-State Commerce Committee of the House, his railway rate regulation bill has been awaited with special interest. It seems to be more comprehensive than any yet presented. It broadly defines "transportation" as follows:

Transportation shall include cars and other vehicles and all instrumentalities and facilities of shipment or carriage, irrespective of ownership or of any contract, express or implied, for the use thereof, and all services in connection with the receipt, delivery, elevation, and transfer in transit, ventilation, refrigeration or icing, storage and handling of property transported.

The bill also provides that—

It shall be the duty of every carrier subject to the provisions of this act to provide such transportation upon reasonable request therefor, and to establish through routes and just and reasonable rates applicable thereto.

The requirement that the railways should regulate refrigerator cars more satisfactorily by furnishing icing is regarded as a specially distinguishing feature of this "Midnight tariffs" are also to be bill. abolished by a provision that no schedule is to be changed without thirty days' notice. Failure to publish rates makes the common carrier amenable to a writ of mandamus issued by any United States Circuit Court, and failure to comply with the requirement that, to be lawful, rates must be just and reasonable, is punishable for contempt, the Commission being empowered to apply for an injunction against any common carrier to restrain it from doing a transportation business until the provisions of the bill are complied with. The Commission is authorized to determine and prescribe a just and reasonable maximum rate; its order is to go into effect thirty days after notice to the carrier, and is to remain in force unless suspended or

set aside by a court of competent juris-Violation of the Commission's diction. order shall subject any carrier to a fine of five thousand dollars for each offense. The various District Attorneys are to prosecute for the recovery of such forfeitures. The bill increases the Inter-State Commerce Commission to nine members, stipulates that they shall be appointed for a term of nine years (not more than five men from the same political party), and fixes the annual salary of each member at \$10,000. The Commission is to have access to all records and accounts kept by carriers. Present indications point to a concentration of effort in the House to press the Hepburn Bill.

A Protest Against

Widespread dissatisfaction in Kansas Excessive Rates with the freight rate situation found expression early in January in a public convention held in Wichita at the invitation of the Commercial Club of that city. Letters were sent to leading men throughout the State inviting their attendance for the purpose of upholding the Kansas delegation in Congress "in the fight which they will be called on to make for legislation which will give the country at large, and especially Kansas, relief from unjust discrimination and excessive freight rates;" and of insuring the nomination of officials, both State and Federal, who should represent the people on these important questions. In response to this call several hundred delegates assembled, and adopted resolutions asking Congress to confer rate-making authority upon the Inter-State Commerce Commission, the rates to become effective within a reasonable time, subject to the review of the Supreme Court; favoring a uniform system of railway bookkeep

ing under supervision of the Inter-State Commerce Commission; urging the enactment of a law forbidding railroads to issue passes to any persons except employees; and declaring for a direct primary vote for the nomination of all officers, including United States Senators, in order to minimize corporation influence. The most important work of the Convention, however, was its organization of the Kansas Civic League, modeled after the Municipal Voters'. League of Chicago. It was decided to name an Executive Committee of Sixteen. two from each Congressional district. which in turn is to select an executive committee of five to report on the acceptability of all candidates for public office. These committees are to keep watch of the records of all officers, with a view to ascertaining especially their susceptibility to corporation influences. These records are to be printed, and the organizers of the movement believe that Kansas sentiment is such that the Civic League's report will have a powerful influence in determining elections. Such well-known men as J. L. Bristow, ex-Assistant Postmaster-General, Governor Hoch, and William Allen White are behind the movement.

€

There has been introduced The Tariff into Congress by Representon Art ative William C. Lovering a bill to remove the tariff from paintings in oil or water-color, statuary, sculpture, drawings, engravings, and etchings. This measure is not a new one. It has been introduced into a previous Congress by Mr. Lovering, and the movement to attain this end has been active for a number of years. There are only two possible arguments for the retention of the tax on works of art. First, that it affords protection to American artists. argument is effectually disposed of by the attitude of the artists themselves, who are practically unanimously opposed to the tax as it now stands. They do not want protection, and they resent the suggestion that they need it. second argument is that the rich people of the country should bear their share of the taxation. If the poor man is to have

the price of his tea, coffee, and tobacco increased by the tariff, the rich man should have the price of his paintings and statues increased. Experience has shown, however, that the tax does not produce revenue in any considerable amount. It simply acts to prevent the importation of works of art, which does no good to any one. A tax on art, moreover, is not a tax on the rich. Works of art are not altogether the possession of their owners; the canvas or the marble may be the property of the rich, but the art, which gives value to the canvas or the marble, belongs to any one who can enjoy it. Thus persons of moderate means and even of downright poverty may share with the wealthy every benefit that a work of art bestows. Experience has shown that the people actually do receive such benefit. Many paintings and sculptures find their way from private collections into public museums; but even those which remain private property are to a great degree made accessible by loan exhibits. It is to be hoped that a second bill, now before Congress, also bearing Mr. Lovering's name, which would limit admission to the free list to those articles which shall have been manufactured or produced at least fifty years before importation, will have the fate it deserves. Absolutely nothing can be said in favor of its distinctive feature, except on the ground of protection. Such ground in the case of art is a veritable swamp. Yet even this bill, by providing that the tariff be removed from all objects of art fifty years old, would at least give us free access to the art of the world of two generations ago. As it is now, the man who would enrich this country with the work of any European or Oriental artist must pay a fine as if he were committing an offense.

660

The German-American Tariff The new German high-tariff law goes into ef-

fect on the first of March. Its minimum rates cannot be offered to this country in return for such feeble concessions as the Dingley Act empowers the President to grant in exchange. This situation

has caused two bills to be presented in Congress for a maximum and minimum The first of these was presented in the Senate by Mr. Lodge, of Massachusetts. It provides for a reduction below the Dingley rates to nations according tariff concessions to American products, and imposes an increase over the Dingley rates to those countries which accord no such concessions. The second and more drastic bill was introduced in the House by Mr. McCleary, of Minnesota. It provides for a twentyfive per cent; increase over the Dingley rates on imports from all countries which fail to give to the United States the lowest rates given to any nation, leaving the existing Dingley rates as the minimum tariff. During the past -week Senate and House leaders have been in conference over the general question. They propose that the President shall be authorized at his discretion to issue a proclamation making the maximum tariff applicable to any country which unjustly discriminates against American products. If the McCleary bill is decided upon, or even the Lodge bill, the impression obtains that Germany would not submit to the proposed enactments without taking retaliatory steps. The question then arises, Is Germany or America in a better position to sever all trade relations? We sell to Germany twice as much as we buy from her. More than half our exports to Germany are in raw cotton; it is argued that if the cotton factories of the Fatherland are to be kept running, Germany must continue to buy cotton in America. On the other hand, we must not forget how necessary the prosperity of other German manufacturers is to the American as to the German people. Such a proposition as the McCleary measure, however, is not tariff revision; it is tariff reprisal.

•

The Panama
Canal

Secretary Taft has thought it worth while to reply explicitly and exhaustively to the charges of maladministration of affairs on the Isthmus made by Mr. Poultney Bigelow in an article referred to in The Outlook last week. Indeed, the fact that so complete and minute a statement,

covering every charge in such detail, could be made almost instantly at Washington, shows in itself how thorough is the knowledge possessed by the Administration of everything connected with the practical working of the Canal plans. Secretary Taft's reply to Mr. Bigelow's charges, taken in connection with President Roosevelt's special Message to Congress, already quoted in The Outlook, in which it is declared that "the work on the Isthmus is being admirably done and great progress has been made," together also with the full report of the Commission, lately made public, will convince fair-minded people that no credence is to be given to vague accusations " of jobbery or immorality or inefficiency or misery," to quote the President's words, and that he rightly attributes most of these statements to "irresponsible investigators of a sensational turn of mind," or to individuals with a personal grievance. Congress has accepted the President's suggestion for a full investigation into present conditions on the Isthmus, and a Senate Committee is now in session for that purpose, not, it is stated, with the idea of discovering any hidden sensations, but that Congress may have an intelligent understanding of the entire situation before enacting further legislation. Secretary Taft has already appeared before this Committee. and has described the duties of the different officials and employees, so that an orderly presentation of the facts may be secured. Mr. Bigelow is among the witnesses to be heard. The fact that Mr. Bigelow's entire stay on the Isthmus was but little over a day, and the further fact that his information was largely derived from two men who have, or think they have, personal grievances against the Canal authorities, have been widely regarded by the press of the country as conclusive evidence of the total lack of any attempt at serious investigation on his part, especially as both facts are kept out of sight very carefully in his article. It is now perfectly obvious that, as we intimated last week was probably the case, Mr. Bigelow studiously avoided making any inquiry from responsible authorities at Colon (the only point he visited), and was interested only in describ-

ing existing defects there without regard to the question whether they were being remedied or what was being done else-Secretary Taft unequivocally denies the charges that appointments are controlled by political influence, that negroes have been brought from the West Indies under a promise of \$1.50 gold a day to receive only half that sum, that incompetent white foremen are being substituted for competent negroes: shows that many other apparently specific allegations of incompetence and mismanagement are based on a misunderstanding or partial statement of facts; and characterizes as too contemptible for answer the charge that the members of the Advisory Board of Engineers avoided on their visit the line of the Canal because they feared yellow fever. The astounding assertion that the Canal Commission had brought women of bad character to the Isthmus was, in a second statement from Mr. Taft, shown to be totally baseless. The Commission's agent, Mr. Settoon, reports that in selecting 283 out of 1,500 women who wished to go from Martinique to the Isthmus, every one accepted was required to identify herself as wife, daughter, or sister of an employee already on the Isthmus, and her claims carefully verified by reference to the list of laborers who had been sent from Martinique to the Canal Zone. Mr. Settoon adds that hostile criticism on this matter was foreseen, and every conceivable precaution taken to forestall it. That such an abominable accusation should be made without a particle of supporting evidence is enough to characterize a critic as outrageously reckless and unworthy of credence.

ക

The Agitation Against Corrupt Practices

The effect of the insurance investigation is shown in the bills and resolutions already introduced into the two legislative chambers of New York State. These measures may be divided into two classes: those which concern the business of insurance; and those which concern the use of money for political purposes. Those bills which are designed solely to modify the insurance laws are at best defective,

for the Legislature has not yet had a chance to consider the findings of the Investigating Committee. The other measures, however, having nothing to do with a technical matter, such as insurance is, cannot be regarded as prematurely introduced. One such bill provides that every political committee shall have a treasurer, and keep accounts of the money it receives and expends; that it shall file such accounts with the State: that no corporation shall contribute for the success or defeat of any candidate or proposition; that upon petition to certain courts a summary investigation shall be instituted; that if a candidate be found guilty of corrupt practices he shall, if successful in the election, forfeit his office, and, whether successful or not, shall be disqualified from holding any public office or position of trust for five years; and that, if the candidate be one for a legislative position, the decision shall be forwarded to the legislative body, and shall be prima facie evidence of the facts. Another such bill provides in greater detail for the prevention of corporations from contributing, directly or indirectly, to any political organization or candidate; it provides that any corporation violating this mandate against making such contributions shall forfeit its charter; that any officer, stockholder, or agent who aids or advises the violation of this mandate shall be subject to imprisonment and fine and to disqualification from employment by any corporation for five years; but that any such person testifying to such violation shall be exempt from penalty. It seems almost certain that public sentiment in . the State will effectively demand of the Legislature at its present session a practicable and radical corrupt practices act.

A Move for Municipal Freedom

The United Cities Conference was the name assumed by the delegates who met in Chicago last week at the call of the Municipal Voters' League of that city to consider the relation of National and municipal politics. The invitations were limited to the non-partisan organizations that take a direct part in municipal elections. Among the

organizations represented were the Citizens' Union of New York, the City Party of Philadelphia, the Citizens' Municipal Party of Cincinnati, and the Voters' Leagues in cities like Denver, Minneapolis, and Buffalo. Sixteen cities were represented at the Conference by delegates. Some differences of opinion developed over such subjects as the initiative, the referendum, and the recall, but upon the matter which the gathering was called to discuss there was practical unanimity. The resolutions adopted declare that "the intrusion of National politics in municipal government brings with it issues absolutely foreign to the proper functions and reasonable aspirations of the National parties, and others which are alien to the interests of the municipalities, thereby tending to degrade the National parties and seriously injure city government." The specific recommendations, adopted by unanimous vote, are:

1. That cities should be granted the largest possible measure of home rule, subject only to such general statutory safeguards and restrictions as may be necessary to protect the general interests of the State as distinguished from the local interests of the municipality.

2. That the party column on the ballot should be abolished; that the names of candidates for a single office should be printed on the ballot under the designation of that office, and that it should be made impossible to vote a straight party ticket by a single

mark or cross.

3. That municipal nominations and elections should be completely separated from State and National nominations and elections, and should occur at different times, and that nominations for all municipal offices be made by petition or by an efficient method of direct primaries.

4. That the number of elective municipal officers should be reduced as far as practicable, always preserving the right to elect members of the municipal legislative body

or city council.

5. That the merit principle should be applied to all departments of city administration under practical and efficient civil service laws.

In the reports from the cities represented and in the discussion that preceded the adoption of the resolutions all the speakers agreed that the two greatest obstacles to permanent municipal betterment were the intrusion into municipal politics of National partisanship and the malign influence of special interests, chief of which are the public service corporations. Mayor Jones, of Minneapolis, told the Conference that much improvement had been wrought in Minnesota politics by the use there for several years past of one of the features recommended in the resolutions, namely, an arrangement of the ballot under which it is made impossible to vote a straight party ticket by a single mark or cross.

A Legal Adviser to a Judge

Judge Grosscup, of the Federal Court, Chicago, has taken a rather extraordinary step in appointing John Maynard Harlan as his special legal adviser

in connection with the receivership of the Union Traction Company of Chicago. Mr. Harlan was the Republican candidate for Mayor a year ago against Judge Dunne, and for years has been actively identified with public affairs in Chicago. He was at one time an Alderman, and as such gave considerable attention to the street railway question, being chairman of a committee appointed to report on the subject. Judge Grosscup, in appointing Mr. Harlan, said:

From the beginning of the Union Traction receivership I have recognized that the receivership represented in reality five interests-the interests of the bondholders, the interests of the original underlying com-panies, the interests of the North and West Side companies, the interests of the Union Traction Company, and the interests of the public—and that the interests of each of these were in some respect in conflict with the interests of each of the others.

As Judge Grosscup pointed out, the pendency of negotiations between the companies and the city for a settlement of the outstanding differences has created a conflict. The Transportation Committee of the Council represents the public, "but it represents the public at arm's length to the companies;" the representatives of the companies represent the companies, but "at arm's length to the city;" and between them the court must act as an impartial arbiter bound alike to do justice to both, but without a legal adviser. Upon reflection, Judge Grosscup declared it seemed that it were well to have at this time such an adviser, and that Mr. Harlan was, in his judgment, in a most favorable position to fill

Digitized by GOOGIC

that place: "He is a public-spirited citizen; he is an excellent lawyer. citizen and as lawyer he has given the subject considerable consideration. He has stood for a settlement that would be just and which will give to the people of Chicago the quickest good service, and would also in the quickest practicable time give to them the opportunity of actual municipal ownership. It is understood, of course, that Mr. Harlan's service as such adviser will not in any way limit or restrain his freedom of opinion and action regarding the extension of ordinances as they should be submitted by the Council to the vote of the people." In commenting on this appointment Mayor Dunne said: "It seems to me to be unique in judicial history that a Federal judge should desire a legal ad-While Mr. Harlan is amply equipped through knowledge of the traction question in Chicago to act as adviser, yet it is a novel precedent to set in the courts to have a judge select men to tell him what the law is. I have absolutely no objection to Mr. Harlan, who. is an able lawyer and who has studied civic conditions. He will give good advice; but I cannot understand why Judge Grosscup needed a special legal adviser." We believe that this action is without precedent; but it appears to The Outlook to be an excellent precedent to be followed in other cases. Why should not a judge who has special duties of a complicated nature to perform in addition to his regular work avail himself of especially competent aid in performing them?

That the negroes The Economic Future of the South are of the Negro facing a future of grave uncertainty is the only conclusion which can be drawn from a discussion which took place at the recent annual meeting of the Economic Association at Baltimore. This uncertainty is not due to the causes which have brought misfortune upon the colored race in the past so much as to the possibility of the introduction of competition, from which the negroes in the past have largely been For three hours a crowded audience, dotted here and there by a dark

face, gave close attention to this subject as it was presented by Dr. Du Bois, of Atlanta University, Mr. Alfred H. Stone, of Mississippi, and others. Comparisons were drawn between the work of different classes of negroes, and also between the negroes and those white immigrants who, having turned southward, are competing with them in raising Especially telling were the figcotton. ures showing the greater industry, thrift, and stability of Italian workers as compared with the blacks. Although the economic future of the colored people is hung with dark clouds, Dr. Du Bois saw light for his race in such work as has been carried on in Lowndes County, There, where land has been sold to colored people, over seventy men have emerged from an ignorant and shiftless population to a position of independence. Such a success, which has been attained elsewhere as well, shows what may be accomplished in rural communities if colored men are guided by wiser heads than their own. Mr. Stone, who is a young and enthusiastic cotton-planter of Mississippi, and a level-headed student not only of Southern history, but also of the present labor conditions in the South, is a believer in the possibility of a stable economic condition among the colored people. He employs only colored laborers, and he believes that, if properly trained and guided, they can hold their own in competition with white immigrants. His facts and figures, however, show how intimate must be the union between moral and economic salvation. "Unstable as water, thou shalt not excel," he quotes as the summing up of his observation of the negro race. It is true that a large proportion of the colored people are succeeding better than the white man knows, because they are serving those of their own color; yet the millions who lag behind, and who are in danger of being overcome by the incoming tide of foreigners, owe their unhappy condition not so much to their inferiority to the white man as to their inferiority to the most moral, industrious, and stable of their own race. If their economic condition is to be improved, there must be first developed

in them those qualities which command success among any people, but lacking which there is no promise for a bright, industrious future.

The elections for the British The British Parliament, which are in **Elections** full tide this week, opened very dramatically last Saturday at Lancaster, which has been for many years the home of free-trade principles. Balfour, the former Prime Minister, and the leader of the Unionist party, ran as Conservative candidate from the east division of Manchester, where his former majority was 2,453. To the great surprise of England and to the consternation of the Conservatives, he was defeated by a comparatively uninfluential Liberal and free-trader, Mr. T. G. Horridge, by a majority of 1,980. London at first refused to believe the news from Manchester, where Mr. Balfour's great personal popularity seemed to insure the safety of his seat; but it has been shown more than once that London, like Washington, is the last place in the country in which to detect currents of public opinion. In another division of Manchester Mr. Winston Spencer Churchill turned a Conservative majority at the last election of 1,471 into a Liberal majority of 1,241. The five Manchester seats in Parliament, which have been held by an aggregate Unionist majority of 7,321, now represent an aggregate Liberal majority of 11,111. It has long been a tradition in the middle counties that as Lancaster goes so goes England; but it remains to be seen whether that prediction will now hold true. The Liberals are jubilant; the Conservatives are in consternation and do not know what to expect. There are, however, 670 seats to be filled in the new Parliament which will meet at Westminster on February 15. Last Saturday sixty-six of these seats were filled by the election of thirty-nine Liberals, fourteen Unionists, six Labor candidates, and seven Nationalists, the Liberals making a gain of twentytwo seats in thirty-nine constituencies. The Liberals have a majority in the House of Commons of about a hundred to overcome, and the situation would

have been hopeless if what is called a political landslide had not taken place. If the indications of popular feeling afforded by the early elections are to be trusted, the Liberals in the next House will have a good working majority over both Conservatives and Nationalists, and will go into power after a victory even more overwhelming than that which was gained by Mr. Gladstone in 1880. It is quite clear that the Conservative endeavor to make the election turn on the Home Rule question has disastrously failed; the English people are voting this week on the question of free trade against protection.

On Sunday and Monday The Moroccan of this week, at Algeciras, Conference Spain, a point directly across the bay from Gibraltar, there arrived many of the principal delegates to the international Moroccan Confer-The Spaniards and Moors who make up the population packed the quays to witness the debarkation of those who came by sea, especially of Mohammed el Torres, the Moroccan Minister of Foreign Affairs, who was accompanied by a party of no less than sixty persons, all garbed in Alowing white robes and wearing white and red turbans. Owing to the presence of many squadrons in Gibraltar Bay, the town of Gibraltar was also another center of activity. American bluejackets were conspicuous in the streets, where they fraternized with the British sailors. Rear-Admiral Sigsbee and the captains of the American squadrons have already been the recipients of many courtesies, among them a dinner given by Admiral Sir Edward Chichester, the commandant of the naval establishment. The American representatives at the Moroccan Conference are Mr. White, our Ambassador at Rome, and Mr. Gummeré, our Minister at Tangier. The nations chiefly interested are France and Germany, M. Revoil, formerly Governor-General of Algiers, being at the head of the French, and Count von Tattenbach-Askhold, lately special German Commissioner to Morocco, at the head of the German delegation. The importance of Morocco to France lies largely in its propinquity.

The fact that there is a long boundary line between Algiers, a French possession, and Morocco, naturally gives to France under any circumstances a special interest in whatever takes place across the frontier. It has been difficult to maintain peaceful commercial intercourse between the two countries; for, to this end, it is absolutely necessary that the caravan routes be kept open, and the various tribes in the mountains of Morocco are perpetually blocking these routes and even invading Algiers.

(2)

For many years competent The Future observers have argued that of Morocco Morocco could not continue much longer to exist in a state of The civilization which has barbarism. transformed Algiers and Tunis from barbarism to law and order and to material prosperity is the nearest of all civilizations to give to Morocco like benefits. Hence, the interest which France takes in protecting her Algerian territory from predatory raids by Moroccan tribes, and in keeping trade routes open, is doubly justified in the eyes of the world when one considers how France has transformed that part of North Africa in which she has been working. time ago France entered into an agreement with England by which, in return for certain favors, England definitely acknowledged the propriety of France's special influence in Morocco. Later, Spain did the same. Although the German Government was well aware of the agreements, it made no protests for many months, when suddenly the German Emperor took advantage of a Mediterranean journey to touch at Tangier, and there publicly to question the right of any nation to exercise special influence in Morocco. A long series of negotiations between France and Germany then followed, of which the Algeciras Conference is now the culmination. The position of France and of all the nations represented at the Conference is that the commercial and political integrity of Morocco shall be upheld. Any difference of opinion arises largely from the questions of an international police and an international disposition of the tax

collections. On these points of dispute the American representatives will not vote, unless and until they have received special instructions from home. They will be powerless to commit this country to any policy with regard to disputed questions; their presence can be justified only as an effort to secure by moral influence a friendly settlement of differences.

The strained relations be-

France and tween President Castro, of Venezuela Venezuela, and the French Government last week reached a serious crisis, and although the Venezuelan chargé d'affaires at Paris did not receive his passports as was expected, still in every other respect diplomatic relations between the two countries have been discontinued. The despatches from Paris assert that there is no intention on the part of the French Government to make a naval demonstration in Venezuelan waters, but that France is fully determined to have its demands considered seriously and formally. There is no sign whatever of friction between France and the United States with regard to the former country's relations to Venezuela, and it is certain that whatever France may do in this matter will be submitted to our Government for approval before final action. It will be remembered that the demands of France are based upon an award of \$685,000 to French claimants and credit-France abstained from the international blockade of Venezuelan ports in which England, Germany, and Italy joined. The French claims, amounting to nearly \$8,000,000, were submitted to the adjudication of an umpire appointed by President Roosevelt. The reduction of the \$8,000,000 of claims to \$685,000 was considered so favorable to Venezuela that every common-sense motive seemed to prompt an early and friendly settlement by President Castro. But, following his usual course of delay, obstruction, and international contumacy, Castro has ignored his duty in this respect, and has pushed the friendly feelings which France had for his country to their limit and beyond what patience and forbearance require. attempt last year to annul the concession

of the French Cable Company added to the unpleasantness of the relations between the two countries, and for some time France has not had a Minister at Caracas, but has put its interests in the hands of M. Taigny, whose authority as chargé d'affaires Castro has positively refused to recognize, asserting that M. Taigny was personally unacceptable to him. The whole affair is characteristic of the irascible and arbitrary temper of Castro, but it is probable that when he is pushed to a positive decision as to a definite rupture with France he will accept the inevitable ungracefully, as he has done before in similar cases. Another report of interest from Caracas is that the United States, through its Minister, Mr. Russell, has chosen in the asphalt complications a single case for the determination of American rights namely, the Critchfield claim, which involves no charge on the part of Venezuela that the company concerned had abetted the revolution, as is alleged of the New York and Bermudez Asphalt Company. It is said that the Critchfield Company invested a large sum in a railway and in the asphalt business under an agreement that they were to be exempt from certain taxes, and that a year ago what amounted to a prohibitory tax was placed on the Company's business by President Castro, in violation of the agreement.

68

As yet, there is of Russian Finance course no possibility for a large, long-time, low-interest loan to Russia, such as was requested early last autumn from the combined resources of Germany, France, England, and America. Nor is there possibility even for a smaller loan at four per cent. and at former quotations. Indeed, the Russian Government has done wonderfully well in obtaining any additional cash credits. It accomplished this result last week, not once, but twice. In Berlin the bankers, after long negotiation, finally consented to the renewal of the Russian Treasury bills, which mature in Germany next month. In Paris the bankers, after equally long negotiation (France already holds two billion dollars'

worth of Russian bonds), finally consented to advance a short-time loan of about \$50,000,000, at a net cost, so it is announced, of six per cent., to the State Bank of Russia, pending the time when the Government can contract a regular loan. Such credits placed by one State Bank at the disposal of another are not infrequent. With these successes the Russian Finance Minister's assurance in submitting his budget to the Council of the Empire last week must have been considerably strengthened. As he pointed out, the enormous deficit of 480,000,000 rubles (\$240,000,000) was due to the noninclusion of some of the Japanese war expense in the estimates of the previous report. The Minister frankly admitted that Russian finance had been rudely shaken both by the war and by the internal upheaval, but confidence would be restored, he believed, when the disorders ended. For expenses in connection with the Duma a credit of \$900,000 was assigned; a peculiarly interesting feature of the report was the statement that this would be the last budget to be submitted solely to the Council, as the Duma, or Parliament, would be hereafter empowered to co-operate in examining it. The fourth noteworthy event in what seems the most notable week for over a twelvemonth in Russian finance was the Government's authorization to the State Bank to issue another \$75,000,000 worth of notes.

Financial Betterment After action, reacand Political Reaction tion? Is that to be always the rule in Russia? At all events, the news of the Government's financial betterment last week created surprise, disheartenment, and even consternation, not only among Russian revolutionists, but even among many Moderate and Liberal reformers, who, equally ardent in the desire for constitutional government, would seek it by methods only of law and order. The opinion seems now general that only necessity will force autocracy's hand; that when there is no necessity a policy of reaction is to be feared. Count Witte, the financial genius who has triumphantly brought his country through other crises, is now, as

Premier, the present Finance Minister's chief, and not improbably dictated that Minister's policy. Now that the country has quieted down somewhat after the Moscow excesses, and revolutionary leaders are openly deprecating any further risings until the people are better organized, the Prime Minister evidently feels surer of his ground. In November the zemstvoists, the leaders of the district and provincial assemblies, were informed that the now historic Imperial manifesto of October 30 in no wise restricted the Duma's eventual functions. Many persons thereupon fancied that the manifesto implied the ultimate elaboration of a constitution by the nation's representatives; indeed, Count Witte himself was reported as saying, "If any one shall rise in the Duma and propose a constitution, I will support him." This report has not been contradicted, so far as we know. November was a stormy month for the new Russian Government and for Count Witte, the first Russian Prime Minister. The revolutionists had to be conciliated if possible, but, at all events, as the history of the following month showed, the Government's first duty was to maintain order. It would seem, however, that in January the revolutionists may be defied by an increasingly strong Government, if we may judge from an article in the "Novoe Vremya," which proclaims, on the Premier's behalf, not only that the manifesto in no case affects the autocracy's status, but that the Duma will be dissolved if it attempts to meddle with the Empire's fundamental laws. Furthermore, the same journal declares for Count Witte that he reckons on the Manchurian army to apply the final quietus to the revolt. The date of the army's return, it adds, will mark country's complete pacification. Count Witte has made an admirably courageous and deservedly successful stand against the combined forces and intrigues of the court, church, army, and bureaucratic circles. He has in great measure well fulfilled his duty, with the rough tools at his command, of preserving law and order throughout the Empire. He is too astute a statesman, we believe, to punish one revolution by provoking another. But the cause for that

other would certainly be found in any withdrawal, and perhaps even in a threat to withdraw, any part of the Emperor's grants in his October manifesto—the Russian Magna Charta.

•

Copies of the "North The Chincse China Daily News" and Awakening the "South China Daily Journal" containing comment on recent disorders in China have now reached this country, and offer the opportunity to Americans of considering more fully the Chinese side of the various questions at issue. Concerning the affair at the Mixed Court, which has jurisdiction over the foreign settlement at Shanghai, involving the imprisonment of some Chinese in the municipal jail instead of the Chinese prison, a letter in the "South China Daily Journal " says:

It is natural for the foreign resident to ask why the Chinese community should create such hubbub over what seems to the English press an affair of minor significance... The Chinese are angry because the British Assessor, ignoring the Mixed Court regulations, ... insisted on executing rules proposed by the Consuls-General, which rules have never been sanctioned by the Chinese Government.

In the "North China Daily News" a "foreign resident" (who, we have since learned, was the only foreigner openly to espouse the Chinese cause) declares that Chinese opinion, official and mercantile, considers that this alleged denial of justice was distinctly not in accordance with the treaty rights of the Chinese in Shanghai, an opinion upheld by the Taotai or Governor in a recent speech to the heads of various Chinese guilds:

I must apologize to you all for not having managed foreign affairs in the past with sufficient firmness, thus resulting in the disgraceful trampling on our rights that was witnessed at the Mixed Court. Be assured that I will exert my utmost to erase the shame inflicted on the Chinese Government and the people by the action of the British Assessor and the municipal police.

Deep-seated hostility is again manifest in China towards foreigners. It was first shown against Americans on account of the unjust application of our Exclusion Act. So far from the boycott

Digitized by GOOGLE

of American goods being ended, it continues seriously to affect American trade in the Yangtse and Canton regions. Chinese newspapers now advocate the boycott of Indian opium because of the act of the British Assessor at Shanghai. Another result of the present movement is seen in the official discouragement of concession-hunting by foreigners. The aggressive spirit of the Chinese has been increased by the successful maneuvers of the Chinese Northern Army, and by the return from Japan of many Chinese jingo students. Hence the proposed withdrawal of the remaining international troops from China has been meeting with increasing opposition from the Powers.

Dr. George Ernest Mor-China for the rison, the accomplished Chinese correspondent of the London "Times" in China, and one of the representatives of the "Times" at Portsmouth, addresses in his letters not only the readers of that paper who are British subjects, but a world-audience. His letters always find appreciation among those who care for the intimate knowledge which may be expected from one who has repeatedly crossed China on foot and horseback during the past dozen years. He has now returned to China from England. He finds evidences of a remarkable change—nothing else or less than the awakening of a genuinely national Chinese spirit. First among the causes of this awakening is Japan's victory over Russia. Indeed, it is difficult for any of us to overestimate the moral effect of the defeat of the great land power of the West by the rising sea power of the East. A second cause is found in the reaffirmation and strengthening of the Anglo-Japanese alliance, guaranteeing the integrity of Chinese territory, come what may. A third reason, in Dr. Morrison's opinion, is to be found in "the impolitic action of the United States, which, failing to perceive that the recent boycott was merely one manifestation of a general anti-foreign policy, has adopted an attitude of conciliation which Asiatics naturally misconstrue" (we suppose Dr. Morrison would add, "as a confession of weakness"); but there is more to be said on this point at another time. A fourth-reason for the greater resistance to for-eign aggression is seen in the presence again in China of large numbers of half-educated students, who have returned from Tokyo with the somewhat vainglorious idea that China is capable forth-with of following Japan's example in dealing with the rest of the world. Dr. Morrison's final reason for the change in national spirit is found in the withdrawal of the British-China squadron and the reduction of foreign garrisons in the metropolitan province of Chili.

As the causes for the change The Results of the Chinese towards for-· eigners are five in number, so the practical results are also fivefold. First, the provincial authorities, with the aid of Japanese instructors, have made a great effort to bring Chinese military forces into a state of efficiency. Secondly, there is the determination to grant no further railway or commercial concessions to foreigners, and, so far as possible (as in the case of the Canton-Hankau Railway) to revoke existing concessions, this being sometimes accompanied by rather chaotic proposals for undertaking railway and mining enterprises under the auspices of the provincial officials and gentry, most of these people, according to Dr. Morrison, being of a corrupt type. A further result of the growing. restlessness may be seen in the circulation of a mischievous anti-foreign literature, similar to that with which the boycott movement was organized last May. A fourth result is to be found in the persistent agitation by the native press and in public meetings for the fuller assertion of China's sovereign rights against foreign aggression; this includes, of course, the abolition of foreigners' extraterritorial privileges, and, as illustration, Dr. Morrison points out the Shanghai Mixed Court incident (referred to in a preceding paragraph), incident which would be only locally important were it not one of the manifestations of a general policy. Finally, the Treaty Revision Commissioners, "at no time disposed towards

facilitating commercial relations," are now "openly obstructing all further development of commercial relations" between China and the rest of the world. Dr. Morrison warns England and the other commercial Powers that united action must promptly be taken to point out to the central Government at Peking and to the provincial viceroys the inevitable consequences of their encouragement of present tendencies. It is true that, since Japan's triumph over Russia, and since the guarantee of Chinese integrity by the Anglo-Japanese Treaty, the ancient spirit of evasion, delay, and passive obstruction, characteristic of some Oriental dealings, has in a marked degree given place to a franker, bolder, and more aggressive spirit of deliberate and organized resistance to foreign influ-It is natural that this should be so, and we should welcome any robust display of normal nationalism.

€

Recent information which The Famine has reached us about the in Japan famine in the northern provinces of Japan shows that the calamity is the greatest that has happened to that section of the country for the last sixty years. So appalling are the conditions that the committee chosen by the foreign community of Sendai declare that out of a population of 899,279 at least 280,000 people are in extreme distress, "with no possibility of saving life without aid." Three provinces are involved in the distress—those of Miyagi, Fukushima, and Iwate. The immediate cause of the famine is the failure of the rice crop; and how complete this failure has been is shown by the fact that in-Miyagi alone the yield of rice this year is less than twelve per cent. of the normal amount. One of the newspapers in this province says: "The sentence of death has been passed on the people of this province;" and the statements of the committee are so worded as to show that there is little exaggeration in this pitiful declaration. In Fukushima some 300,000 people are already in distress, and in Iwate, the least afflicted of the three provinces, it is said to be certain that 100,000 people cannot live without

speedy and continued aid. Throughout the famine-stricken territory many thousands of men, women, and children have been reduced to eating the bark of trees, shrubs, and roots. In a far less devastating and deplorable famine which took place in Japan a few years ago aid was extended cordially and generously by many foreigners living in Japan, and it is not too much to expect that the present crisis will call out similar help. The facts we have quoted are all taken from an appeal issued, not by Japanese, but by foreign residents in the afflicted provinces who are in sympathy with the people and with the authorities. American member of the foreign committee of relief is Mr. J. H. De Forest, of Sendai, Japan, and any contributions sent to him directly or to any of the foreign papers published in Japan will be promptly and carefully administered. should be added that the Japanese Government has opened public works for the employment of the poor, and has issued provincial bonds to meet the emergency, while generous gifts have been made by the Japanese themselves all through the Empire. There remains, however, a very wide margin of suffering to which the generosity of sympathetic people the world over may well be applied.

•

Perhaps the strangest and The Dewey most picturesque craft that en Route ever sailed the seas since the beginning of navigation is now breasting the billows of the Atlantic on its long voyage from the United States nearly half-way round the globe to Manila. is the gigantic floating dry-dock Dewey, which started on its voyage of 10,500 miles a fortnight ago to America's possessions in the Orient, and will make, if it meets the expectations of its builders, only about one hundred miles a day. A week or more ago it had reached the Bermudas and is now slowly making its way across the Atlantic to the Straits of Gibraltar, going by way of the Mediterranean and the Suez Canal. It is expected to reach the Philippines in about three and a half months from the time of starting, if everything goes as planned. A few facts and figures about this strange craft will reveal its magnitude and give an idea about the greatest towing enterprise ever undertaken. The Dewey is an immense box of steel 500 feet long, 134 feet wide, and 42 feet above the sea. Its bottom rests upon great square tanks eighteen feet deep, and its side walls, including the parts above and below water, are sixty-four feet high. When its tanks are pumped out, the great machine, the most stupendous ever constructed for any navy, not only raises itself above the waves, but is capable of lifting high and dry above the waters not only the heaviest of our great war-ships, but also the heaviest yet planned for any navy in the world, for it has a lifting capacity of twenty thousand tons. By means of its construction it is not only able to lower its floor to scoop up the mightiest battle-ship and lift it above the sea, but it also is able to dock itself. Here. however, its powers end. It has not been possible to devise a rudder vast enough to steer such a craft, and hence it has to be towed. Three great naval colliers, the Glacier, Brutus, and Cæsar, each equipped with a wireless telegraph plant by means of which they can communicate with each other and the crew of the Dewey itself, have it in tow, and the tow-line is a mile and a half long. being made of manila hawsers twisted together and terminating in steel cables. The great length of the tow-line was made necessary to meet the heave of the sea, especially during a West Indian hurricane or an East Indian monsoon, while the pneumatic cushions by which the cables are attached to the convoys break the force of sudden strains. enterprise of constructing such a vast machine and towing it to the Philippines is a great one, and involves a large expense, the dock itself costing a million and a quarter dollars, while the expense of towing it will add greatly to its ultimate When it arrives safely at Manila. bowever, the United States will be placed upon an equality with Japan and Great Britain as respects docking facilities. In times of peace the dry-docks at Shanghai and Hongkong are, of course, open to American ships; in time of war these would be neutralized, and thus, in case of a war between the United States

and any other power, its navy in the Orient would be placed at a great disadvantage.

Principal Fairbairn's
Lectures
The third series of the Deems lectures (founded by the late Dr. Charles F. Deems) has just been

late Dr. Charles F. Deems) has just been given under the auspices of the New York University, by Dr. A. M. Fairbairn, of Mansfield College, Oxford, to large audiences, mainly of clergymen, upon "The Religion of Jesus Christ." may be regarded as a continuation of the work on "The Philosophy of the Christian Religion," reviewed at length in The Outlook of September 20, 1902, and was largely devoted to literary criticism of the primitive documents in which the historical ground of the religion is It was unfortunate, said Dr. Fairbairn, that an anti-Christian animus largely colored the beginnings of New Testament criticism, yet criticism properly applied and understood was a thoroughly conservative force. It shows, he said, that most of the documents, and all of the most important, date within a period of eighty years from the death of Jesus, while the oldest of them, from the pen of Paul, is not later than twenty years after that event. "How did so extraordinary an evolution of thought take place within so short a period?" Literary criticism alone lays a sure foundation for historical criticism. Pauline Epistles, earliest of the primitive documents, exhibit the same evangelical tradition that was subsequently embodied in the historical Gospels. "The Synoptic Gospels and the Acts use the language which the Pauline Epistles had naturalized; we could not have the former without the latter." On the other hand, it was demonstrable that the former had not been modified by the latter. The ground here taken is substantially the same as in "The Philosophy of Religion," and is sufficiently con-The discussion, necessarily close, was punctuated with antithesis and spiced with epigram in Dr. Fairbairn's characteristic style, with constant enlivenment in pointed remarks by the way, as in objecting to painting the Ten Commandments on the wall of Christian

churches-just what the emancipated Hebrew serfs needed, but Christians need more than such negatives. portrait drawn of St. Paul finely exemplified the legitimate use of historical imagination. Dr. Fairbairn has a happy way of refreshing the close attention he requires with personal reminiscence and anecdote; e.g., Tholuck, visiting Scotland and discovering that the kippered herring which regaled him meant preserved herring, amazed and amused the Scots by praying that Thomas Chalmers might long be "kippered to the Church of Scotland." If at times Dr. Fairbairn seems to dogmatize, he tells us, "My pupils have taught me how to handle the New Testament," and declares that at the heart of dogmatism is a lurking skepticism. For lack of time large portions of the manuscript had to be left unread. It is probable that the whole will in course of time go to form another massive work. The concluding lecture, which reaches the heart of the subject, is entitled "The Religion and its Formative Ideas."

William Rainey Harper

It is given to few men to achieve so much in so brief a space as William Rainey Harper achieved in a lifetime of less than half a century. Born in 1856. graduated at fourteen, receiving a doctor's degree from Yale University at nineteen, Professor of Hebrew at twentythree, President of Chicago University at thirty-five, he died at the age of forty-nine, having in his fourteen years of administration put that University in the front ranks of the universities. A scholar whose learning in his special department gave him the respect of scholars. a teacher whose capacity to arouse enthusiasm was such that he was said to have made Hebrew at Yale as popular as football, an extraordinary reader of men, so that in an unprecedentedly brief time he gathered about him a brilliant and powerful faculty, an executive to whose sagacious energy Chicago University is a splendid monument, an administrator from whose instinctive observation and unfailing memory no detail escaped perception and recording, we believe that his greatest and most permanent influence is due to an idealism with which he was credited only by those who had watched his work most closely and studied him most intimately. It was this idealism that enabled him to create a new type of university.

The distinctive characteristic of the English university is culture. Itself the product of a splendid aristocracy, it in turn produces the world's finest aristo-Its product is the English gentle-The distinctive characteristic of the German university is scholarship. Growing up in an atmosphere of erudition, it in turn produces the erudite student. Its product is the German scholar. These two types of university, coming across the ocean, have here been nat-The older college, formed on uralized. the model of the English university, and primarily classical and literary, produced the gentleman—an American gentleman. Its aim was culture. The newer college, formed on the model of the German university, and primarily technical even in its classical and literary work, produces the scholar-an American scholar. Its aim has been scholarship. The difference between the old and the new has been a difference not merely in curriculum and method, but in unconscious aim and spirit. President Harper in Chicago University has given the world a new type, because a type animated by a different spirit and proposing to itself a different aim. If we may define the spirit of the English university by the word culture and that of the German university by the word scholarship, we may define that of the new type that President Harper has given to the world by the word service.

If all readers were careful, which they are not, it would hardly be necessary to say that the difference which we here note is relative, not absolute, a difference not of essence but of emphasis. The older college of the English type produces scholars. The newer college of the German type produces gentlemen; and doubt less the Chicago University has produced both scholars and gentlemen. But the

unconscious emphasis of the first has been on quiet culture, of the second on zestful investigation, of the third on preparation for an active American life. The scholarship which the first has regarded as a means and measure of self-development, and the second as an end in itself, the third has regarded as an equipment for service.

This spirit of service is here too sharply differentiated from that of other and older institutions of learning, for accuracy of definition is never possible in the spiritual realm; but it is the emphasis which Chicago University has put upon this spirit in its organization and administration that has given to that University its peculiar history and its distinctive features. An institution to equip men for service belonged not in an academic town; rather in a great commercial metropolis, and in such a metropolis in the middle West. location was fitly chosen. Equipment for service appealed to men to whom mere culture and mere scholarship made no appeal, and so brought to Mr. Harper the financial partners whose generous co-operation has given the University its endowment; and never, we suppose, in academic history has so large an endowment been given in so brief a time. Equipment for service led to the organization of a course of study continuous throughout the year, with liberty to pupils to come and go, taking their instruction in fragments as best they could. ment for service inspired it to develop a university extension scheme and to form affiliations with sister and smaller institutions, so extending its organic influence into other communities and through other States. This spirit of equipment for service has inspired it with a more than intellectual devotion, has imparted to it an atmosphere of absolute intellectual freedom, has bestowed upon it high ethical standards, pre-eminently so on all sociological topics, and has preserved it from the perils which otherwise might endanger an institution organized in a commercial city and directed to practical ends in a commercial community. last, but not least, this spirit of equipment for service has been caught by other and older institutions, from which the new institution has inherited traditions of culture and of scholarship, and to which it has given in exchange a spirit of direct and immediate serviceableness.

Dr. Harper was a greater man than his generation realized. Doubtless he had the defects of his qualities; but the qualities will be remembered long after the defects are forgotten. To the future he will appear great, not merely for his scholarship, his teaching enthusiasm, his mastery of detail, his indomitable energy; he will be recognized as one who felt. America's need of a new type of university, not to supplant but to supplement other types, and as one who, with the vision to see, had also the power to realize. The future, which he has himself helped to educate, will see that he was the founder, not of a commercial college nor of a technical school, but of an American university. It will see that he was an educational seer and an educational pioneer. And some appreciating friend will build for him the one monument he would desire above all others, by putting in the center of the University campus the college cathedral which it was his ambition to erect there, to symbolize and to nourish that spiritual life which he sought to make the inspiration and the glory of the University, as equipment for service was its dominating purpose.

Such a soul cannot die; death has no dominion over it. Alfred Tennyson has written its biography:

"Life piled on life Were all too little."

Jonathan Edwards has interpreted its spirit: "To live with all my might while I do live." When death sent a message before to say, "I am coming," he altered not one whit his life. He neither defied death as an enemy that he hated, nor welcomed it joyously as a friend that summoned him to rest from his labors. He counted death as an insignificant incident, and with unabated devotion to his fellows and his God he continued his service to the end. Then, when death opened the door, he walked calmly through, from life to life.

The influence of his last days gave a sacred radiance to the funeral services. on Sunday afternoon at the University. They were not a requiem for the dead,

but a commemoration of the living. The fitly chosen words of interpretation and of appreciation spoken by three of his intimate friends were characterized by a simplicity, sincerity, and vision which made those present realize the spirit of the risen leader and forget his broken and tenantless house, and inspired them with hopeful aspiration and strong resolve to live their lives in service as unselfish and in faith as strong as his.

Captious Opposition

It is always a misfortune when there is not a well-organized and watchful opposition to an administration or a dominant party. It has been the misfortune of the Republican party and of the country that for years it has fought a divided party, without consistent leadership in Congress along lines of principle, but simply captious and irritating. A real opposition must be based on general policy; it is always short-sighted to endeavor to harass and embarrass an administration which cannot be successfully opposed along broad lines. The measures with which President Roosevelt is identified are of great importance, and ought to be subjected to the most searching criticism. Such questions as the building of the Canal, the regulation of railway rates, the administration of affairs in the Philippines, the relation of the United States to the South American Governments, afford ample ground for wide divergences of opinion. is plenty of material for an intelligent, statesmanlike opposition to the policy of the Administration and criticism of that policy; but there is no room in an intelligent, capable body of men for an attempt to defeat the measures which represent the policy of the President and to break his popularity by harassing, irritating, and insincere criticism and action. There is evidence that this is the attitude of a considerable body of men in the United States Senate; if so, the sooner the country understands the situation the better. Mr. Roosevelt is not infallible; any measures which he urges on Congress are properly within the scope of the most searching criticism and the sharpest antagonism; but to attempt to break his authority by a combination of the politicians of both parties is not a procedure which will command the respect of the country, or which can be safely proceeded in.

The Senate especially is in no position to take this attitude toward the President, for the country is quite aware of the steady encroachment of the Senate on the other departments of the Government during the past fifteen years. It has seen the declining energy and power of the House of Representatives as a result of those encroachments. It has more than once witnessed the attempt of the Senate to exercise the functions of the Executive. It is gradually coming to understand the persistent policy of the Senate over a long period of years which has practically made it a dictating body in the matter of appointments instead of a confirming body. Any attempt to delay the making of the Panama Canal will not be regarded by the country with any degree of patience. It is a great public need. The people of the United States are behind it. The President's method of dealing with a problem which is very complicated and difficult ought to be examined and questioned, but any captious attempt to delay or defeat the Canal because of jealousy of the President's popularity and the desire to humiliate him will certainly react disastrously on the men of either party who indorse or connive in such a policy. It will be not only unpatriotic, but it will be in the last degree shortsighted. And it must be added in all frankness that the United States Senate, with its recent record and its present membership, is not in a position to break the influence and the authority of the President of the United States. integrity, truthfulness, and courage are just now, in a critical period in our moral history, a possession of immense value to the country. Nothing could be more short-sighted than a persistent attempt to undermine his influence as a man and to diminish his authority as a President. Let his policies be subjected to the sharpest criticism and his measures met by the boldest opposition, but the country will not tolerate any intrigue

Ų,

or connivance on the part of a group of politicians to break the force of a personality whose movements they cannot control for their own ends, and who has gone to his present position and secured his present popularity because he seems to the people of the country so unlike, in spirit, character, and method, most of the men who are opposing him.

Half a Loaf

The Consular bill, recently outlined in The Outlook, has been favorably reported by the Senate Committee on Foreign Relations. But in what shape?

The measure, as reported, provides for a grading of consuls-general and consuls. The bill makes seven classes of consulsgeneral, at salaries ranging from \$12,000 for London and Paris down to \$3,000 for the lowest grade; it makes ten classes of consuls, at salaries ranging from \$8,000 at Liverpool to \$2,000 for consulates of the lowest grade. Under such a system men would be appointed as consuls of a particular class instead of as consuls to a particular place. At present some of our consuls are not suited to the places in which their consulates are located, but they are suited to other places; again, some consuls are capable of better work than is required in their. present positions; finally, it has been almost impossible to get good men to serve in certain posts of danger, as in the fever-ridden tropical ports, for instance, yet those are the very places where the highest order of talent may be necessary, for they are often centers of revolution. Under the service by classes we have a right to expect that the Government will (1) secure good material for these "bad" places, and will in any event (2) assign consuls to stations where they will be of greatest benefit, just as army and navy officers are assigned.

Though Secretary Root has declared that "the importance of an inspection service hardly needs demonstration," we venture to reiterate that under the present system the State Department is quite unable in very many instances to ascertain whether a consul is doing his duty faithfully and efficiently. In the reported bill, therefore, as in the original, it is a satisfaction to find provision made that "each consular office shall be inspected at least once in two years." duty five inspectors are to be appointed by the President from members of the consular force; they are to be known as consuls-general-at-large, and are to receive salaries of \$5,000 each. They are to inspect consulates just as National banks are inspected by bank examiners, and to be put in charge of consulates which are going wrong just as bank examiners are put in charge of banks which go wrong.

As reorganization of the consular service on the lines of classification and inspection is essential, for whatever there is of committee approval of the original measure let us be truly thankful. if this is the cheering part, the rest is disappointing and disheartening. cording to the bill as presented to the committee, original appointments were to be made only to the lowest grades and upon examination, the examination to be conducted by a board of three persons, one to be an examiner designated by the Civil Service Commission, one the Chief of the Consular Bureau, and the third an officer in the State Department chosen by the President. Whenever a vacancy should occur in the lowest two classes of consuls, the Secretary of State was to require the board to examine such applicants as the President should designate. After the President had designated the applicants, the board, as soon as possible, was to hold an examination and certify to the Secretary of State the names of the applicants who had passed. All Senators cling more or less closely to their prerogatives of patronage. Hence the provision for examination was struck out. Incredible as it may seem to some, the Senators have spurned the application of the merit system in appointments. Not only do they want appointments made according to the present spoils system, but apparently they would discard promotion as well, for they have also struck out the original bill's provision authorizing the President to designate men to fill vacancies as consul-general

or consul above class No. 6 from the class next below. Now, these features of examination and promotion are even more vital to consular reform than are the features of classification and inspection. Chiefly because we have, as a rule. sent as consuls to South America, for instance, not persons examined as to character, ability, and experience, but mere spoilsmen—those unfamiliar with languages and with peculiar commercial and political conditions—the exploitation of South America's possibilities in trade and transportation has been almost entirely pre-empted by English and German capital. It naturally follows, then, that whatever South America needs in imports is mostly supplied by those two Powers, England and Germany, which have been developing her resources.

Some weeks ago the New York Board of Trade and Transportation proposed to organize a National consular reform convention. This proposal might well be carried out to show Congressmen what Boards of Trade and Chambers of Commerce think. But the consular service benefits not only these organizations; it ultimately benefits every American citizen. It is of direct import to the Californian wood-cutter, for example, that his forests should furnish the wood for railway cars in Argentina and not the resources of that Power which controls Argentinian transportation. It is of direct importance to all our citizens that our exports shall be increased and that our interests abroad, whether of promotion or protection, shall be intelligently watched. To do this we must increase our consular efficiency by some such reasonable and conservative measure as that presented to the committee; civil service reformers would have gladly seen it more radical.

Of course, if the consular bill passes in its present shape, President Roosevelt can carry out the provisions of the original bill by Executive Order, but that will do nothing permanently to improve the service. Mr. Roosevelt's successor will be free to make appointments in the bad old way. To prevent this, citizens generally should make their Congressmen understand that the people will not rest content until the full measure of

reform called for by the original bill has been secured from Congress. Half a loaf should be welcomed as better than no bread, it is true. But when one should and can get more, why be pacified with half a loaf?

The Spectator

The Spectator has always longed to be a hero. Not a real hero, be it understood, but a hero in a book. It is not the hero's looks, nor his inexhaustible savoir-faire, nor even his luck with women, that rouses envy; it is his knack. The subtlety of his every-day methods puts the Spectator's utmost finesse to shame. Why, there was a hero once who could throw into a flutter of his finger-tips what costs most men labored speech. No need for him to say, "James, me coat!" With a slight gesture he could summon anything, from a policeman to iced drinks. "I made almost imperceptible gesture of remonstrance," he writes in a letter, "to vouchsafe apologetically, 'If it affords you any comfort, yes!" Remonstrance, apology, comfort—all in a wave of the hand! The Spectator believes that, if he took it into his head, that hero could indicate by a slight gesture that he wanted one to take the cube root, square it, and multiply by one hundred and forty-nine. Note what a variety of things he contrives to command by the same signal. "I signed to Margaret," the hero records at different places in the book, "and she

at once { left the room." blew out the candles." fetched pen and ink."

Now, when the Spectator signs to Margaret, she just says, "Henry, dear, what is the matter? You know you are not good-looking enough to make faces!" As for slight gestures, he tried them, all kinds, at breakfast the other morning, his modest object being toast. Had the hero put forth a tenth of that muscular exertion, he would have got fall de foie gras, or grilled bones at the very least. But nobody offered the Spectator a thing, though they all stopped breakfast-

ing and regarded him with pained surprise. The Spectator had to invent a joke on the spot to cover his confusion.

● .

It must be that people devote a good deal of time to observing the hero, for he never appears to experience the slightest difficulty in conveying intelligence by a look. When he opens his morning paper, every one is instantly aware from his face that King Edward has been assassinated. Now, whatever may be his expressiveness of feature—and the Spectator does not question that it is phenomenal—he could not do this unless some one were attending. When his look conveys to his sweetheart the fact that he has a rope-ladder in his waistcoat pocket, does not at least half the credit belong to the lady?

6

The Spectator points this out to his spouse when she complains that he is blunt. "Were you more keenly alive to changes in my countenance, my dear," he suggests mildly, "there would be no need of bluntness." The Spectator faithfully tried the hero's delicate speech-without-words during his courtship. For more than one evening he sat by Her side, to outward seeming tongue-tied, but all the while throwing into his burning glances thoughts that lay too deep for tears. And she? she was embroidering at the time, and occasionally making disjointed observations, and the Spectator thought he saw a stifled yawn swelling her throat. Against such crass insensibility as this what chance have subtle methods?

3

That hero has the eye of an eagle. He can see more on a dark night than the Spectator can in broad daylight. There was a moon, to be sure, that time he caught the flash of a stolen diamond at a hundred paces; but it will be remembered that the night was thick and the rain heavy when he detected Claribel escaping over the garden wall in the scullery-maid's bonnet and shawl. And then he sees so much more than meets the eye. The Spectator is inclined to think that the hero can tell from one

glance into the brown eyes of a dog the whole history of its master's past life. The Spectator can usually tell himself when Bruno has been stealing chops; but then Bruno is singularly bad at hiding his sins. But he has never assisted his master, or anybody else, to run down an evil-doer, and strangers' dogs do that sort of thing for the hero every little while. When the Spectator has anything serious to conceal, he proposes to converse with the mind-reading hero only by telephone. And even then his voice may betray him; for the hero's ears are as quick as his eyes. If he has once met you, there is no hoodwinking He knows your voice and your him. step, and the step of your horse, and the step of your sister's cat. More than that, he knows the creak of your boots when they are on another man's feet.

(6)

There's one thing that puzzles the Spectator. How can a man like this, a man who, when shown a cake of soap, knows instantly that it was last used to lave the hands of Mary Andersonhow, I say, can such a man fall into the egregious blunders he does? Perhaps he feels bound to give readers a good run for their money. But when the Spectator hears Sherlock Holmes saying, after the hundredth demonstration that his friend Dr. Watson is the very king-pin of incompetents, "My dear Watson, I hope you can come with me to investigate this case. It means a great deal to me, having some one on whom I can rely "-why, then he wonders.

@

It may be that for these gifts of nature the hero deserves no credit. But there are directions in which he displays pure skill. Consider how he can turn a conversation. The company is speaking of starfish, perhaps, and the starfish is for him an awkward subject just then, or he has deep reasons for wishing to shift to wireless telegraphy. Does he crash rudely in, as the Spectator would, with, "Apropos of nothing at all—?" Mark his methods. He modulates that conversation with as much science as a musician leading a motif through a series of keys. Starfish, crawling things; crawling

things, fright; fright, telegrams; telegrams, wireless—and there you are. Nothing could be neater. But the Spectator notes that no one interrupts the hero with freezing looks and, "As we were saying—" Could the hero even turn Margaret when she is bent on a picture hat?

6

It is little short of marvelous the success the hero has in screwing facts out of people. When he wants to know anything, he just strolls across the street and engages somebody's coachman in conversation, and it all comes out. Spectator has tried this sort of thing himself, with indifferent results. Engaging people in conversation seems for him to have two sides. The people engaged don't, figuratively speaking, "give down" as they ought. Once when he tried to talk with a washerwoman about her mistress, she suddenly set her reddened arms akimbo and drawled expressively, "Aw, say now, ain't you the gawlly article?" Nobody ever treats the hero to language like that I

The hero displays an enviable ability to get along and be cheerful under difficulties. Catastrophes that would break another man pass over him without destroying either his courage or his health. He can go off to the heart of British Guiana without a cent beyond his passage money, and live there in absolute secrecy for three years or more, and not once need to call upon his bankers. Usually he starts out with a tooth-brush and the clothes he stands in, but, no matter what he goes through, those clothes are always good enough to propose to the woman he loves in, when he gets back. The Spectator wishes he knew the hero's tailor.

☻

Of the Spectator people demand that he shall not bore them with repetitiousness any more than is needful. All his small cherished habits are stigmatized as nervous tricks, of which he ought to break himself. No such burden is laid on the hero. He is permitted to employ the Homeric method—the polyphlosbeosing sea, once polyphlosbeosing, always

polyphlosbeosing. If the hero twirls his mustache on the first page, you recognize him in future by the twirl; it is his trade-mark. If he begins by smoking cigarettes, he does nothing but light them, and wave them about, and flick off ash, and reach for fresh ones, to the end of the chapter. This is a rôle the Spectator is not permitted to play. If, for instance, he should take to "tapping with one nervous forefinger" on all the tables in his own and other people's houses, as the hero does, he wouldn't have a friend in the world.

•

But, then, the hero is a privileged character. People will let him tell them in prolix detail about things they must have known before he was born. The Spectator suspects this is not good for him, and he is always glad when the heroine gives the egoist a dose of his own medicine. "George," she cooes, "I don't suppose you've thought of it from that day to this, but once you saved me from a blazing building. Three steps at a time you dashed up the stair and bore me fainting in your arms—" Conscious of having set her the example, the hero cannot resent this sort of thing. stands it in silence. A rare silence, be it said. For when the mood of loquacity is on him there is nothing the hero won't Even the family skeletons are dragged from their closets and paraded in the public eye. "My father was a political shyster," says he, with engaging frankness, "and my mother was at one time a professional shoplifter." No one appears to think any the worse of him for these disclosures. It makes the Spectator wonder whether he could afford to make public the most devious ramifications of his own ancestral tree. Lacking the hero's artful way of putting things, he doubts the prudence of such a step.

There is one more thing that must be mentioned, one more art of the hero's, which the Spectator has tried most vigorously to acquire. It would be so effective when one wanted to express indomitable will. How does the hero "square his jaw"?

AN IMPORTANT FRANKLIN DISCOVERY

BY MARY CAROLINE CRAWFORD

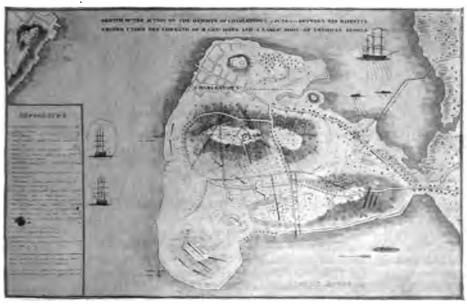

THE bicentennial anniversary of the birth of Benjamin Franklin renders of special interest a very valuable collection of Franklin manuscripts—including original writings heretofore unknown, household accounts, court invitations, and samples of work done at Passy on the printing-press Franklin had there set up for the entertainment of his grandson, Benjamin Franklin Bache—which, by a curious accident, has recently come into the possession of the University of Pennsylvania.

Benjamin Franklin Bache, it would appear, had carefully cherished these manuscripts. For it was through George Fox, his executor, that they have been preserved all these years. George Fox left them to his children, and one of these, Mary, when clearing out a garret, came upon several barrels full of old papers which she proposed to send to a paper-mill. Her neighbors, however,

interfered. Remembering that Fox was connected with the Franklin estate, they urged her to go through the papers before disposing of them as so much waste. This she did, with the result that manuscripts of exceeding value have been unearthed.

The letters in this collection, as well as many pamphlets and other documents, appear to have been part of the material brought back by Franklin upon his return from France in 1785; but the collection also contains letters, pamphlets, and papers belonging to both earlier and-later periods, and a carefully cherished map of Bunker Hill which must peculiarly interest students of American history and of Franklin's character.

Inasmuch as it seemed particularly fitting for the University of Pennsylvania to possess some memorial, that should be valuable historically, of him who was distinctly its founder, an effort was made,

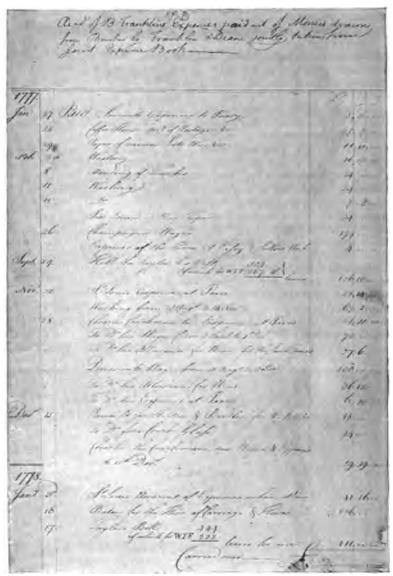

MAP OF THE BATTLE OF BUNKER HILL Owned and long preserved by Franklin

when it was ascertained through Dr. S. Weir Mitchell that the collection could be purchased, to raise among friends the to historical students. amount of money necessary to its acqui-

rant the opinion that there is here considerable material of decided importance

An essay in Franklin's writing on

A PAGE FROM FRANKLIN'S HOUSEHOLD ACCOUNT WHILE AT PASSY

sition. This was successfully accomplished, and the mass of material was duly deposited in the University library.

Though no exhaustive examination of it has been made by the present writer, it has been looked over enough to war-

"The State of British Plantations in America," and Franklin's private expense account at Passy from January, 1783, to March, 1784, are of extraordinary interest. Some of the items in this record move one to smiles, notably "for washing from 25 August to 14 November, £67.5." Under date November 20, 1788, we find that Franklin "paid duties on 50 bottles of rum, £75." Another item is of £6 for sealing-wax which Franklin and John Adams used together.

Special interest attaches, of course, to specimens of work done on the printingpress set up by Franklin at Passy. An ode is one such specimen. Likewise interesting is the passport blank issued by Franklin, representing the United States in France, invitations sent out by the Doctor and received by him, and other things of the same kind. As was the fashion of the time, all these invitations were in writing, with the exception of those issued by Franklin himself, which were printed blanks in bold-faced type in the center of a large, cheaplooking sheet. In form as well they are curious, as witness:

Mrs. Adams' respectfull compliments to Dr. Franklin, is much obliged to him for the oil he was so kind as to send her, and is very sorry that his indisposition deprived her of the honoir of his company to dinner. Mrs. Adams takes the liberty of recommending a sedan chair by which the inconvenience of arising from a carriage might be avoided. Auteuil. December 3rd, 1784.

This offers certainly a quaint example of the stately courtesy which Abigail Smith, the daughter of a Weymouth, Massachusetts, parson, took on when she became the lady representative in France of the new Republic.

"Mr. Jackson," another card runs, "has the pleasure to send Dr. Franklyn a piece of elastich gum with a thousand good wishes and compliments."

Still another age-yellowed note presents "Miss Ralph's best respects. She with pleasure informs Dr. Franklin that her pappa, as the Doctor said yesterday, was out of danger, but he remains very low indeed; she is very sorry that she had not the pleasure of seeing Dr. Franklin, on Tuesday, but she having set up all night was obliged to go to bed in the morning, she desires her compliments to Mrs. Stepehenson Dec. 31, 1761."

A reminiscence of the Craven Street days is the following: "Mr. William Neale presents his compliments to Mr.

Benjn. Franklin and Mrs. Stevenson and will do himself the pleasure of sending his carriage to convey them to Richmond on Monday next. St. Mary's Hill, 27 June, 1765. The carriage will be at Craven street at any hour they shall appoint." Just here it is interesting to note that this Mrs. Stevenson (in whose household Franklin dwelt while in London) believed always in the nobility of the man. One letter from her in the collection under discussion tells her old friend all about her poor people in a way which shows clearly that Franklin had been a kind and practical helper in her ministrations to others. Her gratitude for this appears, too, when she, an old woman, in the face of approaching death, turns to him as her guide and consoler, "the best man she had ever known." She had wintered and summered him, as she says, in the Craven Street days, and "could not be deceived about his real character." It is worth while to recall this when Franklin is decried as a worldly-wise man. That he was many-sided is undeniable; but one side of him certainly was benevolence and wisdom.

Apparently he was looked on as a living encyclopædia by his correspondents. From France, from Germany, from Italy, came letters asking advice. Robespierre, then a young lawyer in Arras, sends to Franklin his brief of a law case in which he supported the efficacy of the lightning-rod, and asked for Franklin's opinion of its merit. How tremendously this discovery had stirred the people of Franklin's time is particularly well brought out in this letter. He who was to become famous through connection with the Commune was admitted to the bar in 1781; soon afterward he argued the question of the legality of lightning-rods, and published a report (without his name) called "Argument on Appeal from the Judgment of the Sheriffs of St. Omer." (The sheriffs, it appears, had ordered the destruction of a lightning-rod erected on his house.) This report was translated into both English and German, and a copy sent to Franklin, who no doubt annotated it himself before he returned it.

Here is a translation of the Robes-

pierre letter accompanying the report. It is now in the original French in the University of Pennsylvania collection:

Sir: A judgment rendered by the echevins of St. Omer, prohibiting the use of lightning rods, has afforded me the opportunity of pleading before the council of Artois the cause of a sublime discovery for which humankind is indebted to you. The desire to aid in uprooting the prejudices opposed to its progress in our province, led me to have printed the argument which I made in this matter.

I venture to hope, sir, that you will deign to receive kindly a copy of this work, the object of which was to induce my fellow citizens to accept one of your benefactions. Happy to have been able to be of service to my region in determining its highest magistrates to receive this important discovery, happier still if I can add to this advantage the honor of securing the patronage of a man whose least merit it is to be the most illustrious savant of the world, I have the honor to be with respect, sir, Your very humble and very obedient,

DE ROBESPIERRE,
Advocate to the Council of Artois, Arras, 1 October,
1783.

With still another distinguished man, no less a personage than Edmund Burke, Franklin is shown by these papers to have had an important correspondence about this time. In a very manly and beautiful letter dated "Charles street, Oct. 15, 1781," Burke begs Franklin's intercession, "not as the ambassador of America, but as Dr. Franklin, my friend, and the lover of his species," to the end that General Burgoyne be not returned to captivity in America.

"I have lately been informed with great certainty and with no less surprise," Burke writes, "that the Congress have made an application for the return of my friend, Gen. Burgoyne, to captivity in America, at a time when the exchange of almost all the rest of the convention officers has been completed. It is true that this requisition has been for the present withdrawn. But then it may be renewed at every instant."

That it was not renewed we may count, perhaps, Franklin's sign of reciprocation for the sincere esteem in which Burke evidently held him.

Turgot corresponds with Franklin about smoke prevention in these manuscripts, and others submit schemes on every imaginable subject—beg the Doctor to suggest topics for literary and scientific discussion, ask for offices for themselves and for their children, or inquire about friends and relations who have gone to America. Franklin, it would appear, preserved everything; frequently, too, he made characteristic indorsements of his replies to letters; he interpreted as well, by writing between the lines, Robert Morris's cipher; and on all public documents he made marginal notes that are exceedingly interesting to read to-day.

With Robert Morris and Robert R. Livingston there was constant correspondence, both personal and official, and even Franklin's great patience was frequently tried beyond silence, if we may judge from the indorsement, "Money, Money," written on a resolve of Congress

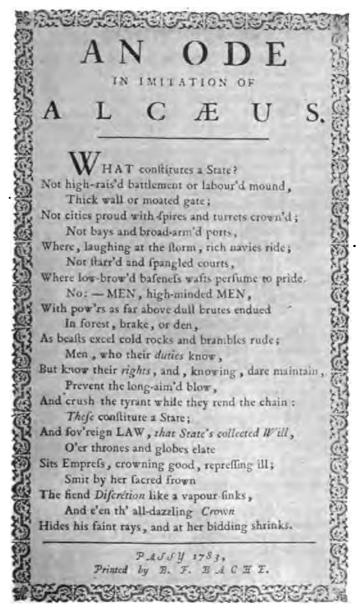

concerning expenditures.

The manuscript "Memorial of the State of the British Plantations" shows that Franklin had thought over the possibility of a separation from England as early as 1731, but in the fevered times of 1749 he would not utter a word, even in Germany, that would be considered treasonable. Franklin's copy of the draft of the first Constitution of Pennsylvania, with the indorsement, "to be sent to Dr. Franklin by the first post," is another interesting relic contained in this collection. In all, there are over five hundred pieces of manuscript, ranging from Franklin's own draft of the essay just mentioned down to his latest correspondence.

The letter of Ingenhous, Secretary of Catherine II., and physician to Marie Theresa, shows one of Franklin's means of influencing public opinion on the Continent. No subject which concerned anybody seemed to be foreign to his interest and his intellectual grasp. request of the German pastor Knoepfl for an American Lutheran church brings out prettily the friendly sentiment of German teachers and scholars for the second fatherland. The letters of English friends show what a strong current of sympathy there was among thoughtful people for the struggling colonies. The intercepted letter from Sir Henry Clinton shows the warnings that the British Government received from Americans. Numerous copies of letters sent by

Franklin are also here, as are the manuscript minutes of a court martial held on board of Paul Jones's ship, Bon Homme Richard—an investigation by

age of Addison, an age when style in composition was a subject of very careful thought, and "a perfect essay, a key to literary immortality." These manu-

ODE PRINTED ON THE PRESS SET UP AT PASSY BY FRANKLIN FOR HIS GRANDSON

which, it is interesting to note, the man whose bones have lately been brought to America was completely exonerated. Franklin grew up, of course, in the

scripts especially show the immense care which this literary man of the eighteenth century bestowed on all that left his hand.

THE CHURCH AND SOCIAL REFORM WORKERS

BY W. D. P. BLISS

THE American Institute of Social Service has been investigating the Church connections of the men and women engaged in constructive social reform work in the United States. Returns have been received and analyzed from over one thousand such persons. Of these, 401 were workers in associated charities, 339 were in settlements, 272 were connected with various National social reform organizations. All portions of the country were represented about in proportion to their activity in such reforms. Of the total number, 417 were men, 495 were women, the excess of women being in the associated charities and settlements. Among the other reform societies men were in the majority.

What is the result? Much has been said about the lack of interest and of participation on the part of the churches and even of church people in social reform, and yet here we have the result that out of 878 social reform workers reporting upon this point no less than 753 are returned as communicants in some church. Even if the 134 who did not report on this point be all counted as non-communicants, it still makes 753 out of 1,012, or 74 per cent. Surely, measured by this standard, church people, who are only about 25 per cent. of the community, are contributing far more than their share to social reform work.

This is so contrary to ideas much bruited in certain quarters that it becomes of interest to see how the returns were secured and whether they may be regarded as fairly reliable and representative.

The method was by sending blanks to the secretaries of all the associated charities in the United States, to the head workers in the settlements, and to the presidents or secretaries of National reform organizations. There was no picking or choosing; blanks were sent to all whose addresses could be secured. Each person to whom a blank was sent was requested to fill it out for individuals known personally to him or her as social reform workers. They were asked not to report the names of the individuals. so as to avoid seeming to pry into personalities or to be seeking information in regard to individuals. It was thought, too, that in this way more returns could be obtained. As a guarantee, however, of good faith, each one sending in a report was asked to sign his or her name to the statement that the returns did represent the facts as to workers in social reform personally known to the sender of the facts. To obviate reduplication, each was asked to report for individuals so intimately connected with the society or organization in question as not to be likely to be reported by any one else. One thousand and twelve such returns were made. It would seem, therefore, that here we have a considerable body of information at least fairly both reliable and typical.

It is indeed conceivable that persons friendly to the Church might be a little more likely to fill out such reports than others. Doubtless in the returns there are some errors and some reduplication, yet, making every allowance, the result seems to have been carefully obtained and to be entitled to considerable confidence.

What perhaps made the result even more surprising is the returns from the different classes of workers. Of those reporting on this point, the percentage of communicants among the associated charities rises to 92 per cent.; with the settlements it is 88 per cent.; among other reform organizations it falls to 71 per cent.

We have here, doubtless, indication of a tendency on the part of church people to prefer the more conservative methods of reform; yet even here we have the remarkable showing that 71

Digitized by Google

per cent. of the workers in the National reform societies who reported on this point were communicants, and 61 per cent. of the total number, counting all not reporting on this point as non-communicants.

What does this finding mean? It will be further elucidated as we consider further figures, but it may be said at once that it does not mean that there is therefore no basis for criticism of the Church. There is in the returns no slightest hint or indication of activity in social reform on the part of the churches themselves. was not the subject under investigation. Blanks were not sent to any institutional church, nor to any distinctively church organizations. It was taken for granted that workers in such societies would be affiliated with the church. If anything, the presence of such a large proportion of church people in societies distinctly extra-ecclesia would indicate that the Church herself was not doing such work. at least not sufficiently to furnish an adequate outlet for earnestness and We think no one can know effort. church and social conditions in the United States without believing that such is the case. At least in these returns the churches as institutions do not figure.

But what the returns do indicate is that a large and probably increasing number of, presumably, the younger and more earnest and active members of the churches are entering the social reform ranks. The larger number are doing so, certainly, in conservative ways. The difference between 92 per cent. of communicants in the associated charities and 71 per cent. among National reform societies is not a small one. Church people still prefer what the ardent social reformer would call "charity "in place of "justice." Nevertheless, it shows which way the wind is blowing. Complaint is raised in many quarters of the decreasing number of candidates for the sacred ministry; may it not be that in the large number of church men and women found in these social efforts there is one cause for this scarcity? The ministries of man they regard as truly sacred, as truly divine, as the ministries of religion. It is certainly evident that if the churches would retain their hold upon the earnest young men and women of our day, they themselves must enter the social field.

It is also clearly evidenced by the returns that religion and Christianity and the creed are not dying. It is a time of change, but the changes are modal and not of faith. Still, to-day, the majority of the men and women who are striving to make the world better—at least in the United States—are members of the Christian Church and believers in the Christian faith. Rather do we see to-day Christianity blossoming into a new life and the creed putting forth new credentials in the eyes of a practical world.

This becomes even more manifest as we note the denominational preferences of the social reform workers. churches that do social reform work are. naturally, the churches social reformers choose. Here the Protestant Episcopal Church is well in the lead. Of the social reform workers reported as communicants, the largest number, 163, or 21 per cent., are in the Protestant Episcopal Church. The Presbyterian and Congregational Churches come next, each with 132 communicants, or 16 per cent., although the fact that the latter of these two communions is much the smaller makes its 16 per cent, the more credit-The Methodist Church furnishes 111, or 14 per cent. The Baptists are 46, or 6 per cent. Unitarians and Universalists together number 48, or 6 per The Roman Catholic Church furnishes 40, or 5 per cent. Various other churches supply 83, or 10 per cent.

If we take the proportion of communicants in each religious communion to the total number of communicants in the United States, and compare this with the number of communicants the same communions furnish to social reform, we shall find that the Roman Catholic Church should produce 33 per cent. of the reform communicants, and does produce 5 per cent.; the Methodist Church (of all kinds) should produce 20 per cent., and does produce 14 per cent.; the Baptist Church should produce 17 per cent., and does produce 6 per cent.; the Presbyterian Church (North and South) should

produce 5 per cent., and does produce 16 per cent.; the Congregational Church should produce 2 per cent., and does produce 16 per cent.; the Protestant Episcopal Church should produce also 2 per cent., and does produce 21 per cent.; Unitarians and Universalists together should produce 0.4 per cent., and do produce 6 per cent.; other churches which should produce some 18 per cent. do produce 10 per cent.

These figures, however, must not be read without remembering that they are not in all respects equally fair to each The returns, it must be communion. remembered, are for purely extra-ecclesia work, and it is quite possible that the communicants of a given Church may not enter such activities exactly because so much on this line is being done within church limits. The Church of Rome, for example, more than any other, limits its activities to purely denominational institutions. In these returns the sister of charity and the lay brother have not been counted. By the same measure the Protestant Episcopal Church would stand even more to the front, since this communion, more than any other, has developed the institutional church and the church reform society, both of which are here ruled out. Other churches, too, have activities that here are not taken into large account. The Methodist churches figure largely in certain forms of prohibitory temperance work; the Presbyterian Church has recently made a new and commendable departure in a Labor Department of her Home Missions. Nevertheless, when all is said, these returns do furnish a rough and somewhat striking gauge of the extent to which the various churches are contributing to the social work for human betterment.

These communicants, too, are active communicants. Returns as to church attendance on the part of such workers show this. The average social reform worker, according to these returns, attends church 3.7 times per month. This, however, means little, because it lumps 814 church members who go to church on an average 4.3 times per month, and 120 non-church members who average

only .3 of 1 per cent., or 4 times per year. It is more important to know that there are 93 non-church members who do not go to church at all, and 37 nominal church members (many of them Unitarians or Universalists) who do not go at all, so that 130, or 12 per cent. of the whole number, are thoroughly unchurched. The remainder, however, seem unexpectedly regular at church, as the whole average attendance is 3.7 times per month. This, too, is throwing out 25 returns from individuals reporting an attendance on church of from 16 to 28 times per month, indicating that they represent practically, if not technically, church activities. Clearly the 814 church members engaged in social reform work have not left the church behind them. The Congregationalists report an average of 4.8 per month; Presbyterians, 4.7; Protestant Episcopalians, 4.5; Methodists, 4.4; scattered, 4.2; Roman Catholics, 3.5; Unitarians and Universalists, 2.8. It appears that among the church members in social reform the average attendance of the men is higher than that of the women by 4.4 to 4.1. Among earnest men, where the man is a church member, he is probably more faithful to his church than the earnest woman. The average attendance of church members on the associated charities is 4.2; in the settlements it is 4.4; in other reforms it is 3.9 per month.

Another set of returns shows the dominant early religious influences of the reform workers. Of the 980 reporting on this point, only 22 report no dominant early religious influence; 108 report the influence simply as Protestant, without naming any denomination; 872 report a denominational early influence. Comparing this with their present religious affiliations, we get some indication of the denominational changes that are taking place among this class of workers. The Baptist and Presbyterian Churches have neither gained nor lost. The Baptist Church was the early religious influence of 6 per cent. of those reporting this point, and is to-day the Church of 6 per cent. of the communicants reporting. The Presbyterian Church originally had and still to-day has 16 per cent, of those

reporting these points. The Roman Catholic Church, the Methodist, Unitarian, and Universalist, and the "scattered" Churches seem to have lost. The Roman Catholic Church, with originally 7 per cent., has now 5 per cent. of those reporting the points; the Methodist Church, with originally 15 per cent., has now 14 per cent. The Unitarian and Universalist Churches, with originally 7 per cent., have now 6 per cent.; while the *scattered " Churches, with originally 16 per cent., have now 10 per cent. The Protestant Episcopal Church and the Congregational Church have gained. The latter originally had 15 per cent. and now has 16 per cent.; the Protestant Episcopal Church, having originally also 15 per cent., now has 21 per cent. of those reporting.

So go the denominational changes, indicating, with what has gone before, that to-day it is not, on the whole, the churches most characterized by revivalistic methods, not the churches working on old personal lines, be these Roman Catholic or Liberal, that are reaching the earnest social workers. Personal religion means to-day the devotion of the person to the common effort. Still, as of old, the field is the world, and still, on the whole, it is Christian men and women, and, for the most, communicants in the Church, who are doing the world's work.

A JEWISH GIRL'S STRUGGLE TO RISE IN RUSSIA

[Told by a Zemstvo Official in Southern Russia and Written by Ernest Poole]

KNOCK at the open door of my office. I swung round in my chair impatiently, for I was absorbed in a Zemstvo problem. My glance was caught and held. The problem sank slowly from my mind.

In the doorway, hesitating, stood a slender girl with anxious, shining eyes and soft black hair that curled from under her old fur cap and nestled down to her shoulders. She wore a shabby school uniform—a loose brown belted dress which fell to her ankles. Her right arm was crooked up round a huge gray pack of school-books. The wrist and hand round the pack looked thin and white, but their clasp was strong. She did not lean sideways under the weight of the books, but stood tense. bending slightly forward. Only in the pallor of her narrow, olive face, in the drawn lines about her lips, in her heavy eyelids, you could read the truth anxiety, hunger, sleepless nights. Her big, resolute black eyes were scanning my face with such intense and eager hope that I felt suddenly searched through and through. I rose quickly.

"What can I do for you?"

"I want work." Her voice was very

low. Her eyes kept watching mine. "I'm a Jewess. I'm seventeen, and I've reached the last class in the Gymnasium. The Government hates Jews; they try always to weed us out of the schools at every examination. They tried hard with me, but even the Christian lady-teachers could find no fault. Every year they kept dropping other Jewish girls, but I always struggled through. So now in a few months I can finish.

"But now I can find no more work to get me money, and if I don't pay for the lectures to-morrow they'll expel me from And that isn't all. the Gymnasium. Jews aren't allowed to live in the town unless they belong to the Gymnasium or the University. So I'll be expelled from the town too, and sent into some ugly, lonely, dead little village way out on the steppe. I don't want to be! I want to stay here! I want to learn! I want to be a-" She broke off, looking down hard at the floor, her lips pressed tight. The arm round the books trembled. "I want work."

"Please take courage. We will do all we can. Leave your address here, and—"

Digitized by Google

"Leave my address?" She looked up in a flash of anger. "How many times do they say that all over the world? Leave my address! I tell you I must have work to-day!"

I began to walk up and down, racking my brain for some way to help her. I got an idea. Long ago, in a vacation month, I had worked hard collecting statistics among peasant villages. It was not Government work, but I decided now to let her compile these statistics for me. I turned and told her.

Her school-books crashed to the floor. She looked up, her lips half parted in an uncertain smile.

"Is this work for me—all—for me?"

"Yes. But it is very difficult. I'm

not yet sure you can do it."

"If you will only give me a chance!"
Her hand touched mine; her fingers were cold. "Just tell me all about it, and if I know that I can't do it, then I'll tell you, I promise I will! But if I think I can do it, then don't doubt me, don't change your mind, let me try!"

She drew closer and closer, her eyes never leaving mine, straining not to miss one jot of my meaning.

" Well?"

"I'm—I'm almost sure!" she cried. She kept staring at me, thinking intently. Suddenly she laughed—very low, but her eyes gleamed such keen enjoyment that I laughed too.

"How funny I must look!" she cried.

"Staring right at you like this! But wait." The smile vanished. "Just a minute more! Let me ask some questions." Her questions were swift and intelligent. As I answered one after the other, her face grew more and more triumphant.

"Yes!" she cried at last. "Now I understand it. You must let me try! You must!"

I still hesitated. She had so suddenly changed; the tragic figure of a moment before had become such a joyous young girl. "Don't forget," I warned her, "that the slightest mistake in your calculations may make all the work useless."

"Don't trouble! I tell you I understand. Yes! Yes!"

I watched her a moment longer. Then

I went to my desk and took out the mass of papers. She seized them joyously, she gathered all her scattered schoolbooks on the floor, and, kneeling down, tied my papers and her books together in swift jerks. Then she jumped up. I paid her half the money in advance.

She thanked me over and over again, her head bowed down, speaking unsteadily; then she turned and walked quickly out, holding the heavy pack before her in both arms.

Two months later, when my rush of work was over and my afternoons were free, I suddenly remembered my statistics. At once I grew anxious, for she had promised to complete the work in a month, and already two months had gone by. I had forgotten her address. I began to curse my softness in paying her ahead.

I went to the Gymnasium and inquired for a Jewess in the eighth class.

"What do you care about Jew girls?" asked the little lady teacher, sharply.

"This girl is doing work for me."

"H'm. Hope you didn't pay her ahead!"

"I did. The girl was poor."

"Oh, yes, all these Jews are poor! We have only one left—thank goodness—and she's not the one you want."

At last, from the janitor, I found the girl's address.

She lived in the poorest suburb. I could persuade no cabman to drive me out, for in that neglected quarter the roads were sloughs of mud with holes deep enough to smash any carriage. I got a market wagon and started that afternoon. For two hours we jolted and splashed and banged through the cold rain; every few minutes we had to jump out and pry the wheels up from the mudholes. At last we reached the house.

The colorless, ramshackle tenement looked doubly dreary in the darkening drizzle. The gaping, broken windows dripped cheerlessly. Only in one upper window a bright lamp was burning.

I climbed the steep stairs and knocked on the door. It was shoved open; from the low room came a puff of air so stifling hot that I drew back.

"What—what now?" A low voice

stammered. I turned. In the doorway a candle flickered, shaking up and down. It was held by an old man who wore a ragged gray gown and a red plush cap. From beneath the cap his coarse white locks of hair flowed down. In the yellow circle of light his long, bony face was full of shadows. A hooked nose, gray bushy brows, and deep-set, tired, frightened eyes. "What's now?" he stammered.

I asked for the school-girl Rachel.

"But what do you want with her?" He held the shaking candle close to my face.

"She was compiling statistics for me."

"Oh! You are Mr. B——!"

As he spoke my name, suddenly behind him rose a relieved hum of Yiddish voices, and in the dark room I saw shadows moving. Then out of the hum came a low, weak voice speaking in Russian.

"Oh, ask him to come in quickly."

A Jewish boy of fifteen came out. He wore a student's gray uniform; his dark, thin face was strong and intelligent, and his frank eyes at once reminded me of Rachel.

"My sister would like to talk with you." I followed him into the low, hot room and then round a screen. This place behind the screen was the bedroom for the family. Two large beds filled almost every foot of space. On one bed lay three wee children. And between their faces, from a deep hollow in the pillows, looked a face white, weak, but smiling happily. It was Rachel.

The three youngsters were breathing hard. It was plain they had been having a romp in the bed before I entered. Now they stared up solemnly, and I could not help smiling at those three unblinking stares. Rachel, too, turned her face toward them, and her eyes twinkled. She spoke caressingly in Yiddish to the children, and at her words they chuckled, though her voice was only a painful whisper.

"How on earth did you find me?" she asked.

I told her how I had gone to the school.

"That lady teacher," she smiled.
"Poor thing—she looked so sorry when

I came in that last day and paid my bill. I never saw her face look thinner. Then I began your work. I was at it hard every night, but just after I finished, two weeks ago, I got very sick. I think it is typhus."

"What does the doctor call it?"

The face turned weakly on the pillow and the eyes looked straight up at me,

laughing.

"You are so funny. You talk just as if Jews were the same as Christians. Just think of going to a doctor and saying: 'Sir! A Jewish girl with no money is sick five miles away in the mud.'" She closed her eyes. "Can't you see that doctor's face? Can't you hear him stamp and shout? Why, he would be the most shocked old Christian gentleman in Russia.

"So I've just been wondering how I could get well. You see, I'm not lonely. I have three very wonderful doctors here." She pinched the ear of one of the boys, who had been solemnly untwining a long, shining curl of her hair and stretching it out along the pillow. "But I can tell you I'm glad you've come. was getting frightened about your work. My father says I even sat up in my dreams and talked like an idiot. You see, my mind was so bad I couldn't remember your address. But how glad I am that you've come and made everything all right! The work is all done. If anything is wrong, of course I will fix Mother—please bring the work from mv desk."

I did not feel like examining it. I kept watching her face.

"Won't you let me send you a doctor?"

"No, thank you. I know I shall get well, anyway. Only—only if it's true that the money you gave me before was not all you wished to give, then can you give me the rest very soon?"

"Yes, certainly! I still owe you thirty rubles more [fifteen dollars]. I'll give it to you now."

"Thirty—rubles! Oh! But wait—perhaps the work is not done right."

"Then you can correct it when you get well."

She sank back into the pillows and closed her eyes. "Now I am happy. I

didn't think there was so much money left. I can save all that for my medical school."

"Thirty rubles? Medical school? What do you mean?"

"The medical school! That's what I have always worked for." She opened her big eyes, and they shone so brightly that for a moment all the weakness and disease seemed conquered. "I'm going to Petersburg! That's why I was so anxious to finish my school—to go to Petersburg to the big university for doctors. Ah, you think thirty rubles is nothing! But I'm sure it will start me." She eagerly rose on her elbow; her slender face flushed red. "You see, I have three girl friends there in the medical school, and one of them began with only twenty-four rubles. And I with thirty-why-why-" The flush suddenly left her cheeks, she sighed deeply and sank back unconscious.

At once the three doctors crawled up from the foot of the bed; they sat on the pillows and looked down at Rachel's closed eyes—chuckling with delight. Now and then they exchanged excited whispers in Yiddish. The youngest put his chubby fingers on her eyelids as though trying to look in behind, but the eldest sternly jerked the fingers away. Then they watched her face again.

"They are always with her," her brother whispered behind me. see, Rachel is so fond of these babies, she's so afraid they'll leave her alone, that she tells them not to be frightened by her fainting spells, because in such spells she flies off to fairyland. That's why they chuckle now. They wonder what part of fairyland she's in. When she comes to she will tell them. may think it's a bad thing to leave them with her always in the bed. But really they do her a lot of good; she's getting better every day."

Suddenly the eldest doctor, in a burst of glee and expectancy, did a fine somersault and struck the foot of the bed with a bang.

"No, no!" sobbed the mother, a white, stout old woman with a blue handker-chief over her head. "She will not get well. She fools you by always smiling, but under her smile are terrible things!

Often she cries and cries with her head on my knees. These last five years she had to fight every day and late every night to get money enough to go to school."

"Woe! woe!" groaned the thin old father. "When will this curse leave us?" He spoke huskily in slow, broken phrases. I began somehow to loathe him.

"This curse on the Jews—it jumps on our backs—on our backs when we are born—it hangs there always—hangs, hangs—till it drags us into the ground."

"How long have you lived here?"

"Better ask how many—how many places have we lived in?" His old head wearily nodded. "Hunt, hunt, hunt for a place to be safe and earn a living. Till five years ago we lived in villages, for there it is cheaper—yes, and safer too—but five years back our girl got so eager to learn that we came to this town. Here I have worked in the coal house. I worked hard. Look at my hands—no soft hands. All day I shovel the coal. My wife goes out scrubbing floors. We do all we can, but all we can do is to get food. We can't help our girl in her school. She must make all the fight herself. We cannot help, for besides food and rent and clothes we must pay more money-much more-to the police."

He drew closer, and I shrank in disgust, for he looked like a beaten slave. He put his hot, trembling hand to my ear and whispered:

"Money to let us live in the town. It is against the Russian law for Jews to live here unless they are students. Now, my old Rebecca and I—how can we be students? So we must bribe the police. More and more we must bribe. Else they will drive us far out on the steppe to a village."

"And my boy, too!" cried old Rebecca.
"The one that was here, the big boys always torment him in school; they jump on him from behind and grease his lips with pig's fat; they shout 'Jew! Jew! But he fights them off and tries to go on."

"And why are they all so cross—so cross with our boy?" cried the father. "Because they are stupid, all stupid, teachers too! And my boy is the first in

all their classes. Here, look—you can see his reports."

"And now," said the mother, "he is always eager to learn the violin, but they will not even let him go in the door of the music school."

Just then the driver of my wagon shouted up that he would wait no longer, so I gave the thirty rubles to the old man and went away.

At midnight in my room I spread out Rachel's work. I was delighted at first by the neatness of her figures. Then, as I examined closer, I was more and more amazed at the precision of all the tables. She had even exceeded my directions in places; she had improved the system I had suggested. I found not a single mistake, though I kept on reading till nearly daybreak.

To my mind came a picture of her face as I had seen it last—white, unconscious, but still half smiling, as though in a radiant dream:—"I am going to Petersburg."

Four years later, traveling on Zemstvo business, I stopped one night in a dull, lonely little town, and, my day's work over, I strolled to the town playhouse. There, over the weatherbeaten doors, a huge poster announced the performance of one of the old Russian tragedies. I bought a ticket and went in.

I looked about in amazement. Instead of the sprinkling of bored spectators you expect in such a place, I saw the narrow little house packed with eager faces.

The curtain rose slowly, creaking. The play began with all the pomp and ceremony, stiff gestures and stares, set speeches, loud voices, scant trees, and castles and armies—in short, all the clumsy levers that start off an old classic tragedy in a small provincial playhouse.

Then the heroine appeared.

Then the audience hardly breathed. The place was alive and thrilled with the voice of this woman; a voice now low and sad and sweet, now deep, impassioned, ringing; a dark, glowing face, with radiant eyes. And the audience, so long starved in the lonely, sordid town, was suddenly transformed. You could see them forget the dead street

outside, the petty homes, the yawns, cross words, and pious hypocrisies. They became real human beings who stared at this glorious woman on the stage, and wondered and thrilled and almost awakened.

Why was such a woman here? Wondering, and still under the spell of her acting long after the play was over, I strolled about the playhouse garden. At every table men and women sat over their tea and cigarettes, excitedly talking. Slowly the excitement died, the spell passed off, and the people went away—back to their old life as though nothing had happened.

All were gone. Only at one table a girl sat talking to a young, dark-faced boy. Half unconsciously, I kept glancing at her. An old blue cape was wrapped around her slight shoulders. She leaned across the small table, talking low. After a time she glanced up. I started.

The genius of an hour before! Here she was only a pale, dark girl, bright-eyed and feverish after the long strain of acting; her hair was in disheveled curls, her long, delicate fingers kept clasping the tea glass or playing with the boy's hands; now and then she laughed unsteadily; once she drew a deep, sudden breath of weariness.

The dark-eyed boy watched her anxiously, and every few minutes, when she shook with coughing, he leaned over and drew the cape tighter. I could hear his voice—steady, low, and soothing. His eyes never left hers,

But she could not relax.

Suddenly her eyes twinkled, and in that moment her face was familiar. She slowly rose as I came forward.

"You—are—" I stopped short.
"The Gymnasium girl!" she cried.
We talked long and excitedly.

"I tried and tried," she told me, "to go to that school in Petersburg. But you know their rules for Jews. First, we must pass the same examinations as the Christians, and then, from the Jews who have passed, they pick out only one in ten. I passed so high I won the gold medal. But even then I was refused admission. I can tell you I never slept at all that night.

"In the morning I had to think about earning money quickly. You see, my three little doctors were all beginning in school, and of course they needed help. And to work for them was just what I needed. It kept me from thinking."

"But how lucky!" I exclaimed. "How lucky, after all, that you missed the medical school! What a splendid career

you have!"

"Oh, how little you know of us Jews!" She smiled sadly. "Don't you know I'm forbidden to play in any but these lonely little theaters? I tried-I tried my best, and my friends all tried; they sent petitions to the Minister of Theaters again and again. But he always refused. How we used to wait and hope after each petition was sent! You see, once in a long, long time he does admit a Jew to the city theaters. But he is surrounded always by artists who spend all their time in intrigues and schemings for advancement. They are all afraid of any new artist. I understood at last that it was useless to ask him.

"For what can you do?" Her eyes grew feverish and her low voice grew passionate. "Just think of my brother the one who sat here a moment ago. Oh, the power he has if he could only have a chance! You remember in the Gymnasium he was at the head of his class. Well, he kept that place all through, and worked besides to support himself, and so at last he reached the University. But there he was refused. Why? Why?" She leaned far forward and her slender right hand gripped the edge of the table till the blue veins stood "Why? Because the University allows just three per cent. of its students to be Jews; this three per cent. was already filled, and so he simply struggled along with his violin, and now he travels with me. This waste! Oh, this terrible waste! When will it stop?"

She shook in a violent fit of coughing. At once her brother hurried back and wrapped the cape tighter round her shoulders; he spoke soothingly in Yiddish. As soon as she could stop coughing she glanced up into his anxious eyes with a quick, gay reply which made him laugh at once. Then she rose and bade me good-by, and walked away. She walked slowly. Her brother kept his arm tight round her.

I was busy the next two days in neighboring hamlets, but on the second evening I came again to the playhouse. It was empty. I learned that the Jewess and her troupe had been expelled from the town because Jews had no right to live there. The town people were most indignant and excited; dozens of petitions were sent to the police. But all in vain.

One evening six months later, back in my own town, I was walking home just before midnight. I walked fast, for the cold rain had been falling since morn-The trees were all dripping rivulets down on the dead autumn leaves The rain was changing to sleet. Even the breeze was heavy and lifeless. I shivered. In the distance, down the wide, muddy street, a few little taper lights began to flicker. They flickered larger, nearer, and became funeral lanterns carried by three women and some children. In front walked four men slowly, bearing a rough board coffin between them.

A peasant was passing, and stopped beside me under the tree. He was a huge old fellow, dressed in a long, stiff sheepskin coat, which rattled. Under his fur cap his wide sandy beard dripped with moisture. His small eyes peered out curiously.

"Who's dead?" I asked.

"Oh, it's a Jew funeral. You know, my barin, that old Jew who used to shovel coal by the railroad. Well, it's his daughter, the oldest one."

"Look here!" I seized his arm. "How do you know this is true? How do you know this is a Jewish funeral?"

"Oh, that's easy. Because these devils always carry their dead at midnight."

"What do you mean?" I was talking at random. I could not think clearly.

"Oh. barin!" The old man looked up, with a slow, shrewd grin. "Is it vodka you've been drinking, or what's the matter? Surely you know how these Jewish devils fear the bells of Holy Church in daylight. When the bells begin to ring in daylight, then, I can tell you, these Iews drop a dead body quick and run."

"Lies! lies! forever lies! When we've tormented these Jews to death, can't we even let them bury their dead in peace?"

"Oh, my good barin," the peasant grumbled. "Don't pinch my arm so tight. . . . Ah, here they come. . . . What can I do about it? Anyway, what difference does it make? If a body is not allowed to lie in holy ground, then it is damned no matter how fine the burial. Look there, you can see the old man's face already. His girl came home two weeks ago very thin and always coughing. So now comes the finish."

The little procession was passing close. In the yellow, flickering circles of light

you could see the faces of the three women and the little "doctors." All stared straight ahead. Only the children kept crying drearily—sleepless, dazed, frightened. The four men splashed slowly along through the mud; three of them looked down, carefully picking their steps; the fourth, a slender, darkfaced boy, gazed at the box so close that he stumbled. Suddenly the deep, rich tones of the church bell boomed the hour. At those slow, sepulchral tones the little children stopped crying and shivered.

The old peasant crossed himself reverently. "Christ save us!" he whispered.

A UNIVERSITY LABOR UNION

BY A. FITZGERALD IRVINE

CR fifteen or twenty years the Yale University Christian Association has carried on mission work at two points in the city of New Haven. One of these enterprises is in the region peopled largely by Roman Catholics. The other is in a Jewish center. The latter is a Sunday-school; the former is a mission.

The character of the Sunday evening meeting at the mission has been of such a nature for many years as generally to exclude the self-respecting artisans of the community. The audience for the last decade has been composed of the "bum" class. A dirty, sometimes drunken, always shiftless aggregation could be found there every Sunday evening of the coilege year. The policy of the mission was not so much the salvation of the "hoboes" as the social target practice of the students. Many efforts were made to move the point of emphasis, but not until within a year or so has much improvement been made. Those who endeavored to enlarge the scope of the work were met with the announcement that the primary aim was the "practice" of the students. that is changed now. The rounders are given a wide berth, and a new constituency enters as a result. The first result of the new régime is a fine men's club

under the leadership of Professor Emery. But, even with the enlargement of the mission idea, many undergraduates felt the need of something still larger. There is probably not a city of the size of New Haven in the United States where so little effort is exerted to reach the wage-earner.

The Yale Corporation and the Yale Faculty are well represented as bank directors and as leaders of corporations. The majority of them are allied in one way or another with capital.

It was urged that official Yale might in some way be identified with the toiling millions. A group of undergraduates met and studied the situation. They made a special study of the labor union, with the result that it was proposed to start one among themselves. Representative constitutions were procured and studied. Some of the underlying principles of the union movement were discussed at length and agreed upon as the basis of an organization.

The following sentences from the declaration of principles are characteristic:

We believe it inconsistent and unworthy that a wage-worker should take the benefits that accrue to his craft as a direct result of organization and at the same time hold himself aloof from the responsibilities and from his share of the expenses of that organization. We believe that union men, whenever possible, should demand the union label as a guarantee that the goods were manufactured under conditions fair to labor.

We believe that eight hours should constitute a day's work.

In the preamble we find this statement:

We do not look upon the labor union as an ultimate conception of labor, but we believe that whatever progress has been made in the lot of the laborer has been due wholly to the organization of the wage-workers.

It concludes with this paragraph:

Believing, therefore, in the cause of labor, and desiring to add according to our ability to the support of the union movement, we pledge ourselves to study it intelligently and to support it loyally.

The official name of the union is: "The University Federal Labor Union." The seal consists of the Yale seal surrounded by the name of the union. The membership is small. The members are selected as they are in the other college

societies. About a third of the members will go out with each graduating class. The work outlined for the union is the study at first hand of the movement, by actual contact. This will be accomplished by honorary memberships in the New Haven local unions. The members will write on labor themes for their degrees. They will invite prominent labor men from various parts of the country to deliver addresses. They will arrange inter-class debates on the subject and keep it before the student body.

Just what the attitude of the University leaders toward this extraordinary departure will be no one knows, but certain it is that there will be no opposition. Among the things planned for the present college term is a select labor library. R. C. Morse, Jr., the captain of the "Varsity" crew, is the president

of the new organization.

THE RELIGIOUS BELIEFS OF STUDENTS'

BY HENRY THOMAS COLESTOCK, PH.D.

Professor of History in Bucknell University, Lewisburg, Pennsylvania

O those who are facing the problem of reconstructing their religious opinions and beliefs I have one or two suggestions to offer.

You will be tempted to solve some of your religious perplexities by dismissing them. This is a dangerous attitude to encourage. For when once you have begun to solve your religious problems by evading them, you are taking the first steps toward religious indifference—a deadening condition to all future growth in the spiritual life. Shun indifference as you would shun the plague. Therefore, do not begin to solve your religious difficulties by refusing to think on them.

It is well that the unawakened can rest in their inherited religious beliefs and opinions. They fit, they satisfy. The soul is at rest. It does not question. Such persons conserve progress, but do not make progress. From one

¹ Substance of an address delivered in Bucknell Chapel, Sunday afternoon, May 28, 1905.

point of view they are to be envied. But upon the student is laid, whether he wills it or not, the responsibility of his opportunities and of his training. Upon him devolves the task of thinking, not for his less favored associates; his is the task to think before them. The thought that stirs his heart to-day will stir other hearts to-morrow; or it may be a year or a century must pass before the student's thought becomes the common property of community life.

But is not this the method of all progress?—the few become stirred, possessed by certain fundamental conceptions of life, of duty, of God, of destiny; they have caught a vision of things beyond their day and generation, and for this vision not infrequently they have to pay the dearest sacrifices human beings are ever called upon to make. But the joy of the vision makes the sacrifice seem small. Fortunate compensation!

By to-morrow or next century the new

Digitized by Google

idea becomes common property, and everybody believes it and gladly accepts it without question. Added light has come to all. The way by which it came has been forgotten. Why, we have always believed that I men carelessly say, little knowing the fierce struggle for its life through which that idea had to pass in its infancy.

For another reason of greater personal importance it is dangerous for you to evade thinking on religious topics. When the former belief begins to lose its earlier power of possessing us, we may be certain that it has served its purpose. It is losing its power over us because away down deep, unconsciously to ourselves it may be, another explanation of faith is beginning to form, and to push off the older, not unlike the way in which the autumn leaf is displaced.

Now, if, through any misunderstanding of the process that is going on in one's inner life, this loosening of beliefs is attributed to decay rather than to growth, and the individual seeks to arrest it, he is doing himself irreparable injury by suppressing the choicest fruitage of human culture.

If the inherited belief is losing its grip on our lives, the call has gone forth to develop a new one which will hold us with vital power. For it is not the beliefs we possess, but those that possess us, that transform our lives.

"Yes, but my thinking on religious questions has a tendency to lead to the acceptance of conclusions not held by my religious associates—the members of my church. The only way I can hold some of the doctrines of my church is by not thinking on them. Would you have me disturb my church relations? Should I remain a member of a church if I cannot accept its teachings?"

The answer to your question depends entirely upon the individual's point of view. If doctrine or explanations of faith be the fundamental element in the life of a church, you should believe what your church teaches, or find a church home where this is possible. Many persons hold that doctrine is the fundamental element, and change in their case is imperative.

But if explanations of faith be not the

central element; if faith itself is the basis of religious fellowship and its explanations are more or less personal matters bound to differ because of any one of a dozen reasons, especially with those who have been awakened to think for themselves, then differences in religious opinions need not disturb your church relations.

Indeed, denominational lines mean very little at the present time. When the clergy did all the thinking and solved all the problems, the line of cleavage between religious bodies was definite, well defined, easily discernible. The large part of the minister's function then was to establish his people firmly in sound doctrine—that of his own church. to-day the clergyman is only one of many who think on the problems of the religious life. In few churches is he followed implicitly as in former times. Some persons in nearly every congregation test the minister's message by the deliverances of their own mental processes. No longer is the message delivered from the pulpit accepted as proceeding from a final authority. More and more every man is becoming his own interpreter of his religious faith.

You should not hesitate, therefore, to think on the problems of the religious Be assured that the leaven of the newer thought is stirring within other hearts besides your own. Sooner or later you will discover them. By degrees the contagion spreads; the type of your church doctrine will be transformed. In your old age you will doubtless be a center of conservatism—the younger generation then pressing on into the next stage of progress. essential thing now is to understand your present relation to this general movement of reconstructing the religious opinions of the church. Upon you as a student is laid a responsibility; will you accept it or evade it? Will you accelerate or impede what seems to some of us to be a movement worthy of your most enthusiastic co-operation?

I have urged you to think on the problems of the religious life. Another suggestion I would have you keep in mind. In your consideration of these vital topics your idea of God will give color to all of your conclusions. The suggestion is this: In all your thoughts of God test your conception of him by what you know of Jesus Christ. For nothing is true of God which is not in accord with the spirit of Christ.

That God is like Jesus Christ sounds like a commonplace observation; in reality it is just the opposite; it is highly revolutionary. For the popular theology of to-day is based on the conception that God is unlike Jesus Christ; that God's attitude towards sinful humanity is one thing, while that of Christ is another. I cannot go into details, but a little reflection will enable you to understand what I mean.

In reconstructing your conception of God in view of the character and spirit of Christ, you will be doing consciously what many other persons are doing without realizing the nature of their act. Undoubtedly the great breaking away from the inherited beliefs of a former age, manifested in all religious bodies more or less, is due in large part to the very process I have indicated—looking at God through the character of Christ.

But have not religious teachers always looked at God in this way? I can only answer that the great systems of religious thought built up in previous periods of the history of the Church do not present any evidence of such an attitude. Indeed, these systems are monumental testimonies of the lack of such a process

of interpreting the attributes of deity. The explanation is not difficult. Each system of theology has been vitally influenced by the political theories of the times in which it took form. For the first time since the beginning of the development of systems of doctrine, the Christian Church is emancipated from the dominating power of authority. Religious freedom is one of the latest products of human progress. It is a goodly plant to look upon. While we must wait patiently for the harvest, the blossoms are refreshing and exhilarating to those who are able to interpret their promise.

Freedom to think on religious problems was necessary before a movement like the present could take form peaceably. A few centuries ago a movement similar to the one that is on now drenched all Europe in a Thirty Years' War. Do we value sufficiently the heritage into which we have come? One thing is certain: we cannot prize too highly our freedom to think on the most sacred questions of life and to embrace the conclusions reached.

Refuse, therefore, to bow before the authority of any system worked out in a previous age. With all humility, think upon the religious problems of life for yourself, and in your thinking keep in mind that in the character of Jesus Christ is the world's completest representation of God.

THE JOYOUS ROAD

BY PRISCILLA LEONARD

When we are happy—"Leave us, Lord," we cry,
"This one sweet hour, this one dear love or friend!"
When joy is shattered with a sudden end,
"Thy will be done!" our trembling accents sigh,
As though God's will were loss and agony,
As though His love had only griefs to send;
And in this prison-thought our souls are penned
Till we forget to look into God's sky
Where the warm sun and glorious stars are set,
Or see the happy flowering of His spring,
Or in the eyes we love His message given
Of love, hope, strength,—God's will, which men forget,
Working toward joys of which He is the King,
Half thwarted here, but wholly sure in heaven.

BLUFF KING HAL

BY H. ADDINGTON BRUCE

HAT manner of man was King Harry, Defender of the Faith, Liberator from the bonds of Rome? Many and diverse have been the answers to this question, keen the contention it has aroused. He has been pilloried as a monster of iniquity, the protagonist of merciless tyranny, brutality, and lust—the devil incarnate. Scholars of other mind have held him up to admiration as one of the truly great and noble figures of history, a genius of statecraft, who clearly discerned not merely the wishes but the needs of the English people, and with unfaltering enthusiasm and unparalleled ability proceeded to give form to the nebulous ideas and aspirations of his fellow-countrymen and to weld the nation into a stable. mighty, and independent entity. Others, again, argue that he was not the master, but the man-puppet of intriguers, who, by pandering to his grosser self, molded him to their will. On only one point do the hero-worshipers and the iconoclasts seem agreed—that he left a vivid impress upon the history of his country. until recent years at least, there has been no middle course between execration and adulation. Even the vast fund of information rendered available by modern research, and particularly through the compilation of the "Letters and Papers of the Reign of Henry VIII.," published under the direction of the Master of the Rolls, has only inadequately served to stimulate historians to probe more deeply beneath the surface, and, discarding the prejudices born less of national than of ecclesiastical allegiance, to endeavor to depict King Harry as he really was and to appraise justly the part played by him in the development of England. The mystery of Mary Stuart still pales beside the mystery of Henry Tudor.

Now, however, there are signs that a solution is approaching. Such a sign is

the appearance of Mr. Pollard's "Henry VIII.," which, originally issued in a sumptuous and costly edition, has been reissued in a less expensive and more convenient form and with revisions and additions that greatly increase its value. Mr. Pollard has no illusions respecting the weaknesses and defects of Henry's character, but neither would he withhold a generous meed of praise for that which he deems truly admirable. In some respects-prompted, perhaps, by unconscious enthusiasm for the after effects of the Reformation—he gives undue rein to the imaginative quality which he possesses to a high degree, and which invests his work with a rare charm. it would be unfair to rank him with Henry's apologists. If the picture he presents be not wholly satisfactory, its shortcomings are in no way due to bias for or against its subject. They are rooted in his interpretation of what he correctly finds to be the key to Henry's policy and career—the temper of the people over whom he ruled as well as reigned. Admitting the force of the argument that Henry's success was largely, if not solely, due to the fact that, despot though he was, he kept in touch with and hearkened to the voice of public opinion, the query immediately rises, If Henry is to be explained by reference to the nation, how stood it with the nation? In his reply to this query Mr. Pollard, it seems to me, has fallen into an error of far-reaching consequences, inevitably involving him in inconsistencies. He begins by pointing out that "the problems of Henry VIII.'s reign can indeed only be solved by realizing the misrule of the preceding century, the failure of parliamentary government, and the strength of the popular demand for a firm and masterful hand," and that "in reality, love of freedom has not always been, nor will it always remain, the predominant note in the English mind. At times the English people have pursued it through battle

^{*}King Henry VIII. By Albert Frederick Pollard. Longmans, Green & Co., New York. \$2.60, net.

and murder with grim determination, but other times have seen other ideals. On occasion the demand has been for strong government irrespective of its methods, and good government has been preferred to self-government." But he proceeds to argue that "generally English ideals have been strictly subordinated to a passion for material prosperity," and that Henry "owed his strength to the skill with which he appealed to the weaknesses of a people whose prevailing characteristics were a passion for material prosperity and an absolute indifference to human suffering." The difficulty with this generalization is not simply that it is faulty, but that even were it sound it would explain little. For it is scarcely more than one way of saying that the Englishman of Tudor times, like the Englishman and every man of all times, responded to economic motives. As a matter of fact, it is easy to show that the Englishman of Henry's day was neither profoundly callous, as compared with his Continental fellows, nor peculiarly active in the pursuit of wealth. His distinctive traits were, rather, discontent, unrest, and depression. The nation was, as it were, neurasthenic. The Lancastrian wars had taken the heart out of the people, had—as Mr. Pollard suggests—disgusted them with the mediæval Parliament, had prepared them for the advent of a monarch who should be king in very fact. In the seventh Henry they found such a king, and the discovery did much to smooth his successor's path. by no means follows that they welcomed the Tudor absolutism because they were inspired by a predominating desire to set about the task of amassing wealth. They welcomed it because they were tired out, because their will was wearied and they realized the necessity for a guiding as well as a restraining hand.

It is obvious that if the key which unlocks the mystery of Henry VIII. is his watchful alertness to public opinion, public opinion cannot have been chiefly directed by a "passion for material prosperity." Henry's policy certainly does not indicate any compelling intention to give his land peace and plenty. He did not, to be sure, saddle it with expensive

wars, and the tax-gatherer was perhaps not so much in evidence as in previous reigns. But neither did he go out of his own very selfish way to make it rich. Had he done so, it is possible we should have heard less of Spain in the New World, though, it may be parenthetically remarked, the very fact that Spain enjoyed such primacy in discovery and exploration is eloquent testimony to the inertia of the Englishman of the days of bluff King Hal. That there was great distress throughout his reign is a matter of common knowledge. The dissolution of the monasteries, the inclosure evils which attended the transition from husbandry to grazing, the fall in the demand for labor, the debasement of the coinage —all combined to create, particularly in the agricultural sections, a situation of grinding want. Yet the King pursued his chosen road, secure in the hearts of his subjects. There were mutterings. there was even rebellion, but the King's ministers, not the King himself, were the objects of the people's wrath. A nation with a "passion for material prosperity" might conceivably have endured Henry for a few years; but it would never have supported him as it did support him throughout the stress of the breach with Rome.

It is true that Henry in part maintained himself by appealing to the weaknesses of his people. But he appealed also to their qualities, and not least to that innate love of freedom which, Mr. Pollard to the contrary notwithstanding, was an animating principle in the breast of even the war-worn Englishman of the early Tudor period. Curiously enough, Mr. Pollard strains every effort to prove that Henry's Parliament, through which he imposed his will on England, was an independent Parliament. That it was in fact one of the most subservient Parliaments in English history does not affect the truth that its master rested his policy on the love of freedom latent in the weary nation. It might not be free of him-it did not wish to be free of him-but it did wish to be free of outside interference, and more particularly of the interference of Rome. The English Reformation, as Mr. Pollard makes evident, was in the beginning a machine-

made revolution. That it became a living force in the nation was only very indirectly Henry's doing. If it was any individual's doing, it was his daughter Mary's. Before Henry died he had almost roused his fellow-countrymen from their lassitude. Mary—a bigot, but in many ways more deserving of sympathy than her father—galvanized England into renewed energy, and with the kindling of the martyrs' fagots lit a beacon that was to make of her sister's reign the most glorious in English annals—the reign that marked the dawning of a day that is not yet done.

To the tired nation—tired, but still cherishing its old-time traditions and already benefited by the New Despotism and the New Learning—came King Henry VIII., in April, 1509. Young, virile, handsome, of magnificent physique, open and genial of manner, gifted with many accomplishments—Mr. Pollard assures us that at least one anthem of his composition is to-day a favorite in English cathedrals—it is small wonder that his accession was hailed by an outburst of enthusiasm. His first act—the execution of the tools of his father's extortion—served only to increase the general rejoicing, while his marriage to Katherine of Aragon carried with it none of the forebodings that a Spanish match held for the Englishman of later times. Beloved by his people, endowed with a vigorous constitution, an indomitable will, limitless ambition, and a magnetic personality, Henry could confidently look forward to a long and prosperous reign that should redound to England's glory and his own—especially his own. Even in the beginning, even in those early years when, in unhappy Katherine's phrase, there was "continual feasting," selfishness marked Henry's every act. Mr. Pollard's judgment is severe but just: "He sought the greatness of England, and he spared no toil in the quest; but his labors were spent for no ethical purpose. His aims were selfish; his realm must be strong, because he must be great. He had the strength of a lion, and like a lion he used it." sublime egotist, Henry is the egotist par excellence in unscrupulousness, dissimulation, and clarity of vision. This last

fact must be kept firmly in mind if we would understand him.

It has been universally recognized that a great source of his power lay in the wisdom with which he chose his ministers, the use he made of them, and the wakeful eye he held upon them. It is not so commonly perceived that if Wolsey, Cromwell, and the luckless rest who served his purpose all too well could never deceive him, he never deceived hi:nself. His apologists have urged, in the matter of the divorce and many another deed of perfidy, that he was really actuated, as he professed to be, by an altruistic patriotism and the promptings of a sensitive conscience. Henry, sneers Arthur Innes with good reason, had "an unparalleled power of reconciling the dictates of desire and conscience." But Mr. Innes elsewhere ranges himself with those who affirm that the King's avowals were genuine in that they were the result of successful self-deception. This view is tenable only on the hypothesis that Henry was of unsound mind. Otherwise, how explain the ugly fact that his conscience never troubled him a whit in the mercilessness with which he pursued all who crossed his path, and the shameless ingratitude visited on those to whom he owed most? "My beloved queen," protested this man of conscience at the trial held for no other purpose than to dissolve the marriage, "I desire nothing so much as that our union be held valid despite the 'perpetual scruple' that has kept me silent so long." And the day after the beloved queen, the single figure whose reputation has come out of this tragedy unscathed, had breathed her last, the man of conscience could testify to the value of his protestations by appearing at a ball clad in yellow from head to Figure again the man of conscience bringing another queen to the block and the next day preparing to wed once more—all for the sake of England. Unthinkable! In truth, there is no alternative between believing that bluff King Hal was not altogether sane, or that he was the most conspicuous example in the history of England of an utterly conscienceless, self-willed, selfish, and absolute monarch, whose success is to be

explained partly by his possession of almost preternatural powers of discernment and partly by the age in which he lived.

In any event, there is no denying that at precisely the period he flourished, Henry, with all his faults, was a blessing to England. "It is probable," Mr. Pollard reminds us, "that Henry's personal influence and personal action averted greater evils than those they provoked. Without him, the storm of the Reformation would still have burst over England: without him, it might have been far more terrible. Every drop of blood shed under Henry VIII. might have been a river under a feebler king. Instead of a stray execution here and there, conducted always with a scrupulous regard for legal forms, wars of religion might have desolated the land and swept away thousands of lives. London saw many a hideous sight in Henry's reign, but it had no cause to envy the Catholic capitals which witnessed the sack of Rome and the massacre of St. Bartholomew's; for all Henry's iniquities, multiplied manifold, would not equal the volume of murder and sacrilege wrought at Rome in May, 1527, or at Paris in August, 1572. From

such orgies of violence and crime England was saved by the strong right arm and the iron will of her Tudor king." In a far more vital sense did Henry and Henry's ministers, Wolsey and Cromwell, to whom Mr. Pollard scarcely does justice—influence the course of events in England. However ignoble the rôle he played in the conflict between Catholicism and Protestantism, the intensity with which Henry pressed the cause he had espoused, and the fact that that cause—in so far, at any rate, as it meant the triumph of the laity over the clergy represented the will of the people, combined to fan into activity the long smoldering but not wholly quenched embers of nationality. Wolsey's policy of the aggrandizement of England and of England's king operated to the same end, as did Cromwell's Machiavellian course. Henry, Wolsey, Cromwell-all three, however unwittingly, set in motion forces that, gaining impetus through the rigors of subsequent despotisms which failed to realize that the Tudors had put an end to the old order of things, ultimately made of the insignificant England of pre-Tudor times the mighty British Empire of to-day.

THE PROPHET OF NAZARETH

OR the Christ of the creeds Professor Schmidt, the accomplished Semitic scholar of whom Cornell University may be justly proud, substitutes in this volume the Christ of the critics. While a radical critic, he is a deeply religious critic. He contemplates the Christ of the creeds with reverence, and with gratitude to the great thinkers who limned his portrait. He is also, as not many of his school are, in sympathy with the Christian missionary spirit. But he affirms that "the old conception, with all its splendor, is no longer glorious because of the surpassing glory of the new." He finds that the Christology of the creeds, though based upon study of the Scriptures in the light of Christian experience, has become no longer tena-

¹ The Prophet of Nazareth. By Nathaniel Schmidt. The Macmillan Company, New York. \$2.50.

ble. What the explorer's spade has done in recovering a buried civilization from beneath the soil of Babylonia has been done by the delving of scholars beneath the text of the Gospels. said that this in its present form is the product of the second century. Embedded in it may be seen the primitive tradition, on which have been superimposed the misunderstandings, the reflections, the speculations, and the inventions of a subsequent time. To recover the original source for a positive knowledge the surest way is to go back of our Greek text to the Aramaic language of Jesus and his Galilean disciples. The specially significant instance of this process is in the oft-recurring phrase, "Son of man," of whose original meaning Professor Schmidt, as in his article in the "Encyclopædia Biblica," was the first interpreter.

On this point his judgment must be reckoned with as that of a philological expert of the first rank. His verdict is that it is "impossible" to maintain the original of that phrase to have been a Messianic title, or that Jesus ever claimed Messiahship. In the Aramaic original the phrase so translated meant simply man, and Jesus used it in speaking in a general or ideal view of the duties, rights, privileges, and powers of humanity. Of course there are passages of the Gospels which, as they stand, cannot well be so interpreted, but for various reasons they are set aside as modifications or misunderstandings of the original. This, then, is the gateway through which Professor Schmidt enters upon a reconstruction of the record, which he conducts with a masterly and easy grasp of all its details and of the critical discussions concerning He shows in this a keen historic sense that seems at times to yield too easily to subjective influences; e.g., the story of the Samaritan woman is "clearly" an allegory of "the Samaritan people that has abandoned its five Assyrian gods, but not attained to the temple-less worship of God in spirit and in truth." Even stranger is the contention that Jesus objected to public prayer as such. Thus iconoclastic is Professor Schmidt's reconstruction, but not less evident is his reverence for the matchless personality which he beholds after chipping off all that seems to him an incrustation. "It cannot be defined; names and titles utterly fail to do justice to it. . . . To have come once under his spell is to be his forever." Here certainly the modern iconoclast and the Galilean disciple are And so to the modern world in its struggle with baffling problems, scientific, economic, moral, Professor Schmidt presents Jesus as the all-sufficient, incomparable leader whom it needs. "The secret of the quickening touch he has ever communicated" "is the thoroughness with which Jesus realized in himself the ethical content of a filial attitude toward God."

True as this is of Jesus himself, it is not the whole truth which those who behold him need. Its defectiveness is suggested by a fact on which Professor Schmidt lays proper emphasis: "It is this need of moral strength to realize a high ideal that constitutes the deepest problem of the age." For moral leadership sublime thought must take form in sublime action; the qualities of the hero must be added to those of the teacherthe heroism that braves and bears all evil for righteousness' sake. The crossbearing life of Jesus, apart from its consummation in his death, could never have imparted those inspirations which endue human weakness with invincible strength. Without the Cross of Jesus and its irresistible appeal, his claim to leadership will not touch what is deepest in human hearts. James Martineau, as unsparing a critic of creed and tradition as Professor Schmidt, clearly discerned this:

"O King of Earth, the Cross ascend!
O'er climes and ages 'tis thy throne."
From Martineau's expression of it Professor Schmidt would probably not dissent. But it finds no clear expression in his portrait of the Prophet of Nazareth. And so, warmly colored with religious feeling as this is, it lacks, at least for the mass of men, the consummate invigorating trait which makes Jesus the Christ, the Leader anointed with the heavenly spirit of self-sacrifice.

Comment on Current Books

Australian life has Australian Life much that is picturin Town and Country esque in itself and novel to American readers. The author, E. C. Buley, describes entertainingly and vivaciously, but with insight, its characteristic institutions and customs—the great sheep farms and cattle ranges, the mines, the Never-Never Land, that fascinating but almost unknown region that comprises half of Australia, the prosperous, enterprising cities, the "swagmen"-farm laborers who travel through the country seeking work wherever they can find it and living a unique life of freedom and irresponsibility—the desert lands with their incongruous trains of camels imported from the East, the Australian himself, a bohemian with great individual courage, energy, and resource. (G. P. Putnam's Sons, New York. \$1.20.)

Those who have read The Boy's Life "The Boy Problem," by of Christ the author of this book-Dr. William Byron Forbush, minister of the Madison Avenue Reformed Church in New York—will admit that he possesses a special qualification for such a work as this. His aim is like that of St. Mark, to tell what Jesus did, and "to show the manly, heroic, chivalric, intensely real, and vigorously active qualities of Jesus in a way to appeal to boys." This is a new thing and not an easy thing to do, even by one who has Dr. Forbush's keen sympathy with boys, but it is remarkably well done. (The Funk & Wagnalls Company, New York. \$1.25, net.)

Letters not from children but to Children's children make up this compila-Letters tion by Elizabeth Colson and Anna Gansevoort Chittenden. The idea is a capital one, and the reader rejoices at the tenderness and kindly humor so abundantly in evidence. One is tempted to give the entire list of authors, but a few must serve: Phillips Brooks is fitly put first, for he had no equal in this class of epistle-writing; Oliver Wendell Holmes, Whittier, Lincoln, Benjamin Franklin, and Hans Andersen furnish but one letter each; Longfellow, Lewis Carroll, Dickens, Edwin Booth, Thomas Hood, Sir Walter Scott, and Sydney Smith are among the most delightful of the twentyfive or more authors represented. Altogether a delightful little volume, and one well worth making. (Hinds, Noble & Eldredge, New York. \$1.)

Wise counsels abound in this Counsels volume-counsels inspired by and Ideals high ideals and wide experience. The real man whom they present is no more like the individual whose words were so travestied by the press on a recent occasion as to threaten the dictionary-makers with a new word, "oslerize," than the caricature of the political cartoonist is like its original. The multitude of extracts culled from Dr. Osler's writings and addresses by his friend, Mr. C. N. B. Camac, of New York, and arranged under twenty general heads, is made serviceable for reference by a good index, as well as by marginal titles. To dip into these pages anywhere is to meet with a thoughtful, strong, and sagacious man. (Houghton, Mifflin & Co., Boston. \$1.25, net.)

Americans have reason to The Life of remember the younger Sir Sir Henry Vane Henry Vane, Governor of Massachusetts, at an anxious moment in its early history, and one of the founders of Rhode Island. But it was in England that the best work of this mystic and radical was done. An influential member of the famous Long Parliament, he was prominent throughout the Civil War and the years preceding the Restoration; so active, indeed, that, though not among the regicides, he was marked for vengeance by Charles II., and ultimately brought to the scaffold. It would be a mistake, however, to regard him as a great statesman, and in insisting that he was one of England's foremost nation-builders Dr. William W. Ireland falls into an error that completely distorts the picture he presents. His point of view throughout is that of an ardent hero-worshiper. He also writes as an uncompromising advocate of the Parliamentary party, his leanings leading him to do less than justice, not merely to the Carolean rulers and their advisers—Laud, Strafford, and the rest-but to Cromwell, to whom Sir Henry Vane was decidedly a thorn in the flesh. His purpose, he tells us, is "to make the facts cry out," and to his aid he summons a liberal use of invective. But if his conclusions must largely be rejected, his book is nevertheless substantially helpful in some respects. It has a certain corrective value, and—albeit in a rambling way—brings together from many scattered sources a quantity of interesting data shedding new light on the period. (Eyeleigh Nash, London.)

With Tommy Tompkins in Korea

A simple description of domestic life in Korea as told by a missionary who is "Tommy Tompkins's" mother, Dr.!Lillian Underwood. Korea is a country both singular and picturesque, and Korean native customs as seen by an American woman living among the people afford ample material for an entertaining narrative. Sometimes the didactic and religious purpose is put a little too prominently to the front, and a little condensation would have improved the book from the literary stand-

point. (The F. H. Revell Company, New

York. \$1.25, net.)

The Work of Preaching

Theological Seminary, are, as the title-page intimates, for a professional class. But they are free from scholasticism, and sensitive to the demands of the present time, which is viewed as at once a harder and a better time for the preacher than any time before, and

demanding better preachers. How to preach, and also how not to preach, is shown, with fullness of direction and caution; but the two things most insisted on are the true theory of preaching and the study of its illustrations in great preachers. The sermon is regarded as not manufactured, but born-a message from God born of the Spirit in the heart, a Gospel message for salvation; but these terms are broadly construed as applicable to all that is included in "the making of man," yet holding the spiritual aim supreme. For practical delineation of the ideal the great lights of the modern pulpit are freely introduced-above all, Phillips Brooks, and Henry Ward Beecher, "the Shakespeare of the pulpit." Though a professor of sociology as well as of homiletics, Dr. Hoyt abstains from special advice upon the peculiarly difficult problem of properly relating the two in applying the Gospel to "the puzzling questions of a complex age." If the general counsel given on how to preach is followed, such advice will be less needed. (The Macmillan Company, New York. \$1.50.)

Letters to The Outlook

INSURANCE OFFICERS

In the interest of the policy-holders and the cause of good insurance it may not be amiss at this time to make some brief but emphatic suggestions concerning the actions of the trustees and directors of some of our insurance companies in the selection of the officers who are to guide the affairs of their respective institutions. I am convinced that in the choice of a president, in addition to executive or managerial ability, two requirements, each of prime importance, should be kept in mind. These are, first, that he be thoroughly versed, in theory and in practice, in the broad fundamental principles underlying the science of life insurance-in other words, that he be an actuary in the larger sense of that term; second, that he be equally fitted by theory and practice to deal intelligently with the problems arising in the world of finance. I purposely place this requirement last, for, unfortunately, in the minds of many it seems to be the single desideratum.

The reasons for the above requirements are not far to seek. Business concerns look for their managers and executive heads among those who through years of apprenticeship have made themselves familiar with the various phases, technical and otherwise, of the business under consideration. I think it would be unwise to deviate from this rule in

so technical and complicated a profession as that of life insurance. Years of study and practice are required to become familiar with the principles of insurance, and to keep pace with the rapid evolution and growth in the application of these principles to our social and economic needs; it is absurd to suppose that this function can be exercised with maximum efficiency by one whose previous training has been that of the banker or railroad man, no matter how proficient or successful he may have been in his own line of work. The insurance executive should know enough about the technicalities of insurance to pass intelligently on the larger problems presented by his company, without depending absolutely or to any considerable extent on the advice of subordinate officers. He should not, like Mr. McCurdy, be obliged to leave everything to his actuary. He should be enough of an actuary himself to know whether the mortality table adopted by his company is proper, whether the interest assumptions are safe, whether the dividends are being accumulated or distributed according to sound actuarial principles, whether the premiums are on a proper basis and loaded according to principles of equity, whether the securities of the company are properly valued in its assets from year to year. He should be able to suggest policy forms to meet the conditions of healthy competition, to pass on broad questions of agency management, to distinguish between wise and foolish insurance economy—all matters requiring years of insurance experience. This is what he is paid for, and no company can afford to have at its head a man whose attainments are not professional, in an insurance sense, to this extent at least. The president of an insurance company should be as well fitted to lay down the broad principles to be followed in his actuarial as any other department; indeed, this consideration is especially important, for on the wise guidance of the affairs of this department depends the stability of the company. The financial operations are, or should be, of so conservatively restricted a character as to require the cautious, prudent judgment of the man farthest removed from the sphere and influences of the speculative field.

In the recent attempts to select a president of the Mutual Life we have heard, among others, the names of Claffin, Eckels, Truesdale, Morgan, Fish, Grout, Peabody, put forward as possible candidates; to my mind they are all impossible candidates if the best interests of insurance and the policy-holders are consulted. Not one of these gentlemen, gifted though he may be in his particular profession, is fitted by experience, practice, or theory for the complex duties of this office

Where, then, shall the proper candidate be found? Most naturally among insurance men with practical experience. It would not be difficult to find men of undoubted integrity and the highest ability now active in this field of work willing to serve in the executive capacity for a fraction of the compensation now accorded some incumbents of this position.

The ideal type of insurance executive is embodied in the modern actuary, broadly versed in the principles of finance and acquainted with every detail of the insurance business. It is not uncommon in English companies to find the general manager and executive head an actuary of first rank, and the tendency on the Continent is decidedly towards professional training and the requirement of scientific and technical attainments in the superior officers of a life company.

In conclusion, I have made my point if I have made it clear that the head of an insurance company should be sought for in the insurance profession, and that he be theoretically and practically equipped in the technical principles of insurance as well as the general practice of finance. Public faith in the principles of insurance has not been disturbed in the least, and great names are not

needed to restore confidence; we have had enough of dummies and figureheads, and the quickest way to inaugurate the expected reforms is to place men of integrity and real efficiency in command.

JAMES W. GLOVER.

THE SUPERVISING TEACHER

In recent issues of The Outlook I have noticed articles on education in the Philippines. One of these articles made special reference to the supervising teacher, but it entirely omitted one very important phase of his work—the difficulties he has to encounter.

In some respects the greatest difficulty lies in the fact that the supervising teacher is sent to his district with no authority whatever. In fact, he receives no clear instructions about his work, and is not sure just what he is supposed to do. There is no compulsory educational law, yet he is expected to have one-third of the school population in the public schools. The reports that the people are so enthusiastic over education that the pupils have to be turned away are fiction rather than fact. I have yet to see or hear of any school (and I have heard of a good many) where a good attendance is kept without the aid of the municipal police. These police are, of course, under the orders of the "presidente," so education, to a certain extent, is in his hands. However, he is not supposed to use them for such a purpose, but, thanks to the happy-go-lucky way of enforcing the laws in the provinces, the teacher, if the "presidente' is of any usewhich sometimes happens—can get a fairly good sized school. If, on the other hand, the "presidente" cares more for political pull than for educational push-which is often the case—the school, in spite of the strenuous efforts of the teacher, is apt to have a checkered career. Furthermore, although one-third of the school population is wanted, there are not enough books and other school supplies for half that number. A teacher may not receive enough pencils during the entire year to furnish his pupils once, and he receives the other supplies in proportion. It is often necessary to start a new school of one hundred to two hundred pupils with a chart, a blackboard—which is sometimes omitted—and a dozen pieces of crayon. Add to this collection a teacher who knows but little English or anything else, and the outfit is complete. And yet a teacher is supposed to have several such schools and teach the pupils in three years as much as an American child will learn, in his own language, in four years. But even supposing there were enough supplies and

good teachers, there is not enough money to pay them with. I know of a town of twenty thousand inhabitants (this is no exception) in which the treasurer is unable to pay the salaries of five teachers. Some "barrios" (villages) promise to pay the salaries of their teachers, but that is about as far as many of them get in that direction.

The lack of authority on the part of the supervising teacher, of supplies for the pupils if they come, and of money to pay the native teachers, who are not very good, of course, is a great detriment to the department and a great hindrance for the supervisor. The schemes he devises to surmount these difficulties are too numerous to mention. But with all this the department is not doing so much as reports would have one believe.

The "liberal salaries" that the teachers receive do not stand a close examination. A supervising teacher has charge of from five hundred to three thousand pupils, scattered over a vast territory. With these he has difficulties far greater than a superintendent over an equal number in the States, to say nothing of his environment, yet he does not receive as much salary. In fact, although his work is never finished, he does not, as a rule, receive as large a salary as many stenographers of common-school education, who work but five or six hours per day, and with no responsibility whatever. When the department kindly informs the Filipino teachers, in order to make them feel contented with their small salaries—but as much as they earn—that their superiors receive twice as much here as they could get in the United States, it shows how ignorant the insular officials are of their hard-working subordi-

The entrance of the Educational Department into the Civil Service was hailed as a great advantage for all concerned. If such be the case, the advantage is hard to find. I have not yet heard a division superintendent or a supervising teacher say a word in its favor, but many have been strong in their denunciation of the plan. At present, if an experienced teacher, and probably a college graduate, wants a raise in salary, he must pass an examination to show that he knows enough to teach a primary school. Under the present system a teacher may work ten or fifteen hours a day, being out in all kinds of weather for weeks at a time; but if, through over-exertion, he is not able to attend to his duties part of a day, his salary is deducted for the time lost. He may make arrangements for spending the long vacation, and at the eleventh hour he may receive the welcome news that he must work a few weeks extra! He is supposed to receive transportation reimbursement for visiting schools, but it is so much trouble to get it, and he has to wait so long, that he is utterly disgusted.

I have simply tried to mention a few of the unnecessary difficulties that a supervising teacher has to meet. It seems to me that the natural hindrances of the country are sufficient without extra ones being placed upon him. To a certain extent it must be laid to our American way of wanting to do everything in a minute and not counting the cost. In spite of all this, the supervising teacher is respected and has done a great deal, but he is respected on account of his own personal worth, and he has done a great deal because of his own downright American grit and tact.

Philippine Islands.

A WORD IN BEHALF OF THEOLOGY

Why is it that in these serene irenic days no one can say a good word for kindness and brotherliness and the good deed without a side slash, more or less savage, at theology? Is it because theology has frowned upon mercy and charity and good works? Or have we just discovered, at the end of the ages, that theology has all along been the secret and unsuspected enemy that has kept the world from being good? It is just possible that in all this indiscriminate attack upon theology we may be striking at a friend of the good deed instead of a foe, or at least that what we mean to condemn is not theology in itself, but a bad kind of theology.

It is no very serious matter when ignorant and unbalanced men attack theology, but when such a large-minded, efficient friend of the good deed as Jacob Riis, in his recent article in The Outlook on "Neighbors," graciously but pointedly suggests that in order to be neighbors theology must be retired and dispensed with, the other side of the case calls for recognition. The writer has the privilege and pleasure of conducting classes in theology daily. Some of the young men who are preparing for the ministry enter the classes somewhat reluctantly, with a predisposition against theology, fostered, strangely enough, by some of our ablest religious journals. And yet this deadening and dividing study has actually led us into a very true and a very beautiful spiritual and intellectual neighborliness. We deal with dogmas (those horrid bugbears) daily. One of these dogmas, that upon which we dwell most, is the dogma of the Divine Fatherhood, another is the divine humanity of Jesus Christ, another is the suffering of Infinite Love for men. another is that of the Immortality of the soul. Freely, frankly, sincerely, we discuss these dogmas. Upon the theories concerning

them we do not agree, but the great dogmas themselves arouse us, strengthen us, draw us together, create ideals, fit us for intelligent and high-hearted service of men. Why is this?

A man arose once in a prayer-meeting—a soldier and a man of affairs, who had united with the Church late in life, but with a great sense of the joy and goodliness of the Christian life-and, with no little earnestness and warmth, stated that for him, at least, theology had not the slightest value; he wanted none of it. "It was enough for him," he continued, " to know that God is love, that Jesus Christ is our Saviour, that sin is forgiven, that there is an eternal life hereafter." ology, every word of it! For, the moment faith and experience are translated into intellectual affirmations, theology begins. And we can no more dispense with it than with any natural and legitimate expression of inward feeling and thought.

It is high time to discriminate in this field, or harm and loss to Christianity will certainly ensue. There is a theological dogmatism, a theological systemism, a theological absolutism, against which the protest cannot be too general or too emphatic. But there is a theology that is sane, stirring, uplifting, humanizing, that knows its place and its time, that exists to minister and not to be ministered unto. And to find that theology, and put it to usury in behalf of the neighborly spirit and the good deed, cannot be too urgent a pursuit.

Berkeley, California.

FILIPINO CHARACTER

In Mr. Brownell's very interesting articles on the Philippines, contained in recent issues of The Outlook and "Public Opinion," the statement is made that the Filipino language has no words for "independence" and "gratitude." This is an error. Kalayaan means independence; pagsasarili means self-government or republic; and the idea of gratitude is conveyed by the phrase utang na loob—literally, debt of the heart. The words tungkol and tupad have meanings closely allied to the latter. The fact that the Bible and as many as a dozen daily papers are printed in Filipino is sufficient proof that the language has adequate power of expression

A study of the psychology of his speech would help us materially to understand the Filipino's mental attitude. The vigor of the language lies not in the roots but in the particles. The former may seem to be inadequate, but when modified by the latter they

become capable of expressing every shade of meaning.

In general, the genius of the Filipino language gives preference to indirect, negative, and periphrastic statements over direct and positive ones. The Filipino says, "Walang di inagaw"—There is nothing not stolen; where we would say, Everything is stolen. Likewise, to a negative interrogation, the Filipino, like the Japanese, will usually answer affirmatively to convey a negative meaning, where we would answer negatively.

The Filipino is apt to convey his mental habit into the little Spanish or English which he may learn, and the resulting confusion leads to misunderstandings and false charges of prevarication. I have found the Filipino to be both truthful and grateful.

DAVID J. DOHERTY, M.D.

A JOYOUS THANK-OFFERING

Reference has been made in former years in The Outlook to the interesting work of School No. 4 (Rivington Street), New York City. Last year the children of two classes so enjoyed making a Thanksgiving offering to an Old Ladies' Home in the neighborhood that this year all the children in the school over 2,100 Jews-were told that they might, if they wished, each bring one thinga potato, an apple-anything. It was expected that thirty or forty baskets might be filled. Instead, the response was so hearty that officers and teachers were overwhelmed with three hundred basketfuls-potatoes, onions, cabbages, apples, oranges, bananas, packages of crackers, cereals, tea, coffee, sugar, salt-all sorts of eatables. Teachers and children worked hard to distribute it all, but it proved impossible and a van was secured. The owner of this refused to accept any pay for his services, saying he had attended that school when a boy and would show them that he too could be "benevolent." The distribution was made not only to the Old Ladies' Home, but also to the Daughters of Jacob, the Hospital of St. Francis (Catholic), a Methodist Orphan Asylum, and the Salvation Army.

To any one who knows the extreme poverty of those in this quarter of our city, so joyous an offering, permeated with the spirit of self-sacrifice and crowned with the perfect tolerance that gives according to need, irrespective of sect or religion, is not only beautiful, it is an inspiration to "do likewise." All honor is due those loyal, self-sacrificing principals and teachers whose example creates and fosters the atmosphere which makes such things possible.

M. E. J.

Brooklyn, New York.

Avoid a Trip to the Police Court

The fine amounts to little—it's the hours of delay, the inconvenience and possible humiliation for you and for those in your company that try the patience and spoil the pleasure of the whole trip,

All this can positively be avoided by equipping

your car with

Miles per Hour

KNOW

how fast

Traveled

KNOW

how far

Plexible

Driving

Shaft attaches to Front

The Warner **Auto-Meter**

(Registers Speed and Distance)

This little instrument always tells the truth. It registers with ABSOLUTE ACCURACY from 1/2 mile to 60 miles per hour. It attaches to any Automobile made.

Without it you never know your exact speed - and the temptation to go a little faster and a little faster is almost irresistible-you know how it is. And you know, too, what happens to you and your party when you think you are going 8 miles an hour and the Policeman's stop watch says 15.

Don't guess yourself into trouble—KNOW and keep out of it. The Warner Auto-Meter is your salvation.

And it's your ONLY salvation. Because the Warner Auto-Meter is the only speed indicator which is sensitive enough to be absolutely and unfailingly accurate at speeds under 10 miles an hour.

Because it's the only one which works perfectly in all positions and at all angles, on rough roads or smooth, up hill or down.

Because it's the only one which changes with the speed alone and in which the indicator does not dance back

and forth from the jar of the car.

The Warner Auto-Meter is the only speed indicator which is actuated by the same fixed, unchangeable Magnetism which makes the Mariner's Compass reliable FOREVER under all conditions.

06694

SEASON

No one else can use Magnetism to determine the speed of an Automobile, though it's the only positive and sure way. Because there is just one way in and sure way. Because there is just one way in which Magnetism can successfully be used for this

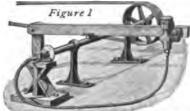

purpose and we have Patented that way.

There is nothing about the Warner Auto-Meter which can give out, or wear out, or get out of adjustment. It is the only speed-indicator made without cams, plates or levers, and in which there is no friction. Friction wears away the cams and levers in other speed indicators, which are necessarily so small that 1-1000 of an inch wear will throw out the reading from one to five miles per hour.

One Warner Auto-Meter will last a life-time. It is as sensitive as a Compass and as Solid as a Rock. Otherwise it couldn't stand our severe service-test, which is equivalent to a trip of

160,000 Miles at 50 Miles per Hour on Granite Pavements Riding Solid Tires.

The practical Warner Testing Machine is shown in Fig. 1. The wheel connection of the Auto-Meter is attached to a shaft running

200 revolutions per minute. Across this shaft lies a plank which is hinged at one end and has the Auto-Meter attached to the other. Brazed to the shaft is a knob of steel, which at every revolution "bumps" the plank, giving to the Auto-Meter 200 shocks per minute while it is showing a speed of 50 mules per hour. Each one of these shocks is more severa

Each one of these shocks is more severe than would be suffered in an entire season's riding. After running 10 hours a day for THREE MONTHS, actual tests show the Auto-Meter to be recording the speed with the same accuracy as at first within 1-1000 of 1%, or less than 6 inches per mile.

No other Speed Indicator on Earth could Stand this Test.
This is why we sell each Auto-Meter on a
10 YEARS GUARANTEE

and why we gladly renew any Auto-Meter (which has not been injured by accident) if the Magnet (the HEART of the instrument) is less accurate than 1-10 of 1% after 10 years use.

We will gladly tell you more about this wonderful instrument if you will write us, If you write TODAY we will send you something every motorist will prize—our Free Book—"Auto Pointers."

104 Roosevelt St., Beloit, Wis. The Warner Instrument Co.,

(The Auto-Meter is on sale by all first-class dealers and at most Garages.)

Dainty Foods Demand It

IN EVERY Receipt that calls for cream of tartar, soda, or baking powder, use the Royal Baking Powder. Better results will be obtained because of the absolute purity and great leavening strength of the Royal. It will make the food lighter, sweeter, of finer flavor, more digestible and wholesome. It is always reliable and uniform in its work.

Alum and phosphate baking powders—some of them sold at the same price and some of them cheaper—will make neither dainty nor wholesome food.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

The Election in France

M. Fallières, President of the French Senate, was elected President of the French Republic by the National Assembly on Wednesday of last week on the first ballot; 846 votes were cast, of which M. Fallières received 449 and M. Doumer 371, and there were 28 scattered votes. The Assembly, consisting of the Deputies and the Senators, met in the Congress Hall of the Palace of Versailles at one o'clock; and although the proceedings were long, owing to the fact that the members of the Assembly voted in alphabetical order, there appears to have been very little doubt about the result from the beginning. When the announcement was finally made, it was received with a great outburst of enthusiasm. The President-elect returned to Paris from Versailles escorted by a guard of honor, and was received with the greatest friendliness at the city limits and during his passage to the Elysée Palace, where he was met by President Loubet. There have been nine Presidential elections since the establishment of the Third Republic, but only two Presidents, Grévy and Loubet, have finished their term of office. The election of M. Fallières means the continuity of the policy of moderation in home affairs and conciliation in foreign affairs which has stamped the administration of President Loubet from the beginning. The President and the President-elect are old and warm friends, and their attitude toward current politics is substantially harmonious. M. Fallières is a Republican of pronounced though not radical tendencies, a resolute opponent of revolutionary Socialism. He is also a devout Catholic, but a believer in a free Church in a free State. During the exciting discussion of Church and State affairs which has been going on in

France, the new President's course has

been marked by consistent support of the movement looking to the separation of Church and State, and by consistent moderation in dealing with the Church. He has on more than one occasion shown the kind of courage which is essential to the head of a great State, and while he is in sympathy with the liberalizing movement which is rapidly making France thoroughly republican, he is not afraid to oppose the popular will or to advocate an unpopular measure.

Clément Armand Fallières has The New very much the same kind of President background as President Lou-They are both sons of the people, children of the soil. Fallières was born sixty-four years ago, in the old province of Gascony, the grandson of a blacksmith and the son of a peasant, like President Loubet. He went to Paris at an early age, passed his examination for the bar, returned to Agen, his native place, and soon secured a first position as a lawyer. He was elected Mayor, returned to Paris as deputy, became Assistant Secretary of the Interior under Jules Ferry, and later was a member of several Cabinets, finally succeeding President Loubet as President of the Senate. Like his predecessor, the new President has kept the simple tastes of his birth and breeding, and represents a kind of integrity by no means too common among French public His private life has been free from even the suspicion of any kind of scandal. He is devoted to his family, and, like M. Loubet, loves his fireside, his books, and music. Coming to the great position of President of the Republic in the prime of life, with thirty years of parliamentary experience behind him, intimately acquainted with the ins and outs of French politics, having per-

Digitized by Google

sonal relations with the great majority of public men, a man of sound judgment, good health, stainless morals, and moderate temper, there is every reason to believe that the administration of M. Fallières will mean the steady progression of the French people away from the discords, differences, and uncertainties of the past toward unity, harmony, and the habits of free government. It is fortunate for France that it is likely to have a continuity of policy in the hands of two Presidents so free from entanglement with any of the factions, and of substantial rather than brilliant abilities: for France needs nothing so much as time for quiet growth in republican ways, thought, and habits of action.

In inaugurating the movement for the Moroccan Conat Algeciras ference at Algeciras, France and Germany agreed to consider (1) organization, by international accord. of the police, except on the Algerian frontier; (2) surveillance and repression of contraband arms, except along the Algerian frontier; (3) financial reforms, including the creation of a State bank with the privilege of issuing currency; (4) study of the customs and new means of raising revenues. Two questions arise: Why are Americans to assist in settling these matters? How can they assist except by voting for one side or the other, in which event they are sure to offend a nation with which the American Government is on frlendly terms? Last week, in the United States Senate, two prominent Senators, Mr. Bacon, of Georgia, and Mr. Hale, of Maine, expressed the wish that the President had not accepted the invitation to the Moroccan Conference. their remarks one might gather that the appearance of our representatives at such a congress, or indeed at any congress of European Powers, was something unprecedented in diplomacy—at least a violent departure from Washington's counsels against "entangling alliances." Our right to be at a Moroccan conference is one hundred and nineteen years old. In 1787 we contracted a treaty with Morocco. In 1836 we contracted another. In 1880 America was one of the twelve civilized Powers which united at Madrid in establishing the right of external protection to life and property in Morocco. The treaty agreed upon was ratified by the United States Senate and is still in force. It is said with truth that our interests in Morocco are commercial and not political; but extraterritorial jurisdiction directly affects commercial interests, and, in the present Conference, so do the propositions for establishing an international police, a State bank, new currency, customs, and taxes.

Though the oppo-American Intluence nents in the Conference are France and Germany, no conflict should arise if they confine themselves to the points raised by their respective programmes. If they exceed these, danger may possibly result. Should our delegates be called upon to vote in a way to aggrieve either France or Germany, the Secretary of State can instruct them to withdraw from the Conference; but no such event is anticipated. In any event, if a treaty is agreed to, the American delegates will subscribe to it ad referendum, leaving the question of the approval of their act to the subsequent consideration of the Department of State, and, if the Department's approval should be given, leaving the resulting treaty to be passed on by the American Senate before its final rati-Our delegates, being more disfication. interested than are any others, are peculiarly qualified to prevent either Power from any action not included in the programme. In the opinion of State Department officials, the complete dissociation of our delegates from any policy, act, or expression which in the remotest degree would tend to thwart or delay a harmonious arrangement between the treaty nations and Morocco should, in the case of any unfortunate situation, add force to the absolute fairness of their advice, and thereby in this negative but none the less influential manner make for the complete harmony and accord of the Conference. The delegates will be in constant touch with the Department by cable, and whatever decisions they may reach will be subject to the approval

of the Department. At Portsmouth President Roosevelt and the Administration exercised a beneficent influence in shaping the result. It is to be hoped that at Algeciras the American delegates may exercise a similarly beneficent influence. No other spirit or attitude would justify their presence at the Conference or represent the purpose of the American people.

The strained diplomatic re-

France and lations between France and Venezuela Venezuela, reported in The Outlook's last issue, were brought to a definite and serious crisis by President Castro's ill-considered and insulting treatment of M. Taigny. The former French chargé d'affaires had gone on board a French steamer at La Guayra, and was refused permission to return on shore on the allegation that he had boarded the vessel without an official This he was accustomed to do. and his diplomatic position had made it entirely proper. The action of the Venezuelan authorities was arbitrary and insulting both to M. Taigny and his Government; and the excuse that M. Taigny had ceased to be an official representative of France is without force because of the invariable international practice of according diplomats protection and courteous treatment until they have actually left the country with which they have broken off relations. France immediately retaliated by notifying the Venezuelan chargé d'affaires at Paris, M. Maubourguet, that he must leave French territory, and his passports were forthwith sent to him, which is the official method of actually expelling a foreign representative. Beyond this, France will require from Venezuela a formal apology for its action, and is to make a naval demonstration and an exhibition of force in Venezuelan waters and ports by means of the squadron of three ships now in that vicinity, and of others which have been sent across the Atlantic to The entire French press join them. agree in characterizing President Castro's action as intolerable and in demanding unmistakable and substantial reparation. and American sentiment sustains this

position. The influential "Temps" declares significantly that France will choose a method of proceeding which will not hurt any one's interest and at the same time will "bring to his senses this strange dictator who in the end will be brought to account by Venezuela itself." Back of the immediate cause of offense lies France's determination to secure a settlement of the matters in dispute already described in The Outlook; namely, the non-payment of awards to French creditors and the hostile action toward the French Cable Company. The assertion that the French Cable Company had favored the insurgents and had refused to pay taxes are positively denied by French officials. It is understood that France has given full assurances and explanations to our own Government about its action in Venezuela. Washington advices indicate that the appointment of our Minister at Caracas to act for France in necessary matters during the cessation of diplomatic relations between France and Venezuela has not been received favorably by President Castro, although such a procedure is the invariable practice in international situations like that existing at present; it is even intimated that despatches from our Government to Mr. Russell have been intercepted by the Venezuelan Government. If this is true, the United States will undoubtedly demand an explanation and will deal with the whole situation as an interested party. That President. Castro is quite capable of acting in an unreasonable, petty, and spiteful way has been demonstrated more than once.

6

Last week the Russian Law and Order Government continued in Russia its work of restoring law and order. In St. Petersburg it arrested the members of the latest Workmen's Council, as it had arrested the members of its predecessors. Undismayed, a new Workmen's Council was promptly elected by the Socialists and revolutionaries, This Council immediately issued an address to workmen throughout Russia, threatening with death all who did not obey its commands. In the provinces, acting on the Government's instructions,

the military commanders proceeded unsparingly against the revolutionists. On the other hand, the Government summarily retired nineteen generals, all members of the Council of War, representatives of the bureaucracy and opposed to the Witte plan of reformed government. The Czar apparently regards it as essential that the Russian army should be in sympathy with the plan now decided upon by himself and his advisers. His action is a direct blow at the hitherto powerful Council of War itself. Those working for a more liberal government have received further encouragement by the sudden rush last week to register for the elections to the Duma, or Parliament, the advisory body proclaimed six months ago. period of registration, which expired at the end of last week, has been extended a fortnight. The unexpected rush was due to a final awakening by Socialists and revolutionists to the necessity of having representation in the Duma, after having put themselves on record as favoring boycotting the Duma and continuing the armed revolt. They are now concentrating their attention on getting a full registration from the labor, professional, and Socialist organizations throughout the country.

(6)

The Russian revolution-Russian ary party is composed Political Parties of Social Democrats and Anarchists; the Moderate or Liberal party last week split into two well-defined forces, Constitutional Monarchists and Constitutional Democrats. The latter represent the advanced liberal opinions of the zemstvoists—the members of the district and provincial councils. Constitutional Democrats have now exhibited sufficient political strength to induce the Social Democrats to enter upon a campaign of registration, the latter party hoping to win enough electors to hold the balance of power and force an alliance and a division of seats with the Constitutional Democrats. Thus the Moderate and Revolutionary parties may find some common standing ground of method, if not of principle. There might be an advantage in this both to

Constitutional Democrats and to Social Democrats, but the greater advantage would lie with the latter, for, under the present electoral plan, by which the workmen's representatives are to be merged in the general electoral commissions both in the provinces and in the cities, there would seem to be little chance anywhere for an absolute Socialist majority. The news of last week logically continues Russian political history from October 30, 1905, when the Czar published his manifesto granting elementary political rights and appointed Count Witte Prime Minister. Up to that date there had been, as there are now, three great general political divisions in Russia—reactionaries, moderates, revolutionists, with many subdivisions. Up to that date most of the news from Russia had concerned the doings of the reactionaries; from that date they were definitely dethroned, and most of the news from Russia has concerned the Moderates and Revolutionaries. One may at least hope that the reactionaries are permanently set aside, that autocracy and bureaucracy have definitely given place to moderation, reasonableness, a liberal, perhaps a constitutional government.

æ

The only interruption of the The Liberal steady movement towards Victory Liberalism in England as shown by the elections last week was the triumphant return of Mr. Chamberlain to his place in Parliament by an increased majority and the election of seven Unionists from Birmingham, that city, in striking contrast to Manchester and the rest of England, presenting a solid Conservative front. The Liberals interpreted Mr. Chamberlain's success as a tribute to his personal popularity and to his skill as an organizer of politi-For thirty years he has been cal forces. the foremost citizen of Birmingham. As member of the school committee, the Common Council, and as Mayor, he contributed greatly to the improvement of municipal methods, and his later career has strengthened his hold upon his fellow-citizens. Outside of Birmingham, one Liberal success has followed

close upon another; all the members of the Liberal Government have been returned, many by a very large majority, while seven members of the late Conservative Government have been beaten, including the ex-Prime Minister. week before last the vote was largely in the cities; last week it was largely in the rural districts; and, judged by the results. Liberal sentiment has captured the country as completely as it has captured the town. The Liberals had at the end of last week 228 seats, and had secured a majority above the combined Unionists, Irish Nationalists, and Labor-Some estimates place the probable total strength of the Liberals at nearly 400. The great majority which the Liberals are piling up is attracting even less attention than the extraordinary growth of the Labor vote. In the last Parliament this vote was represented by six members; in the new Parliament it is believed that it will be represented by not less than forty votes, divided into three groups, the largest made up of about twenty-two members, who are described as Independents; the second, including Mr. Burns, Mr. Broadhurst, and other well-known moderate labor men, who are likely to act with the Liberals; and the third, a small group, made up of extreme men of various types, mostly Socialistic. The new Parliament will contain an extraordinary number of men unused to its rules and customs. is estimated that the number of new members will exceed three hundred, a fact which is significant of the revolutionary results of the election, and significant of the very important changes which the Liberal and Labor factors predict.

The First American Ambassador to Japan as the first Japannese Ambassador to the United States has been followed by President Roosevelt's nomination of the Governor-General of the Philippines, Luke E. Wright, to be the first American Ambassador to Japan, and there is every reason to suppose that the nomination will be approved by the Senate. On another page will be found a portrait and personal sketch of

Viscount Aoki. Governor Wright's record and personal history have been familiar to American readers since his appointment to the important post he has held in our Eastern possessions. He has been in the Philippines for five years, having first gone out as a member of the second Philippine Commission; he was made Vice-Governor-Gen eral in the following year, when civil government was first established. that work he played an important part, and was, moreover, Acting Governor for some time during the necessary absence of Secretary Taft. The two men worked in perfect accord in putting the new Philippine Government into successful operation; and when two years ago Mr. Taft became Secretary of War, the ap pointment of Mr. Wright as Governor-General made it possible to carry on without a break and with perfect harmony the policy of our administration already firmly established by Mr. Taft. Governor Wright is by birth a Tennessean, was for several years Attorney-General of that State, and in 1896 was a supporter of Palmer and Buckner, the "Gold Democratic" candidates for President and Vice-President. Governor Wright will be succeeded temporarily in office at Manila by Judge Henry T. Ide, the Vice-Governor, who is now acting as Governor-General during General Wright's absence in this country. It is understood, however, that upon Judge Ide's retiral from office on June 1 next, in accordance with his resignation tendered some time ago, the appointment of Governor-General will be given to James F. Smith, who has served in the Philippines as Colonel and Brigadier-General of Volunteers, as Associate Justice of the Supreme Court, and as a member of the Philippine Commission, in which he filled the duties of Secretary of Public Instruction.

The Philippine Bill
Passes the House
So much has been said about the firmness and fighting force of the so-called "insurgents" in the House that it was to many a surprise that the Philippine Tariff Bill should be passed by an overwhelming majority.

The final vote was 258 to 71. Of the opposition, 59 votes were from Republican members, while the Democrats cast only 12 votes in opposition. Had the Democrats as a unit opposed the bill, it could not have passed. Thus, so far as the lower House of Congress is concerned, a measure which has its foundation in justice has been adopted with such general assent by the country at large as to indicate that the American people disapprove factious or interested opposition to a policy of making the Philippine Islands prosperous and a satisfactory place of residence for the people in whose behalf the United States exercises control. The bill has been outlined in The Outlook; its main effect is to reduce the tariff on sugar and tobacco coming into the United States from the Philippines from the present seventy-five per cent. of the Dingley duty to twenty-five per cent. thereof until 1909, when they are to come in free of duty altogether. Several attempts were made to modify the measure by amendment, but all of them failed, with the single exception of a concession by the majority in agreeing to include rice, together with sugar and tobacco, as articles on which absolute free trade is not to be applied until 1909. The bill has been introduced into the Senate, and the indications are that, while it may encounter strong opposition, it will ultimately pass. The great danger to be feared is that it will be so amended as to make its effect only partial and less beneficial than it should be.

☻

If the members of the The Panama Senate Committee on In-Investigation teroceanic Canals expected to get any first-hand information from Mr. Poultney Bigelow with regard to affairs on the Isthmus, they must have been sorely disappointed. His testimony consisted largely either of refusals to answer questions or of "impressions" gathered from unnamed persons. illustration may be taken from his broad assertion that many engineers of note declined to accept Government employment in the Canal Zone because of their disapproval of the methods adopted. Pressed to give names, he finally mentioned two, those of William Barclay Parsons (whose friendly and appreciative relations to the Panama work have been shown in his printed articles) and of Mr. John R. Freeman, of Boston, who instantly denied the statement under his own name. Mr. Bigelow's refusal to give other names on the ground that it would injure his informants' reputations led to his being placed under nominal arrest for contempt of the Committee, but it is not judged probable that proceedings or prosecution will be pressed against him. His melodramatic declaration, "You can put me on bread and water, or even condemn me to Colon, but you cannot make me disclose that which has been given me in confidence," will not, it is confidently hoped, be put to the test. As to his actual observation on the Isthmus, Mr. Bigelow said that he spent the greater part of two days there. Mr. Shonts says that it was twenty-eight hours and ten minutes, and that "in that time Mr. Bigelow accumulated a fund of exact knowledge sufficient to enable him to draw a general and sweeping indictment of the President, Secretary Taft, the Canal Commission, Governor Magoon, Chief Engineer Stevens, Colonel Gorgas, and everything that has been done on the Isthmus since the American Government came into possession of the Canal Zone." Before the Committee Mr. Bigelow said that he had spent most of his time in investigating sanitary conditions, and had found that laborers were landed in an oozy swamp of a pestilential character, and that their housing and sanitation were atrocious. The thoroughness of his investigation is illustrated by Mr. Shonts's quotation of Mr. Bigelow's statement that the volume of water in a recent rain was so great that it "backed the sewage up into cellars and ruined many houses "—the truth being, Mr. Shorts points out, that there is not a cellar in Panama, and never has been. The country at large seems to be of all but unanimous opinion that the circumstances of Mr. Bigelow's investigation make his testimony practically valueless, and that the verdict of the New York "Tribune," "laughed out of court," is substantially correct.——The Senate Committee has, it is reported, summoned as a witness Mr. Wallace, whose resignation was so severely criticised by Secretary Taft. It is announced that the Canal Commission will let out to responsible contractors comparatively short sections of the actual work, in the belief that in many cases the work can be done better and more expeditiously by contract than by the Government directly.

₽

For many years the Na-The National tional Board of Trade Board of Trade has been meeting in annual sessions in Washington. During that time it has discussed many subjects, and its recommendations to Congress have influenced legislation. Its influence stands for a concentrated expression of the opinions of its constituent associations—local Chambers of Commerce, Boards of Trade, and similar business Its meeting at Washington last bodies. week covered such topics as our merchant marine, inter-State commerce law, railway transportation, the consular service, postal affairs, Federal control of inter-State insurance, tariff and reciprocity, internal waterways, international arbitration, national and international currency, pure food laws, and national bankruptcy laws. From such a representative body an expression of opinion on the general subject of tariff revision is of peculiar pertinence. It gives us satisfaction to chronicle the fact that the resolution introduced by Mr. Eugene N. Foss, of Boston, well known as an outspoken advocate of tariff revision, was adopted. The resolution sets forth that, recognizing the principle of protection as the established policy of our country, the National Board of Trade advocates reciprocal concessions by means of a dual—or maximum and minimum—tariff as the most adequate and practical method of relieving the strained situation with which we are now confronted. Furthermore, the recommendation is made that the question of the schedules and items to be considered in any scheme of reciprocal concessions may preferably be suggested by a permanent tariff commission, to be created by Congress and appointed by the President, this Commission to consist of economic, industrial, and commercial experts. Finally, action was urged upon Congress at the earliest possible time, in harmony with the recommendations made at the recent National Reciprocity Convention. This is all very well, but we think it unfortunate that the National Board of Trade did not also put itself on record against that form of maximum and minimum tariff which, as embodied in the McCleary bill, now before Congress, is useful only for purposes of retaliation.

Municipal developments The Situation in in Philadelphia continue Philadelphia to attract general interest and to afford food for political philosophers. The domination of Durham, McNichol, and Penrose in the Republican organization has been terminated and a new leadership substituted for it through the agency of the Lincoln party, an organization formed during the recently concluded campaign to afford a single antimachine State and city ticket. The City party had only a local ticket. The Lincoln party column was used by nearly a hundred thousand voters, and was made the medium through which a large number of dissatisfied Republicans expressed their disapprobation with the "organization" Republicans. Since the election the Lincolnites have made a fight to secure control of the Republican machinery, and in this seem to have been successful, largely through the guidance of John M. Mack, a former political and business partner of Durham and Mc-Nichol. Mayor Weaver's attitude toward this reorganization of the Republican forces, or rather the new leadership, has been cautiously expressed in an interview. and it is generally believed that he voices the views of a large number of independent Republicans:

"What the independent Republicans of Philadelphia have been striving for," declared the Mayor, "was to regain the control of their party organization from the men who have for so long mismanaged the party and abused the powers they had usurped. If the Republican City Committee shall be rejuvenated by the election of clean, decent men, I think that will meet the approval of all

Republicans. For my part I shall be perfectly satisfied.

"It would seem to me, however, that a strong minority party would be necessary in order to insure the nomination of acceptable candidates by the dominant party in the years to come. It may be that a combination of some kind may be effected whereby the Lincoln party, City party, and Democratic party may be fused so as to hold the balance of power, and thus act as a check upon the Republican organization.

The City party has taken the position that in an exchange of bosses there is no accomplishment of any desired end, and therefore it declared that the Republican primaries held on January 11 were not "of the sort in which the victorious citizens of Philadelphia should in any measure co-operate." In a carefully prepared public statement the City party declared:

Recently the people have observed with regret political action on the part of office-holders, and those who aspired to ride into power through controlling them, exactly similar to the methods of the old discredited "Gang." That action of this kind has been without the consent of the Mayor, and at least some of his Directors, we sincerely believe, and we call upon them with confidence to prevent its continuance.

At the special election held on January 9 to fill vacancies in the legislative delegates, the Regulars and Independents divided honors.

(2)

In the new Capitol building Pennsylvania at Harrisburg began on Legislation January 15 the extra session of the Pennsylvania Legislature. The supplemental call which Governor Pennypacker issued enables the Legislature to consider more subjects than were originally contemplated. It makes possible legislation on uniform primaries, State Civil Service Reform, corrupt practices at election, and a Greater Pittsburg bill. In addition to these subjects the special session is authorized to deal with the following questions:

The safeguarding of the State funds and the securing of greater interest on deposits.

Legislative reapportionment. Personal registration.

Repeal of the Philadelphia "ripper."

The building of county bridges.

The abolition of the fees of the Secretary of the Commonwealth and of the Insurance Commissioner.

John W. Hill, former engineer in charge of the filtration plants, has been acquitted under the instruction of the Court, the Commonwealth having failed to make out its case. The result was somewhat in the nature of a foregone conclusion, as the charge was a highly technical one, difficult of proof and comprehension. Moreover, there was a feeling that he was being tried for the crime of others. The trial served, however, to bring out many important facts in connection with erection of the filtration plants.

The rising tide of popular The Niagara sentiment in favor of the Campaign preservation of Niagara Falls for all the people, instead of converting it into electric power for the enrichment of a thousand stockholders, more or less, bids fair to become a flood. In October last the American Civic Association, at Cleveland, by resolutions telegraphed to President Roosevelt and to the Governor-General of Canada. called attention to the rights of the whole United States under the Ordinance of 1787, and urged the appointment of a joint international commission for the preservation of the great cataract. work of stimulating public interest has gone steadily forward ever since, until scores of organizations throughout the country, and thousands of people, are bringing their influence to bear upon the President, the Congress, and the New York State Legislature, for the action appropriate for accomplishing the result. The interest of The Outlook in this ob-

ject has been many times expressed, and

is emphasized again in this issue by the

publication of an important article by

Mr. Charles M. Dow, President of the

Commissioners of the State Reservation

at Niagara. We commend this article,

which reviews in order the encroach-

ments upon Niagara Falls, and also the

work which has been steadily carried

forward for a score of years to check

these encroachments. The conclusions

which Mr. Dow arrives at are clear and

specific. The most important of these

conclusions is the necessity for "joint

action of the Government of the United

States and the proper British authori-

Action under the initiative of the President of the United States, through diplomatic channels; action by the Congress of the United States in accordance with the recommendation of the President in his recent annual Message; action by the Legislature of the State of New York looking toward an amendment to the State Constitution—all these are matters of immediate and pressing importance. In order to bring to bear the sentiment of all the people for the accomplishment of these ends, personal letters, the circulation of petitions, action of influential local bodies, the fullest discussion in the printed page, each will contribute to the hoped-for result. We firmly believe that the time is ripe for such action as shall make forever secure the scenic beauty of this greatest of American cataracts.

❷

The decree has gone forth Football in from the Board of Overseers Disfavor of Harvard that football shall be stricken from the list of intercollegiate sports at that university until it is reformed to their satisfaction. The committee whose report the Overseers adopted considers "the game of football as at present played essentially bad in every respect," and calls the game an "apology for a rough-and-tumble fight." Brave as this action appears to be, it is, in fact, a rather humiliating confession. These college authorities by their action have admitted that they have the power to control athletics, but that they have refrained from exercising that power until at last one athletic game has become insufferable; thereupon, just at the time when college representatives are uniting in a promising effort for reconstruction, these authorities, in a tone of unqualified severity, adopt a measure of prohibition. No better illustration could be imagined of the irresponsible attitude which college authorities in America have too often taken toward the social ethics of the undergraduate body. In the meantime the old self-perpetuating Intercollegiate Rules Committee and the new representative Committee chosen by the New York Football Conference have amalgamated and are vigorously

and conscientiously proceeding to revise the game. Necessary, however, as a revision of the game is, a revision of the spirit in which all college games are too frequently played is absolutely fundamental. Dr. S. Weir Mitchell, the other day, at the University of Pennsylvania, deplored with gentle humor the bitter rivalry and worship of brute strength and muscular skill which football had created. He recalled "our disputes and enthusiasms over the new writers like Tennyson, Dickens, Thackeray," and the days when he really saw "men enthusiastic about Socrates." One does not need to see the past in that golden light which Dr. Mitchell has a genius for kindling in order to admit that the spirit in which college men regard their sport is still far from lofty. As Mr. Charles E. Hughes pointed out at a dinner of Brown University alumni, the commercial spirit in sport at college means the fostering of the commercial standards which create bosses and insurance scandals. Beside this fact the mere roughness and danger of a game are of moderate importance. "It is with chagrin," said Mr. Hughes, "that the alumni of a college read the financial reports of the Athletic Committee and see that it came out fifty thousand dollars or so ahead at the end of the season."

8

Mr. Hughes's remark The Value of must be interpreted as College Athletics describing an ideal condition, for that same evening Yale men were cheering the statement that Mr. Camp, "the father of Yale football," had been quietly accumulating out of gate receipts a great surplus. This it has been declared will amount to \$130,000. These Yale men heard very favorable reports of the game as played by Yale teams. President Hadley told them: "Football is a major sport, like hunting or deep-sea fishing. . . . All too often we have had deaths from hunting or deaths from sailing, but during the thirty years we have played American Rugby football at Yale there has been no death, and, to the best of my knowledge, no grave case of permanent injury." gave them also sound advice: "To say

that a man means to play unfairly and then keep on playing with him is not the act of a gentleman, I am convinced that if every American college student and graduate would see that it was his duty as a gentleman to attribute honorable intentions to his opponent as long as he accepted him as an opponent, the worst causes of irritation would be At the Brown University avoided." dinner President Faunce also had this testimony to give on behalf of athleticstestimony which, so far from lessening any zeal for the reformation of football, ought to give to the work of such reformation a new importance and value:

As much as I deplore the injuries that result from football, I say that they are of little account compared with the enormous social benefits it has brought about. I believe the present rules must be changed, not, however, to make football as innocuous as dominoes or The harm lies, not in the roughauthors. ness and the danger of the game, but in the fraud and deceit that surround the contests as now conducted. The buying up of men, the deliberate breaking of the rules of the game—these are the real evils that eat out the heart of student character. I firmly believe that we ought to have one "rough" game in college—one game in which men come into personal conflict with one another. When people are now denouncing the game of football, the old drinking and carousing of a generation ago, the smashing of windowpanes and the destruction of property characteristic of that time, are forgotten. These things are unknown in college to-day, and it is a direct result of the rise of athletics, especially football.

This widespread and apparently undiminishing discussion of football is thoroughly wholesome, for it impresses upon people the fact that the question of college athletics, as President Faunce in this same speech said, "is not a question of physical benefit or damage"—except, if we may interrupt, incidentally; "it is a much larger, broader question; it is a question of social or of moral benefit or damage."

•

Marshall Field An American merchant of the highest type, Marshall Field, of Chicago, who died last week in New York City, left behind him a business and personal reputation in which may be found both a commendable example and a salutary contrast. Large as were the interests he

controlled and great his opportunities for financial power, he abstained from speculation, from those gigantic schemes of foisting upon the public great blocks of inflated securities which have made the phrase "high finance" a byword, and from using trust funds for secret or personal ends. Beginning as a clerk in a general store, he rapidly pushed his way into mercantile enterprises and built up a commercial house of such magnitude that he is said at the last to have had more than five thousand The great persons on his pay-roll. Chicago fire of 1871 found Mr. Field's firm doing a business of \$8,000,000 a year, and, severe as was the blow, that business was in a few years doubled and quadrupled, until now it is said to be at least eight times that sum. To carry on, or direct even in the broadest way, such a business was the work of a man of splendid executive ability, firmness of purpose, and soundness of judgment. All this Mr. Field undoubtedly was, and apart from his mercantile affairs he was a power for good in the commercial and banking world. A Chicago banker is quoted as saying: "He has prevented more small failures and done more to keep the methods of trade in the West toned up to sound business principles than any other man." One of Mr. Field's last financial achievements was the proposal of a simple plan for averting the panic threatened by the impending failure of the Walsh banks. Others had striven in vain over the problem, when a few words from Mr. Field opened a clear and safe way out. Among the maxims upon which Marshall Field built up his commercial career were these: Never give a note; never buy a share of stock on margin; do not speculate; do not borrow; do not encumber a business with mortgages; do business on a cash basis. Personally Mr. Field was of calm temperament, quiet, unostentatious, and of simple habits. He was interested in public affairs, always supported honest city government, and advocated a broadminded public policy. Among his more notable benefactions were those to the University of Chicago and to the Field Columbian Museum, which he founded as a permanent memorial of the Chicago

World's Fair. Altogether Marshall Field was a most encouraging and stimulating illustration of the fact that wealth may be honorably and legitimately acquired without wrongdoing or sharp practice.

"The First American"

The ninety-seventh anniversary of the birth of Lincoln suggests the near approach of the full round of a century since "the first American" opened his eves in the rude frontier cabin in Kentucky. In a century rich in great men and in illustrious careers in every field of thought, knowledge, art, and practical endeavor, it is safe to say that no man has gone farther than Lincoln in securing and holding the kind of fame which is happily compounded of admiration for commanding ability and service and of affection for tenderness of heart, sweetness of nature, and beauty of spirit. For among the many strange mutations of condition and reputation connected with Lincoln there is none more extraordinary, when his circumstances and appearance are recalled, than the deepening perception of a certain rare beauty in the man's personality; a harmony between high ideals, speech, and conduct which, now that the mists of misconception and the black clouds of the passion of his time have passed, throws about his gaunt and uncouth figure a soft radiance. Aside from his heroic struggles with and victories over adverse conditions, and apart from the vindication of his ideas and policies as a statesman, there was something in Lincoln's nature which has evoked a feeling of tenderness. a depth of affection, which have gone out to no other President. The country not only reveres the memory of Lincoln: it loves the man.

As the years go by, the largeness of his vision—of so much greater reach than that of the public men with whom he worked or who worked with him—is matched by the greatness of his soul; and time has distilled from his worldwide reputation a finer and purer fame. Amid the pitiful meanness to which public men often stoop in the bitter and corroding jealousies of political life,

which baffle the plans and waste the strength of constructive statesmen, Lincoln's magnanimity, patience, forgetfulness of self, and saving grace and sanity of humor make him a man apart from the moral egotists, the harsh radicals, the pliant politicians of his period. The country thinks of him as of a great, tender human soul, solitary by temperament and by the conditions of his life. carrying the sorrows not of a section but of a whole people on his heart; called to rule over a divided household and never for a moment forgetting that it was still a family though dissevered, and bearing in all those bitter years neither hatred nor the spirit of strife. but a heart of compassion for those who opposed as for those who sustained the Government.

Now that the field of struggle lies clear in the light of memory, and the Blue and the Gray are honored alike in all the celebrations of courage and devotion, the spiritual prescience of Lincoln grows more distinct and commanding. Dying on the threshold of the new day, with the passions of an age of deep and radical misunderstandings still hot about him, he was the prophet of a future now happily become a living present. When, a few months ago, the President of the United States, standing at the base of the Lee monument in Richmond, said to the little group of veterans in faded Confederate uniforms, "Come up nearer," he was not only speaking for the whole North, but, forty years after Lincoln's death, he was using Lincoln's voice and fulfilling Lincoln's purpose.

The President of a section by force of a passing disintegration, Lincoln was always in feeling and spirit the Chief Magistrate of a Nation. In the light of later history not only does the beauty of his spirit reveal itself as one of the noblest possessions of the country, but the wisdom of his statesmanship becomes more clear. For it is love, not hate, which clarifies the vision, and a great generosity is a safer guide in public affairs than the most keen-sighted and calculating prudence. There were men of great ability about Lincoln, whose services and sacrifices cannot be overvalued, but he stands out separate and

apart from them all by virtue of a certain largeness which they lacked. Among men of sectional training and instinct and policy he was a man of National feeling and policy. Around his figure, now that the old passions are dead, the men who opposed him can gather with men who sustained as about a common leader, for he is neither of the North nor of the South, but of the country—" the first American."

Washington Gladden

The Outlook joins with his many friends in congratulating Dr. Washington Gladden upon his approaching seventieth birthday, on a life of service well rendered, and on National honor well earned. It is generally hazardous to print any estimate of a man while he is still living, but the transparency of Dr. Gladden's character and the simplicity and purity of his motives make such an estimate in his case without hazard.

The temperance movement in the second quarter of the nineteenth century, and the anti-slavery movement in the first decade of the second half of that century, turned the attention of men from a consideration of the other world to a consideration of this, from a study of theories about God to a study of what loyalty to him required of them in their lifetime—in brief, from the problems of abstract theology to those of practical ethics. Under this impulse theology was humanized. Religion came to be regarded as a normal development of all true manhood; the Bible as a transcript of human experiences; Jesus Christ as a man in whom the spirit of God supremely dwells; God himself, not as a mysterious being "without parts or passions," but as a Father with a sense of justice and of pity, interpreted by justice and pity in the souls of men. At the same time, and under the same influence, the Church became a more definitely philanthropic organization; the spirit of religion flowed out from the Church, which had been its too exclusive dwelling-place, into all life; politics began to recognize a "higher law;"

economics ceased to be the "dismal science;" sociology as a philosophy of human relationships and human progress was born; regeneration, conversion, atonement, sacrifice, all took on a new meaning, and became, so to speak, socialized; "election" became avowedly an election for service, not for personal salvation; and salvation came to include the reconstruction of human society into a kingdom of God on the earth.

No doubt this movement was accompanied, as such movements always are, with some grave defects. There were cases not a few in which the reaction against theology led to a superficial scorn of all profound thinking; theology, from being the grandest of human sciences, was relegated to the place abandoned by economics, and became the "dismal science;" chairs of systematic theology in theological seminaries took a second place; preachers became lecturers of moral reform; pulpits became lyceum platforms; churches became social clubs, animated by a mild and far from passionate philanthropy. Yet these sporadic instances need not deceive us as to the general trend of the times. Even outside so-called religious circles the humanitarian movement was reformatory and inspirational. Robert G. Ingersoll was the last of the assailants of institutional religion, and even his daring eloquence did not suffice to give him any real influence. The critics of orthodoxy had formed Thomas Paine clubs at the end of the eighteenth century; the same type of men formed societies of ethical culture at the end of the nineteenth. In lieu of wasting their energies in attacks upon the Church, they devoted them to competing with the churches in self-sacrificing service, and sometimes distanced churches in the heroism and the fruitfulness of their generous endeavors.

In this movement toward the humanizing of theology and religion Dr. Washington Gladden has been a leader. Editor, lecturer, author, preacher, he has always been a minister of the Christian life and a loyal servant of the Christian Church. He has taught a human theology, but still more has he preached a human religion. For his interest has

always bee' more in religion than in theology—that is, more in men than in systems. He has therefore used systems as instruments for the betterment of men; and not only systems, but no less the Church and the Bible. With Paul, he has believed that apostles and prophets and evangelists and pastors and teachers have all been given for no other purpose than to bring humanity unto a perfect manhood; and that the profit of the Bible lies in the fact that it furnishes men thoroughly unto all good works.

But if he has regarded all religious institutions as instrumental to life, he has also regarded all inspiration of life as derived from religion. He has not been a preacher of the Gospel and a moral reformer; he has been a preacher of a Gospel that is a moral reform. He has believed in a Christianity that is "glad tidings to the poor," and he has also believed that the only ultimate hope for the abolition of poverty, whether of mind or of body, is in the spiritual life to which that Gospel is a minister. mere glance at the titles of his books furnishes an illustration of these two truths, or rather of this twofold aspect of the one truth. His preaching has been "Plain Thoughts on the Art of Living;" Christianity with him is not a philosophy of life but a way of life—" The Christian Way;" he has not discarded the old nor dreaded the new, but taken with impartiality "Things New and Old" if they would serve his fellow-men; he has not feared to handle with courage "Burning Questions" lest he should be burnt; he has not discarded the Church because it is not the kingdom, nor has he confounded the two, but, recognizing both "The Church and the Kingdom," has measured the value of the first by its power to promote the growth of the second; the perfecting of that kingdom he has counted as the end which sociology should always keep in view, for in that kingdom is to be found the answer to the question what are the right relations between "Workingmen and their Employers" and between "Tools and the Man;" the only Christianity he has recognized is "Applied Christianity;" the only salvation one that includes "Social Salvation," and "Social Facts and Forces" he has reckoned as not less divine than creeds and rituals; yet social salvation is not all—he has always spoken to man as a child of God and heir to a divine destiny, albeit that destiny is to be attained not by thinking about it but by the "Practice of Immortality."

Dr. Gladden has been no celestial seraph looking down from afar on the battle of human duty and of human rights; he has been in the heat of the battle, and, like others engaged in that battle, his passion for righteousness has sometimes obscured his judgment. But his friends love him all the better. And friends and foes alike recognize that in him combativeness is not allied with destructiveness, that the inspiration of his courage is an unselfish devotion, and that he always fights fairly. He has unconsciously summed up his own life in that prayer which he has put into the mouths and inspired in the hearts of his comrades, and which interprets both his spirit to his age and the best spirit of the age to itself:

"O Master, let me walk with Thee In lowly paths of service free; Tell me Thy secret; help me bear The strain of toil, the fret of care.

Help me the slow of heart to move By some clear, winning word of love; Teach me the wayward feet to stay, And guide them in the homeward way.

Teach me Thy patience; still with Thee In closer, dearer company, In work that keeps faith sweet and strong, In trust that triumphs over wrong,

In hope that sends a shining ray Far down the future's broadening way, In peace that only Thou canst give, With Thee, O Master, let me live."

The Truth About the Congo

On the west coast of Africa there is a country known as the Congo Free State. Its sovereign is Leopold II., the King of the Belgians. With its government Belgium has no more to do than any other European Power. The only connection between Belgium and the Congo is that the monarch of the one is the "king-

sovereign" of the other. In the Congo Free State Leopold's will is law. He has been placed in charge of it by a conference of the Powers; in his person is embodied the government of that great territory.

For years the conviction has been spreading that the arrangement under which this State has been ruled has brought to the native blacks, not civilization, but desolation; that government there has meant oppression, murder, and outrage. So bitter has been the outcry against the Congo Government that a year ago last fall Leopold sent a Commission of three there to investigate and report its findings. The accusers of Leopold expected little from this Commission; they looked for a perfunctory examination and a verdict of not guilty. No culprit, they believed, would ever be convicted by a jury of his own choosing. Several weeks ago the report of the Commission was issued. Despatches purporting to epitomize the report seemed to confirm the expectation of acquittal. The Outlook chose to wait till it could see and study the report itself. We here give to our readers, as completely as space will permit, the findings of that Commission, and then leave them to judge whether Christendom is yet supplied with a reason for interfering in the Congo or not. In interpreting this report the reader should remember that this Commission, by the very nature of its origin, would report no evil or abuse of whose existence it was not most strongly convinced.

In that "sinister and mysterious continent" of Africa, the Commission declares that it has found a State which, "organized with marvelous rapidity," has brought there the "benefits of civilization." This State is the owner as well as the governing power of the territory. "There existed in the Congo," at the time the State was formed, "no private property in the sense which European laws . . . give to the word." Individual natives, that is, did not own land. The principle was then adopted: Unoccupied land belongs to the State; land occupied by natives, under the authority of their chiefs, shall continue to be ruled by local customs. Not only were the

native blacks thus forbidden to take what they would from the forest which they had formerly ranged with freedom, but even in their own villages and plantations they "could not dispose of the products of the soil except in the degree in which [dans la mesure où] they had disposed of them before the establishment of the State." Moreover, the native who went from his village without authorization laid himself open "to be arrested, returned, and, sometimes as well, punished." Since the only articles of value were the products, not of the villages, but of the forest, and the forest belonged to the State—that is, to Leopold—the natives possessed absolutely nothing of any use to anybody beyond their capacity to labor. The Government, however, must develop the country, and the natives must pay a tax. This double purpose, under these restrictions, could be accomplished in only one way. The natives must pay their tax in labor, and their labor must consist in bringing to the State the product of the State lands the forest. The natives, however, were disinclined to work. So they had to be forced to work. By this plan, the Commission argues, not only did the State get the rubber which it wanted and secure the taxes which it imposed, but the natives were given a chance to be civilized:

The native, left to himself, in spite of all the efforts made to instruct and enlighten him, will continue fatally to live in the primitive state in which he has been found for so many ages, and from which he does not ask to emerge. . . A law, then, which imposes upon the native light, regular work is the only means of getting him into the habit of working; it is at the same time a financial law and a humanitarian law.

The Commission reverts later to the justification of forced labor. It evidently regards it as needing very strong defense. In spite, however, of its theoretical arguments on behalf of forced labor, it comes to this conclusion regarding the effects in practice:

We have been impressed on verifying how little the contact with the white has modified native processes... The chikwangue is prepared to-day in exactly the same manner as twenty years ago—by processes incredibly rudimentary and defective. It is impossible not to be astonished at the disproportion

which exists between the manual labor utilized and the result obtained.

The State, however, does not collect this labor tax itself from its black "citizens." It "had not at its disposal the personal and the necessary resources to improve a vast territory;" so it has had to "make appeal to private enterprise." It had authorized certain companies "to exact from the blacks the rubber work, as well as other payments, and to use force for obtaining them." The Commission is frank enough to acknowledge the character of these companies; they are "commercial," and "are in pursuit of lucre, not of humanity or civilization." Moreover, the agents who fix the amount of taxes and who administer its collection, the Commission candidly says, "have a direct interest in increasing the produce, since they receive shares [primes] proportionate to the value [importance] of the products gathered."

This is the condition of affairs reported by his Majesty King Leopold II.'s own Commission. Propertyless blacks, confined in isolated villages, forbidden to gather for themselves the fruits of the forests with which they are surrounded, forced to bring in rubber, copal, wood, fish, chikwangue, etc., as a tax, for which they are paid, not what the produce is worth, but what the agent of a moneymaking company decides he will give for the labor, subject to punishment if they fail to bring in the tax—these African natives are thus enjoying the "benefits of civilization."

In order to enforce its rules, the State, and the companies under authority of the State, employ sentries. These are of two kinds, so the Commissioners say some to protect the posts, some to act as spies and executioners in the villages. "The black man armed," the Report says, "when left to himself, feels welling up in himself the sanguinary instincts which the strictest discipline can hardly restrain." "There is," it also admits, "no more terrible tyrant than a black when set over other blacks, when he is not restrained by the ties of race, family, and tradition:" and it is over an alien tribe that such a black, according to the Commission, is set. We cannot be surprised to learn, therefore, that "brutality" has been in some places "the rule habitually followed." "These sentries," we learn again, "set themselves up as despots, demand the women, and food, not only for themselves, but for the crowd of parasites" who surround them; and "they kill without pity all those who make a show of resisting their demands and their whims." The Commission had visible testimony to the mutilation of the living and the dead. It describes the condition in Upper Congo as a "deplorable confusion between a state of war and a state of peace."

And what is the nature of the work for which the Commission says the negro has "special aversion," and to which the Commission says he is driven, at least until the last few years, by "the taking of hostages, the imprisonment of chiefs, the stationing of sentinels or 'capitas,' fines and armed expeditions"? We can turn to the Commission's report and read our answer:

The decree fixes at forty hours per month the work which each native owes to the State. This time, considered as a maximum, is certainly not excessive [exagéré], especially if one takes account of the fact that the work ought to be remunerated; but as in the immense majority of cases... it is not precisely the work which is demanded of the native, but rather a quantity of products equivalent to forty hours of work, the criterion of time disappears in reality and is replaced by an equivalent [equation] established by the Commissioner of the district after diverse methods...

Chikwangue (kwanga) is nothing but manioc bread. . . . The preparation of this food requires many operations: the clearing of the forest, the planting of manioc, the digging up [extraction] of the root and its transformation into chikwangue, which comprises the operations of separating the fibers and stripping the bark, pulverizing, washing, making it into bundles, and cooking it. All these operations, except clearing the land, fall to the women. The chikwangues so prepared are carried by the natives to the neighboring post and served for the food supply of the personnel of the State—soldiers and laborers. . . .

As the chikwangue keeps only a few days, the native, even by redoubling his activity, cannot succeed in freeing himself from his obligations for any length of time. The requirement, even if it does not take all his time, oppresses him continually by the weight of its recurrent demands, which deprive the tax of its true character and transform it into an incessant corvete. . . . Doubtless the adage, "time is money," cannot be

applied to the natives of the Congo; . . . it is none the less inadmissible that a taxpayer should be obliged to travel over ninety-three miles [150 kilomètres] to carry to the place of collection a tax which represents about the value of twenty-nine cents [fr. 1.50]. . . .

Natives inhabiting the environs of Lulonga were forced to journey in canoes to Nouvelle-Anvers, which represents a distance of forty to fifty miles [70 à 80 kilomètres], every two weeks, to carry their fish; and taxpayers have been seen to submit to imprisonment for delays which were perhaps not chargeable to them, if we take into account the considerable distances to be covered periodically to satisfy the requirements of the tax. . . .

The missionaries, Catholic and Protestant, heard [as witnesses] at Léopoldville, have been unanimous in describing the general misery which reigns in that region. . . . Without sharing entirely these pessimistic estimates, one can admit that they comprise a ground of truth. . . This remark is general; it applies to all the large posts of which we have considered Léopoldville as the type. . . .

The bearing of burdens is, beyond contradiction, of all the forms of labor tax, that which weighs most heavily on the native. . . . The traveler, to traverse the country, the trader, to introduce his merchandise, the State, to supply its personnel with food, to transport its material, and to carry the products out of its domain, have no other resource but to organize the bearing of burdens. . . In the two regions [which the Commission studied] . . the quantity of burdens to be transported is enormous, and the population, on the other hand, is relatively thinly settled. . . .

It happens that the Commissioners of the district engage, notably for work in agriculture, children from seven to eight years of age, who are bound for several years, by virtue of a contract which they have perhaps accepted voluntarily, but of which they probably were unable to understand all the import. According to the instructions of the Director of Justice, however, the officials . . . could not refuse their approval if the children declare they accept. . . .

This is the labor imposed on men, women, and children. Confined to their native villages except when driven into the forest to work out their taxes, deprived of all chance to own property or to trade, tyrannized by hostile blacks, in peril of losing hand or foot by the cruelty of a sentry, threatened with the lash, in danger of bullets from rifles, practically denied all succor except such as they can obtain from missionaries, the inhabitants of the Congo, it is not surprising to learn, have succumbed in such large numbers to fear and have fled, or to disease, to the lash, and to the

rifle, and have died, that the Commissioners remark: "If we accept Stanley's data, it is certain that a large part of the population must have disappeared." This is the picture of the Congo drawn, not by enemies of Leopold, but by his own Commissioners.

It is the boast of the Congo Government that it has abolished slavery as such, and kept the natives free from the ravages of alcohol. To these facts the Commissioners point with pride. They make some recommendations. King Leopold has now chosen a Commission of fourteen, ten of whom have been connected with the Congo Government, to study this report and to formulate practical measures for putting its proposals into execution.

Is this condition, described as it is by friends and not by foes, such that Christendom can endure it calmly?

The Colorado Experiment

There are two arguments for woman suffrage. The first, that it is a natural right, like the right to life, liberty, and the pursuit of happiness. He who holds this view does not regard consequences. Let justice be done though the heavens fall. Such advocates will read the article on another page on the Colorado experiment with impatience, or not at all. In fact, however, our whole American system assumes that suffrage is not an absolute and unconditional right. Whatever age one has reached, and however long he has resided in a district, and whatever his intellectual or other qualifications, he is entitled to have his property and life protected by the law. But in every American community his right to vote is conditioned on his age, his residence, the length of time he has dwelt in America, and in many American communities on intellectual and property qualifications. There is no more a natural right to vote in a general election than in a legislature. The question who shall vote is one which is determined by each community for itself, and is to be determined by the proved or

probable effect of the imposed conditions upon the welfare of the community.

The other argument for woman suffrage is that, if it be granted, it will purify our politics, abolish corruption, put an end to repeaters, secure just and equal laws; in brief, assure a general political house-cleaning. Will it produce these results? The answer to that question is to be found in the answer to another. Has it produced these results? What the results of the experiment have been in Colorado our contributor tells in his account of the Colorado experiment. His accuracy is vouched for; his judicial spirit is evident; he is neither an advocate for nor against woman suffrage; his own opinion is not expressed; and though we may surmise what it is, we do not know. To all open-minded readers whose opinion on this subject is to be determined by facts, not by theories, by the logic of history, not by the philosophy of either the sanctum or the drawingroom, we commend a careful reading of this article.

The Last Vigil

A well-known bas-relief represents an old man and woman replenishing a torch. In the stir and exhilaration of the lighting of the torches, in the joy of bearing them swiftly through the gloom, or watching them as they shine in the mist which lies on the highway of life, there is danger of forgetting those who have run the race and now, in weariness and often in great loneliness, are silently waiting the sinking of the fire of the torch. are out of sight and sometimes out of mind; for there is always an eager interest at the starting-point and an engrossing absorption in the running when the day is at its height; and there were once for these keepers of lonely vigils shouts of praise, and there were later the pain and strain of the race in its hardest stretches. For those whose faces are aglow with the earliest joy of the running, or are set with the stern resolution of those who have forgotten the applause and care now only to touch the goal, there wait the same quiet vigil, the same lonely watching of the sinking fire.

Tenderness and devotion to those who no longer press along the course are due not to age as a matter of timethe years mean nothing unless they bear the harvests of true living and store the granaries of experience—but to the race well run, the work well done, the pain and strife and sorrow bravely borne, the allotted task finished in faith and purity and loyalty. Blessed are they from whose hands the torch has not fallen nor the light failed in the long trial of will and heart and nerve! They have not only made the highway easier for those who come after, but they kept faith and hope in the nobility of the race and nourished the flame for those who are waiting to leave the starting-post or are questioning, in the bitterness of the long trial of strength, whether the race is worth running.

VIGIL

Youth for dreams, maturity for putting forth the spirit in the endeavor to realize them, age for the confirmation of the hope of their reality! In all the world there is nothing so beautiful as the figure of the spent and weary runner guarding with reverent and trembling hands the torch received long ago and borne with quiet faithfulness through the joy and the pain of the years. In the confusion of life, when men dash their torches to the ground and rush about in a frenzy of passion or a chilling stoicism or with denials of the nobility and reality of the race and the meaning of it on their lips. the faithful runners not only keep their own faith but the faith of others; peace and joy are in their guardianship, and they bear the common wealth of humanity in their hands and hearts. So One ran centuries ago and was derided and scorned and buffeted, and the light he bore was dashed to the ground; but in the agony of death he held it aloft, and, behold! the ends of the earth are lighted by it!

But when the race is over and the throngs have passed and the runner watches the sinking flame of the torch in solitude, there often comes a great The other runners, whose loneliness. feet once trod the same way and whose voices were friendly in the darkest gloom, have vanished into the great silence; the younger runners belong to other times and have other companions even when they are most tender and reverential; it is another world than that in which the torch was lighted, and there are no more voices that share and speak from the same depth of experience.

In the loneliest hour, however, the torch remains, and from the torch streams the light, however faint, in which the past, the present, and the future are held secure against the environing darkness. It is the witness of memory; in its radiance dear faces, now vanished in the morning light, shine as when the glow of youth was upon them; hours of happiness, moments by the way that were full of anguish and are now fragrant with the sweetness that comes out of sorrow borne with patient trust; years of brave endeavor and quiet fidelity to tasks and works; the peace which flows from service and the joy of remembered sacrifices—all these live within the circle of the flame.

There, too, faint but clear, present hope and task and reward abide: willingness to wait as well as to run, to be put aside as well as to be set at the front, to cheer the passing runner as well as to be cheered, to keep old loyalties fresh and sweet and old love young and pure in the daily renewal of memory, to stand fast as the shadows gather and to guard the sinking fire as loyally as one fed the rising flame.

So the soft light of memory and the narrowing glow within which duty reveals itself become the symbol of immortality. The darkness deepens, the world grows still, familiar sounds die into silence, upon the watcher falls the sense of isolation of those who wake while others sleep; and, lo! while the vigil is kept the gloom is shot with light, for at the closed window the light waits, and over the hills come the dawn. The vigil is at an end, and in the radiance of the morning the torch is extinguished.

THE AMERICAN FORESTRY ASSO-CIATION

FROM A STAFF CORRESPONDENT

AST week the annual Convention of the American Forestry Association took place in Washington. Its principal feature was the recommendation to Congress to amalgamate the present White Mountain Appalachian Forest Reserve bills now pending into one measure. The present bills provide for the purchase of National forest reserves in the White Mountains and the Appalachian Mountains, and authorize the Secretary of Agriculture to make contracts for the purchase of lands to amounts not to exceed respectively \$5,000,000 and \$10,000,000. The bill, as recommended by the Forestry Association, provides for a total expenditure of but \$3,000,000. This is done because of the conviction that Congress will only vote-at least at first-a small amount for these purposes. This very winter the last remaining vestiges of our primeval forests on the Presidential Range in the White Mountains are being ruthlessly cut

away; only here and there in the Franconia Notch and elsewhere in the White Mountain region are little dots of primeval forest left. To save these and to preserve the other trees Congress must act quickly, since the State of New Hampshire is not able itself to act in the matter. Nor should the State be asked to act beyond its financial resources. which are quite incommensurate with the demand. The preservation of the White Mountain forests is a vital necessity to other States besides New Hampshire. The water supply for those States should be the object of National concern. It is a satisfaction, therefore, to chronicle the action of the American Forestry Association, which, frankly recognizing existing conditions in Congress, has shaped a measure so as to insure its probable success at this session.

If dependence on a number of States be true of the White Mountain Reserve, it is emphatically so of the Appalachian Reserve. The territory covered by the latter reserve not only influences the water-flow throughout a larger number of States than does the former, but also, as now proposed by the new bill drafted last week, empowers the Secretary of Agriculture to purchase forest lands in the States of Maryland, West Virginia, Virginia, the Carolinas, Georgia, Alabama, and Tennessee. Of course, for the purposes of the reserve, the Secretary is empowered to purchase lands, exclusive of its timber thereon or of its mineral rights, and to provide for the reforesting of clearings on lands purchased, whenever he shall consider such action necessary.

During the year Ohio and Michigan have formed State Forestry Associations, and strong, wealthy associations exist in such older and larger States as New York and Pennsylvania. Like the smaller and poorer New Hampshire, however, no one of the Southern States seems as yet able to solve the forestry problem so as to conserve a supply of water as well as of wood, which is, of course, a matter of National, not merely of State, wealth. In an eloquent address before the Forestry Convention, Dr. Edward Everett Hale said that the present situation reminded him of Mrs. George Washington's oyster supper. In the matter of dredging for oysters in Chesapeake Bay no one of the colonies bordering on that bay was able to supervise or control the whole situation. But after Mrs. Washington had invited their representatives to a banquet, they discovered that what they could not do severally they could do by combination. The result of Mrs. Washington's oyster supper was the Constitution of the United States. Appalachian Reserve, proposed by the Forestry Association, contains our finest and most varied hardwood forest. No. individual State can establish the Appalachian Reserve, but Congress can, and, as Mr. Wilson, Secretary of Agriculture, said in his presidential address, the Association's proposals should have the immediate and active assistance of Congress. He deservedly praised the growth of an association which has about doubled its membership during the past year, and has now under its advisory

direction nearly nine hundred thousand acres of private land. In this connection Mr. Wilson repeated his warning of a year ago against the wholesale destruction of our woodland area. "No nation on earth is as successful in the work of destroying its forests as is the United States," he declared. The indiscriminate mutilation of our forests must be stopped. The matter has become of National interest. It can no longer be ignored. In view of the wide clearing of our timber lands, the one thing now to be done is, as Secretary Wilson says, to reforest the country. While "our great problem is how to plant the right kind of trees in the right places," "every day should be an arbor day."

That is a phrase to appeal both to common sense and sentiment. extravagant felling of vast numbers of trees for purely private interests often interferes with the general good. True forestry, however, is founded on continuous cutting, which in the case of the Government forests of Europe provides a steady revenue, the basic asset indeed of those Governments. A similar condition could be and should be brought about in this country. With the progress made in our Government western reserves, already reporting substantial profits, who can doubt that America will imitate Europe in this fundamental of sound economics, not to mention the preservation of noble scenery now being ruined? But the reserves are all in our The East should now receive attention. To this end the Association has drafted its new bill, recognizing at once the imperious demand for the preservation of wood and water supply, and the difficulty of obtaining an adequate appropriation at this session of Congress. The new aspect which the passage of such a bill would put upon agricultural and forestry conditions would have profound and permanent value. Will Congress heed this call to duty? It will if constituents, especially from the New England and Southern States, give their Congressmen no respite from appeal until this measure is passed. And may it prove but the entering wedge to really adequate legislative enactments l E. F. B.

CLÉMENT ARMAND FALLIÈRES

The newly elected President of France

WASHINGTON GLADDEN

From a photograph by Elmer Chickering, Boston

SIUZO AOKI

JAPAN'S FIRST AMBASSADOR TO THE UNITED STATES

BY WILLIAM ELLIOT GRIFFIS

OW that "all is peace under Heaven" and Nippon becomes once more The Country of Peaceful Shores, she signalizes her triumph by sending an Ambassador to "The Nation's Friend." The personal representative of the reigning sovereign, in the oldest dynasty in the world, will meet face to face the stalwart President of the American Republic, youngest among nations. It is not the least among her sons, or even an average man, that the Emperor has selected to represent Japan. Ripe in years, rich in experience as statesman and diplomatist, Viscount Siuzo Aoki is superbly fitted for his grand task of cementing anew and solidifying on larger and deeper foundations the traditional and (may we

not say?) the real friendship between the United Empire and the United States. As early as 1798 the American flag was mirrored in the waters of Japan, but it was Matthew Perry in 1854 who "discovered a new nation." Yet not to him, but to Townsend Harris, belongs the honor of discerning behind the veil of the Yedo bureauracy the true sovereign of Japan. Let us glance at history, in order to note the significance of the Ambassador's advent.

The subordinate authorities of Yedo sent an embassy, of courtesy merely, in 1860, which was composed of men of inferior rank. For seventeen years after the Perry convention Japan had no consul or diplomatic officer abroad to look after her interests. Her petty trade

was then of but cradle proportions. The Bakufu (Curtain Government) of the Tycoon, during these long seventeen years, was trembling for existence against the forces, then terrifically awakening, not of revolution but of restoration. But the moment a true national government took the place of feudalism and bureaucracy, Japan sent her initial representative abroad, and to the United States first of all.

The Junior Prime Minister and four members of the Cabinet, with over sixty elect commissioners—over half of them pupils of Verbeck—traveled six months in the United States; Ito reading "The Federalist" and Kido learning international law and studying constitutions. From 1871, by charges d'affaires, by ministers resident, and then by envoys plenipotentiary, Imperial and Constitutional Japan had a legation at Washington. All these were of appropriate rank, and some of marked abilities, such as Mori, the educational reformer, who first proposed the abolition of sword-wearing and fell martyr before the reactionary assassin; Yoshida, the brilliant financier; Terashima, the radical-conservative, who feared that Japan was going too fast; Kuki, later peer and now in the Privy Council; Takahira, the Peace Commissioner, and others. These, with many a brilliant secretary, naval and military attaché, formed the legation household in the edifice at 1710 N Street in Washington.

To-day Japan's few dollars' worth of trade have swelled to hundreds of millions. Her little budget of feudal fractions, once ground out of the people chiefly for the support of a privileged class, has now, in a library of ledgers, become a mighty proposition marching to the billion figure. Hers is the brown man's burden. Like all great nations, she wears the necklace of a national debt. Helmed and panoplied, she is the triumphant victor in four wars since the cannon thundered at Fushimi on January 27, 1868. The first victory of the brocade banner secured internal unity. The mighty insurrection of Saigo in 1877 gave Japan's new peasant army its fire-baptism and its victory wreath. In 1894 the red-rayed banner "flamed

in the forehead of the morning ky" to make a New Asia. The Murata rifle blew to atoms the Chinese doctrine of whang-ti or world-sovereignty, and showed what a public school army with modern science could do. In the fourth, in 1904-'05, a united people fought for food, for commerce, for national life, and the right to grow. The David nation, but vesterday in the wilderness with but a few sheep, laid low the Slavic Goliath. Now the world-power, Dai Nippon, sends a veteran and a victor in that thirty years' war, which she waged bloodlessly from 1870 to 1900, with untiring patience until she gained the world's recognition as an equal. won by the jū-jutsu of finesse.

Siuzo Aoki first saw the light in January, 1844, in Choshiu. His inheritance. therefore, was of civic abilities. The silver spoon in a Satsuma baby's mouth is that of assured success in arms. Ninetenths of all Japan's heroes on deck or in the field are from sea-girded Satsuma, that bore the brunt of the fighting in 1868, and then furnished the first four infantry regiments of the new Imperial army created in 1871. Choshiu is of age-old fame for giving birth to sons of the ermine and to children of the pen. Out of Choshiu came Yoshida Shoin. Kido, forefather of the Constitution, the Marquis Ito, Count Inouye, and many a long list of Japan's most distinguished statesmen, councilors, diplomatists. Aoki began early his appointed work in life, showing power of insight, grasp of details, and vision of the whole field. Apparently, to the writer at least, Japan does not trust green diplomatists, even though Aoki's name means "green tree." Indeed, no Japanese plant, tree, or flower is better known in Europe and America than the common aoki (Aucuba Japonica), which got to Europe during our Revolutionary War and is now seen all over central Europe and the United Behold the laurel-like shrub with purple flowers and red berries I Though exotic, it is capable of withstanding the dust, smoke, and gases of our manufacturing cities. This, let us hope, is a true emblem of Japan's ability, when transplanted from the age of art and idyllic seclusion into the Black Country of smoke and steam, to live, despite the withering influences of industrialism. Aoki soon made himself master of the German language—which Verbeck had already recommended as the vehicle of medical science in Japan—and in 1873 was made the Secretary of Japan's legation in Berlin, soon becoming Minister. He was made Viscount in 1884.

But the battle was waxing hot at home, and Aoki was wanted by Count Okuma, who was giving his whole energy to the work of treaty revision. Japan was determined to obtain recognition of her severeignty at the hands of European Governments. The United States had already been willing to grant it, but was hampered by the entangling alliance of a "concert" with European Governments. The routine of the whole department was in 1888 left to the care of the Vice-Minister, Viscount Aoki, who became full Minister of Foreign Affairs when the Ito Cabinet fell in 1889. On account of the attempted murder of the Czarevitch, now Emperor Nicholas, by a fanatic, Aoki resigned, but before doing so carried through a piece of work which was as high an honor to the United States as it was to the alien whose history, opportunities, dignities, and rewards are absolutely unique in the history of Japan. This was nothing less than giving to Guido F. Verbeck, Dutchman, American, Japanese, Christian missionary, but a man without a country, the privilege, with all his children, of coming under the powerful protection of the Empire of Japan, with right to travel freely through the Empire, and to sojourn and to reside in any locality; and this when Japan had no naturalization laws. It eventuated that Lord Salisbury and the British Government finally, because of our "entanglement," plucked the feather out of the cap of Washington and stuck it in the crown of Victoria.

Aoki was twice Minister in Berlin, and for a short while held the same office and duty in England. A thorough German scholar, he married, in the seventies, a German lady. The faces of both the Viscount and their only child, whose grief when ten years old over the injury to the Czarevitch is so vividly described by Mrs. Fraser in her Letters from Japan, are to be seen in that book. Grown to womanhood, the pretty little maid, married in Germany, is now the Countess Hatzefeld.

Aoki, as Minister of Foreign Affairs, held his post during the exciting days of the Boxer uprising, and his energies had much to do with the quick grappling with and rapid settlement of that difficult problem. Then, ceasing his diplomatic toil, he became a member of the Privy Council, the livest wire in Japan's electric machinery. Only the Privy Councilors have anything to say about treaties—at Portsmouth, Peking, or elsewhere.

As one of the early enlightened ones of the Meiji era, ever a true, patient, forceful leader, servant of the Emperor, and teacher of his people, richly deserving his rewards, Japan honors herself in Aoki. Americans, so quick to recognize ability, and remembering his courtesy to their fellow-countrymen, bid him hail any welcome.

HOW WOMAN'S SUFFRAGE WORKS IN COLORADO

BY LAWRENCE LEWIS'

LLUSTRATIONS of the practical workings of woman's suffrage have for some reason been sought in Colorado by both advocates and opponents, although women have voted upon equal terms with men in three other of the United States—in Wyoming since 1869, in Utah since 1895, and in Idaho since 1896. In New Zealand universal adult suffrage has prevailed since 1893. Yet most people regard woman's suffrage in Colorado as the type.

Let it be clear at the outset that the presence of "the ladies, once our superiors, now our equals," has had no especial effect upon the kind of order and decorum maintained at polling-places ever since the introduction of the secret or Australian ballot. Men possibly swear a little less, but they wear their hats and use tobacco as freely in all forms about the polls as ever before. In the best residence precincts in cities, and in most country precincts, the order is perfect. In some country precincts controlled by corporations (especially mining corporations), as well as in the lower wards and in precincts "on the border" in cities, thugs and election officials frequently clash; special constables, deputy sheriffs and even sheriffs, as well as policemen, often indulge in profanity, blackguardism, and intimidation. Ballot-boxes are stuffed and At the general election in Nostolen. vember, 1904, for example, the presence of women as voters and as members of election boards did not prevent a Republican "woman worker" from being

"thrown out" of a polling-place in Denver, literally "by the neck," and shoved up against a fence; it did not deter a County Commissioner in Pueblo-who has since been convicted of padding a precinct registration list with fictitious names—from introducing whisky at the polls in one of the corporation precincts. and getting the election officers, watchers, and workers drunk, so that repeaters could be "run in" and returns tampered with; it did not prevent fights, acts of intimidation, and the arrest of workers and voters of both sexes, of the opposite political faith, by partisan police and sheriffs' officers in various parts of the State; it did not prevent gross insults being offered, in a few cases, to women, nor avert murders at pollingplaces—a Democratic election judge in the Cripple Creek district being a victim. Although perhaps not as numerous. there are, nevertheless, in both parties. women as well as men repeaters and "election crooks." Challengers and watchers are as keen in seeking and as eager in taking advantage of technicalities to bring into question the right to vote of a woman of the opposite political faith as of any man. In deciding such cases the election judges consider partisanship and the law—not sex.

Analysis of a few of the many more important phases beneath these superficials may conveniently be made as answers to questions Coloradoans are often asked: "What and how many women vote?" "How do they vote?" "What change in the character and conduct of public officials has been wrought by woman's suffrage?" "What are the general results?"

Despite the efforts of both parties for their own selfish purposes to keep up the interest of women in political affairs, the ratio of female voters to male voters

¹ Mr. Lewis, the author of this article, was for several years correspondent for the Denver "News" at Pueblo, and has been Secretary of the Rocky Mountain Harvard Club. His personal standing and character and his familiarity with political conditions in Colorado are spoken of in high terms in letters received by The Outlook from several of the best-known and ablest citizens of the State. Mr. Lewis has been studying the workings of woman's suffrage in Colorado for several years.—The Editors.

seems to be decreasing. This is the unanimous opinion expressed to me by those officers in charge of the registration in the several counties whom I have The increase between 1892 and 1894 in the number of electors who voted for Governor was 87,227. Now, the interest at elections in "Presidential years" like 1892 has always been greater in Colorado than at the intervening biennial elections for Governor and State officers only, like that in 1894. Moreover, it is generally conceded that the population of this State actually decreased during 1894, owing to "hard times" and the sharp decline in demonetized silver. Consequently we may fairly assume that at least all of this increase of 87,227 represented the newly enfranchised women, who, on this assumption, composed 48_{100}^{19} per cent. of the voters in 1894. Figuring in the same way, the women in Pueblo, a representative county, made up 46_{760} per cent. of the total number of voters for Governor in 1894. These estimates correspond roughly with the but slightly different statement of William Macleod Raine. who says, in an article in the "Chautauquan," without giving authorities, that 47 per cent. of the entire registered vote of the State in 1894 was cast by women. The census of 1900 shows that women of twenty years and over composed at that time but 42_{100}^{53} per cent. of the total population of the State of twenty years of age and older. It would seem, accordingly, that when the suffrage was a novelty the proportion of women voters was slightly larger than the proportion of women in the total population of Colorado.

Unfortunately for purposes of comparison, no official separate record has been kept of the number of women and of the number of men who respectively have registered and voted. Names of both sexes are entered indiscriminately in the books. In order, so far as possible, however, to determine "what and how many women vote," I have checked over the official "registers of electors" and the "poll-books" in fourteen precincts of Pueblo County, which includes Pueblo, the second largest city in Colorado, with a present population, includ-

ing suburbs, of 50,000. I present on another page, in tabular form, the actual figures as to the number of women and the number of men who were registered and who voted, together with percentages. This table includes actual figures for each of the precincts for the election of November, 1904, for National, State, and county candidates, and in the case of eight city precincts it also covers the April, 1905, election for municipal candidates. Extraordinary general interest was taken in both campaigns and elec-Although registration for the fall election was "padded" by about a thousand fraudulent names in good as well as bad precincts in all parts of the city, and, as the courts have since shown, a conspiracy existed among gangsters to have "repeaters" vote under these names on election day, the active vigilance of good men, not women, of both parties, backed by a vigorous sentiment and by the courts, prevented much of the intended fraud. The municipal election last spring was regarded by politicians as "the most nearly honest election in Pueblo in years." I chose Pueblo County because in Denver, neither in November, 1904, nor for twenty years, has there been an election that decent citizens of either party would unhesitatingly assert was "anywhere near on the square." None of the other cities is thoroughly representative. The polyglot population of Pueblo County, however, and the great variety of industries in which her inhabitants engage, make it possible to select precincts that are representative of almost every class, nationality, and occupation within the State.

It is noteworthy that in a number of precincts the percentage of those registered who voted is higher among the women than among the men. This is due to the fact that women are to be found at their places of residence for a greater portion of the day, and consequently those women who are registered are, throughout the twelve hours the polls are open, frequently reminded of their duties by men and women precinct workers. In the best-managed municipal precincts every woman of both parties who has registered is reported as either "voted," "absent from city," or

otherwise "accounted for" to the precinct leaders of the respective parties by six o'clock an hour before the polls close. It is, of course, impossible to do this so systematically with the men who are away from home at work.

male relatives are artisans, small tradesmen, unskilled and skilled workmen of American citizen parentage, and who correspond to the best class of miners in our State. (See columns 10 and 12 for precinct No. 27.) These women, as

WOMEN AT THE POLLS

Scene at a polling-place in one of the precincts "on the border" in Denver, showing women workers in the foreground at the left. Each worker has a typewritten list of registered electors showing the politics of each, or at least a list of the registered electors of her own party. Under the direction of the precinct chairman, on election day they call upon the registered electors and bring many of them to the polls in carriages furnished by their party.

It will be seen that the lowest percentage of women among electors registered, as well as of women in the total who voted, is to be found among those whose

a class, take but little interest in the ballot, and many of them say they "do not consider it womanly to vote."

It is also significant to see how large a

HUSBAND AND WIFE COMING TO THE POLLS TOGETHER

These voters in the best residence section of Denver have come to the polling-place in their own carriage. An official of the Honest Election League is handing them circulars urging them to vote against one of the nominees for District Attorney.

proportion of the registered Slav and Italian women vote-they whose husbands and brothers are the unskilled laborers at the great steel works, precious metal smelters, and other large manufacturing plants, and who generally correspond to the inferior or foreign class of Colorado's miners. (See column 15 for precinct 20 in my table. Also Remarks.) It should not be overlooked also that the percentages, both for registration and voting, of these foreign women are higher than those for the wives and sisters of the skilled American mechanics and small tradesmen. (Compare columns 10 and 12 for precincts 20 and 27.)

It is evident from the table that the percentage of total registered electors who are women, and the percentage of the total number of actual voters who are women, do not for these recent elections approach either Mr. Raine's assertion or my own estimate for 1894, except in the best residence precincts. Too much credit cannot be given a majority of our very best women for the manner in which they have assumed

their responsibilities of the ballot. Indeed, one of the strongest arguments of the suffragists is based upon the fact that in the very best residential parts of our cities the number of women voters more nearly approximates the number of men than anywhere else. But the next highest percentage of female voters polled is to be found in the precincts of brothels and female "rooming-houses." (See column 12 for precinct 8 in spring election, also "Remarks" in table.) In no precinct does the number of women. registered electors or actual voters, exceed that of the men. The average of all is, however, far below the percentage for the whole State for 1894.

Men fail to vote at primaries and at elections because in the press of their occupations they "don't find time;" because they have neglected to register; because they have failed to inform themselves about candidates or issues; because they don't care.

Women are affected by all these causes even more strongly. For other reasons, furthermore, that do not influence men,

ENCOURAGING WOMEN TO VOTE

Women of the best residence section of Denver, Capitol Hill, leaving the polling-place in an automobile lent to one of the political parties by an enthusiastic supporter of its candidate for Governor. A worker who acts also as chauffeur is helping one of the ladies into the tonneau. The woman worker is on the front seat examining her list of electors to see for whom she will call next.

women do not do their duty: Because "they are glad to say they let their men folks attend to politics for their families;" because "their husbands don't want them to vote;" because of timidity and "not liking to go down into a horrid crowd of strange people and have their names called out in a public place." When but little over twenty-one years old, and especially when unmarried, some women do not vote because they prefer not to admit their age. In passing, it is worthy of remark that a gallant legislature, in reframing the law regarding registration to conform to conditions of woman's suffrage, made the provision that a man should be required to give under oath his exact age, but that a woman shall be required only to swear "she is over twenty-one years old."

In speaking of those women who do not vote, we should not overlook the sundry classes of good women who do vote—the "new women" who glory in "the redemption of the sex" and the assertion of their "higher place—in a

wider and nobler sphere than the kitchen or household;" the women politicians who, though not vicious, are "in politics for what there is in it in jobs and money;" the women, many of them newcomers to the State, who vote because they enjoy the slight excitement and novelty of casting their ballots; the women who "vote merely to oblige their husbands;" the women who "propose to assert their independence by voting just because their husbands don't want them to vote." Many examples of all these classes I have personally known, and also the greatest class of all, the good women, thank Heaven!-those who vote because they know it is their duty-and to many of them an unpleasant and unsought duty-because they feel that they must help to overcome the votes of the vicious and depraved of their sex.

But we have many bad women as well as good women, and experience and our figures show that, next to the best residence precincts, those containing the brothels and female "rooming-houses"

RIVAL WORKERS

The woman with the list in her hands is a precunct worker, and is telling the two women whom she has just brought to the polls, and who have just received the circular of the Honest Election League, to pay no attention to its attack upon the candidate of her party for District Attorney.

poll the greatest proportion of women voters. (See column 12 and remarks for precinct 8 in spring election.) Indeed, the hideous accompaniment of woman's suffrage has been the introduction into primaries of both parties, into registrations and elections in cities like Denver. Pueblo, Cripple Creek, Trinidad, and Leadville, of this far from small class of females from the "red light districts," who are more absolutely under the power of those who are supposed to be the guardians of the law than are the men of the same grade of immorality—the tramps, the saloon bums, the confidence men, the petty thieves, the keepers of low saloons, the gamblers, the pimps, the procurers. Owing to popular attention and indignation, warnings of newspapers, and the action of the courts, in neither of the elections that figure in our table did the police and county officers in Pueblo exercise as much coercion on these fallen women as has been the rule in elections in previous years in Pueblo and as is always done in Denver. Hence the percentage of women registered who voted is not as high as usual in precinct 8 of our table. Considerable coercion was used, however, in Pueblo in November, 1904. Even in April, 1905, despite the exposure by a grand jury of methods employed in the November and in former elections, some coercion was employed to compel women of the brothel precinct to vote once, although, apparently, there was no repeating last spring. Indeed, the figures

for the spring election show up conditions in the "red light district" more nearly accurately than do those for the fall election, when this precinct (precinct 8) included a considerable number of respectable alien workmen and their wives. It is safe to say that under ordinary conditions and under ordinary police administrations ninety per cent. of the fallen women in our cities are compelled to register and to vote at least once for the candidates favored by the police or sheriff's officers.

But in ordinary times these women are also compelled to "repeat." In Pueblo, in November, 1904, as before stated, the vigilance of the decent men of both parties, as special officers of the district courts armed with warrants for the arrest of persons who might attempt to vote under fictitious names, prevented a majority, but not all, of these thousand fraudulent names from being voted as usual by "repeaters" under direction of the police and sheriff's officers, who in turn were under orders from "the gang." A former "city detective" or "fine collector" in Pueblo has been tried, convicted, and sentenced to a term of years in the penitentiary for compelling an unfortunate woman to repeat her registration. He is under further indictments for compelling the same woman to forge fictitious names by the hundreds

to district registration sheets, all of which names were to be voted on election day by other fallen women, from whom the fellow collected "fines." Another former "city detective" is under indictment for actually compelling unfortunate women to repeat in the November, 1904, election, voting under some of the fictitious names forged by the first woman. Other presumably more respectable citizens, among them the present postmaster of Pueblo, the former county clerk and several of his deputies, are under indictment on equally strong evidence for being the brains and purse for this, which is but typical of former conspiracies by which elections were "carried" to perpetuate the control of the "gang."

Our foreign-born women electors, equally ignorant and illiterate with our foreign-born men, who as voters are so often held up for execration, should not be overlooked in our examination of "what and how many women vote." One of the anomalies of this woman's suffrage State is that an adult foreignborn woman is naturalized and becomes a duly qualified elector simply by the naturalization of her husband. An adult female alien applying for original naturalization is of but rare occurrence in Colorado. It can be readily seen that with this arrangement the naturalization of a single male alien often creates im-

Remarks.	Fart of this precinct is not in the city, but this part includes few." Mexicans." A few fraudulent registrations even here.		Next to precinct 4 above this is best residence precinct in city, but it includes more women who make their own living.		There were 8 fraudulent registrations (3 names of women, 5 of men) in this precinct.	-			_	all of American critizen parentage and correspond to the better class of our mining population.	-		Warrants were out for persons who might try to vote on 78 frauduent regretations (26 of women, 35 of men). This accounts for an unusually small percentage of those registered voting. Some fraud and coercion, however, in fall election.	Fights and trouble generally normally occur in this precinct. Owing to spring election being almost honest, the large part of the purchasable vote here was not got to the polls. Actual total women population is small here compared with men.	This precinct is not all in city for general elections, but includes some alten workmen and families. All fraudulent registrations were not found on account of difficulty of canvassing, but 13 (5 of women, 8 of men) were found.	This precinct in city election more of a fair criterion than in fall election above. Some respectable criteries on borders. Even in this election, however, police and county officers used corrot of the spring and fall. Few respectable women here.

mediately two foreign-born voters. The full significance may thus be realized of the fact, as reported by the grand jury in Pueblo, composed of leading citizens, six Democrats and six Republicans, that "nearly 1,300 foreigners received their naturalization papers during September and October, 1904, from the County Court (of Pueblo County)—within sixty days more naturalization papers to foreigners than had been formerly issued during the entire history of the county (covering over forty years). . . . In many instances they were issued to aliens who had never applied for their first papers. . . . These aliens, largely under the control of padrones or bosses, for a consideration from the political leaders, were rounded up and taken into court and demanded their naturalization papers, having all or part of their expenses paid by whichever political party could control the padrone." It is impossible to say just how many foreign-born female voters were created by the naturalization, in many cases through fraud, of these 1,300 male aliens, mostly of the lowest and most ignorant class of Italian laborers. Certainly it ran far up into the hundreds.

So much in answer to the question, "What and how many women vote." How they vote is a different matter.

Vicious women vote as the dominant "boss," aided by the police, or as the police acting on their own account, compel them to vote.

Foreign-born women—the Slavs and Italians, Greeks and Russians—like the foreign-born men, vote for the most part in the manner the superintendent of the railroad, mining, or manufacturing corporation, or his foreman or their agents, or the subsidized priest or padrone, tell them they must vote. These commands are sometimes reinforced by money, or by threats of bodily violence or spiritual damnation, or more often by threats of the kinsmen of the women losing their Women of this class as well as men are told to ask election officers for assistance-indeed, most of them need it—in preparing their ballots, on the ground that they do not understand the process of voting or that they are un-

HOW REGISTRATION IS "PADDED" IN THE RED-LIGHT DISTRICTS

This house, at 2116 Market Street, in the heart of the brothel district of Denver, had four legal resident voters; but from it twenty-three names were registered, the excess to be voted by repeaters on election day.

able to read or write English. In this way the intended secrecy of the Australian ballot is violated.

The "new women" vote for those who favor their pet theories.

Other women vote in various ways. Indeed, ridiculous but true stories could be told of how some really conscientious ladies vote. A few days after the election of November, 1904, for example, I was talking with a young married woman of more than average intelligence, who was living in one of the smaller cities of Colorado, and who declared "she never voted a straight ticket, because she always voted for the men." I applauded, and asked if she would mind telling me how she voted and why. "Not at all," she replied, earnestly. "I didn't know much about Roosevelt or Parker, but in his pictures Parker is much more handsome than Roosevelt, so I voted for the Democratic electors. I don't like Governor

Peabody's wife, so I voted for Alva Adams. The Republican candidate for County Clerk wants to marry a friend of mine and could right away if elected, so I voted for him. The Republican running for Assessor got my vote because he is a dear old man and needed a nice easy position. The Republican candidate for State Treasurer was a Swede and I don't like Swedes, so I voted for the Democrat. One of the candidates for County Commissioner on the Democratic ticket, they say, used to run a saloon, so I voted for the Republican. I voted against the Republican candidate for Sheriff because his wife got a divorce from him. I took my husband's advice regarding the other candidates, because I didn't know anything about them myself." I mildly asked if she knew of the special qualifications of any of these men to perform the duties of the several offices for which they were candidates. She replied that she had not troubled about that, because the reasons she had stated were sufficient for her. Of course this is an extreme case, but I have come to believe that the things which determined this really charming woman in her choice of candidates were of the kind that appeal strongly to many thousands of the women who vote in Colorado.

In rare instances wives vote differently from their husbands, but I have noted that in such cases politics is a source of more or less friction in the family. It follows naturally, however, from women's usual place in society, that they are not thrown into daily contact with men, and consequently do not have the same opportunities of learning at first hand of the character and capacity of candidates as do their brothers, fathers, husbands, and sons, who in comparatively small cities like those of Colorado (Denver's population in 1900 was but 133,859) are apt to know personally or by reputation the candidates in their daily work or business. For the proportion of women candidates for office in Colorado is very I believe it is not an exaggeration to say that, realizing these facts, more than half our women voters depend upon the judgment of the male members of their families in deciding how to vote.

Now, what change has been wrought by woman's suffrage, in the character and conduct of our public officials?

Women themselves form such a small proportion of the aspirants for any elective offices except those in connection with the schools that they are almost negligible factors. Ever since the extension of the franchise the State Superintendent of Public Instruction has been a woman. This is the office of greatest importance ever held in Colorado by our new voters. Be it said further to the credit of the successive incumbents of this responsible position that theirs has been about the only one of Colorado's administrative departments, from chief executive down, the conduct of which in the past decade has always been above even suspicion of rank favoritism, fraud, or graft. Since 1894 the office of County Superintendent of Schools has been held continuously in a number of counties by women. Their service, generally speaking, has been so eminently correct and satisfactory that after each election the proportion of women has increased until at present they hold this office in thirty-four of the fifty-nine counties. Women have also been elected to other county and city offices, but such cases have been rare and are growing rarer. A considerable number of deserving and competent women have clerkships and other appointive positions in various departments of the State and local government—possibly a slightly larger number than in men-suffrage States. Although citizens in every other sense, Colorado women, by custom, are not required to sit on juries nor pay the poll tax. Nor are they liable to service in the militia nor to call by the sheriff to act on a posse comitatus. As in cities elsewhere, those in Colorado have police matrons, but, with the exception of one special officer in Pueblo, no women policemen. There are a few women lawyers, but no women judges, although there is one woman justice of the peace in Kiowa, a cattle-ranch county. No woman has been elected to the State The number in the lower house of the Legislature shows a steady decline. In the session of 1895 there were three women members of the

House of Representatives; in 1897, three; in 1899, three; in 1901, one; in 1903, one; in 1905, none. It is a subject of common remark also that there has been in the last few years a steady falling off in the number of women at primary caucuses and as voters at partisan primaries in the respectable precincts, as well as a corresponding, and of course consequent, decrease in the

official capacities whose private lives were unsavory. We formerly had the elsewhere usual city average of saloon-keepers, some of whom were honest as municipal officials. Since the extension of the franchise to women political parties have learned the inadvisability of nominating for public offices drunkards, notorious libertines, gamblers, retail liquor dealers, and men who engage

ROUNDING UP REPEATERS

A city detective in a city of Colorado collecting disreputable women in order to "vote them" illegally and make them "repeat." The women are taken from polling-place to polling-place in closed carriages. As a "blind" the hack was not driven to the women's "houses," but the detective ordered the women to meet him and his carriage two blocks or more away. This picture was taken in spite of threats made by the "plain-clothes man" of the municipal police department that he would "do up" the photographer. He effectively concealed his own identity as well as that of one of the two women he was helping into the hack by "ducking" and holding up his hat. Two other women who were to go in the carriage are seen approaching on the sidewalk.

number of women delegates to local and State conventions of the parties.

A very noteworthy change wrought by woman's suffrage has been the raising of the requirement as to moral character, judged solely by their private lives, of men elected, especially to offices in our cities. But no corresponding change for the better has been brought about in the *public* conduct of our officials. Before 1893 we had in Colorado some men who served the people well in their purely

in similar discredited occupations, because the women almost always vote them down. This change has been pointed to by advocates of woman's suffrage as a great reform. Unfortunately, the character and honesty of our public servants, judged solely by their public services and by their official conduct, has not in general been improved. Since 1893 we have had as many men, possibly more, who as officers are incompetent, grossly partial, unscrupulous, and even

positively dishonest, although as private citizens they do not sell liquor or engage in riotous living. It should be needless to say that saloon-keepers are often honest, that ranchmen, real estate and investment brokers are sometimes dishonest, and that the substitution in office of a rogue who has been dealing in land for one who has been dealing in liquor is not a real improvement.

Now, what are the general results?

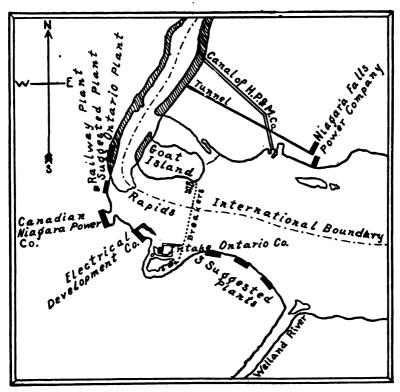

We have seen that the presence of women as voters has not improved the order and decorum at polling-places. addition to the specific crimes already mentioned, it will be necessary, in order to remind us how impure Colorado's elections have been, only to refer to the surprising amount of election knavery committed in all parts of the State by both parties in November, 1904, and exposed last winter in the contest over the Governorship, and to the facts that about thirty men in Denver, mostly Democrats, were sent to jail and fined, and that a grand jury in Pueblo returned 257 indictments, mostly against Republicans, all for election frauds.

Those of us who have lived in Colorado and have had the opportunity to become acquainted, not merely with the noisy radicals, but with our really representative women voters, are not ready to accept as accurate assertions that, as a class, they have by voting "dealt a blow at their womanhood," nor to approve sweeping indictments against their character and motives.

We have also seen that extension of the suffrage to women has, in the long run, merely tended to double the number of possible, not of actual, voters. Among the very highest classes, judged by standards of property, intelligence, and morality, and among the very lowest, we have added seventy-five to eighty-five per cent. to the number who formerly exercised the franchise. But among the great middle classes, in these respects, a very much larger proportion of the women than of the men do not vote. It would, indeed, appear that the average character of the actual voting body has either remained unchanged or has been slightly lowered as regards actual political intelligence and discrimination.

Although rascals of notoriously intemperate or licentious personal habits and rascals engaging in certain discredited forms of business are no longer so largely elected to public, offices, it must be confessed that in too many cases under woman's suffrage the incumbents are rascals still. We have practically all the forms of graft and misgovernment found elsewhere. Woman's suffrage seems to have been neither a preventive, an alleviator, nor a cure for any of our political ills. Furthermore, in Colorado's larger cities, and especially in Denver, lewd women have been granted by the police a degree of license not accorded them, so far as I can learn, in any other part of America. Is it unfair to assume that this is part of the price paid by bosses and police in our cities for the extreme activity of these women in primaries and elections? It would, however, be as absurd to assume that all the debauchery of our public service in many fields is due to women voters as to assert that they have improved our local and State government.

Indeed, it would seem that the woman's suffragists in general tacitly admit that there have been no practical reforms or other important or positive results in Colorado, because they who urged the adoption of their experiment for reasons of justice and expediency now in the great majority of cases praise its operation on grounds of justice only. Voting, they say, is one of woman's natural rights, from the exercise of which tyrannical man long prevented her. They ask, "Would you in justice refuse the intelligent and refined women of your family the franchise you give so freely to illiterates and miserable, often criminal, foreigners and negroes?" They assume that one approves of allowing the men of all these classes to vote without restriction, and they forget that these illiterates, foreigners, and negroes have women in their families. That all the women even of Colorado do not regard voting as among their "natural rights" is shown by the flat and oftentimes indignant refusal by many to vote at all, and by the manner in which such a large proportion of the others look upon voting as on unpleasant, irksome, and unsought duty.

NIAGARA FALLS AND THE NIAGARA RIVER Showing the location of existing and suggested power plants

HOW TO PROTECT NIAGARA FALLS

BY CHARLES M. DOW

President of the Commissioners of the State Reservation at Niagara

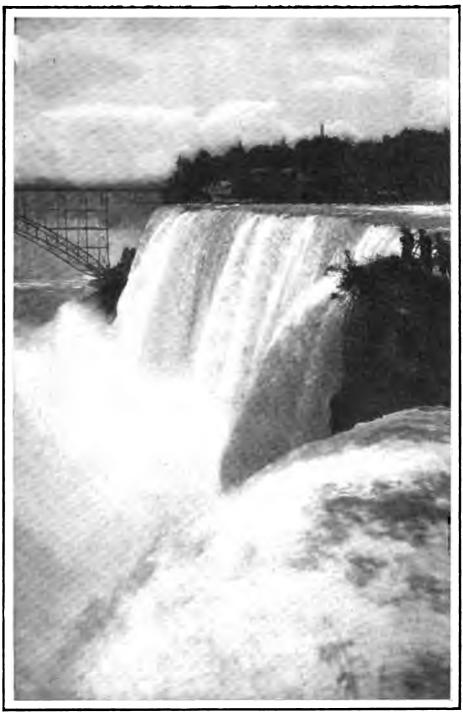

N the last week of the old year the following despatch appeared in one of the daily newspapers of the State of New York:

Assemblyman (Blank), when informed that Governor Higgins would have something to say relative to the preservation of Niagara Falls in his message, said he presumed there would be some play to the galleries along that line, but, notwithstanding, the utilization of natural water power for the production of electrical energy would continue all over the State and country, and in twenty-five years Niagara Falls would be as the Falls of the Mohawk at Cohoes, only to be seen as a waterfall on Sundays and holidays when the power utilization plants were not running and the diverted

water was allowed to follow its natural channels. For his part he thought it would be better to have the water thus used than forever running to waste.

This utterance is quoted solely because it accurately represents the feeling of large numbers of people. Coupling this feeling with the habit of capital to seize upon every opportunity for profit regardless of sentiments and emotions unconnected with the heaping up of wealth, we have a formidable menace to the Falls of Niagara, which, if not counteracted, will unquestionably bring about the result so much desired in the language quoted.

THE AMERICAN FALLS FROM THE SOUTHERN END AT THE NORMAL STAGE OF WATER

Compare this with the view on the opposite page, which was taken from practically the same point of view under quite different conditions

THE AMERICAN FALLS AT A LOW STAGE OF WATER CAUSED BY AN ICE JAM

A comparison of this picture with that on the opposite page gives
some idea of what will result if the Falls are not protected

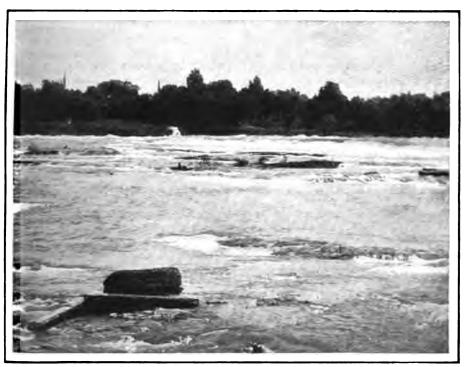

THE AMERICAN CHANNEL ABOVE THE FALLS AT A NORMAL STAGE OF WATER

This danger has recently aroused public attention and has stimulated into activity for the protection of the Falls the energy of the press, of several civic societies, and of a vast number of public-spirited citizens. The purpose of this article is to add to the exact knowledge of all such societies and persons, excite the interest of others whose attention has not been hitherto attracted to the subject, and to indicate in what manner protest against the threatened evil may be most practical and effective.

In the first place, the danger of the near extinction of the Falls as an object of overwhelming interest by the diversion of the waters is real. It has been difficult to impress this unwelcome fact upon the minds of a people whose imagination has been stirred for generations by the tremendous volume of the cataract, and to whom the inexhaustibility of Niagara has seemed as certain and enduring as the limitless power of the sun to give out heat and light. The volume of water in the river is a finite and measurable quantity. The flow has been measured for many years by the United States Engineer Corps, and it reports that the average flow of the river is 222,400 cubic feet per second, and that the minimum flow, so far as observed, was 165,340 cubic feet per second. Given this flow—and that the figures are substantially correct there is no doubt—we have next to inquire the amount of the abstraction of this water which has been authorized by the State of New York and by the Government of the Province of Ontario.

Upon the American side the State Reservation at Niagara, which is owned by the State of New York, occupies the shore of the river from a point below the American Fall to Port Day above the Falls, and although attempts have been made to procure the right to divert the water along this stretch of river front, all such attempts have hitherto been defeated. At Port Day is situated the intake of the Niagara Falls Hydraulic Power and Manufacturing Company. This company conducts water by a canal extending through the city of Niagara Falls to the brink of the gorge below the falls, and utilizes the water at the gorge.

THE RAPIDS SHOWN ON THE OPPOSITE PAGE, AT A LOW STAGE OF WATER

It is authorized to take water through a canal 100 feet wide with the uniform depth of 14 feet. The precise amount of water which can be diverted through this canal has not been accurately determined, or, if thus determined, has never been made public. The amount has usually been assumed to be 7,700 cubic feet per second, but in response to a question of the International Waterways Commission, the president of the company has said that the flow would be from 8.000 to 10,000 cubic feet per second. It is reasonably safe to assume that the maximum figure—10,000 cubic feet per second—is substantially correct.

Next above this canal is located the plant of the Niagara Falls Power Company. This company has the right to divert water sufficient to produce 200,000 effective horse-power. At the present time this company diverts the waters of the river into a canal communicating with penstocks in which are located the wheels producing power, and the waters are conducted through a tunnel approximately 7,000 feet long to the gorge of the river below the Falls. It has two

power-houses in operation capable of producing 100,000 horse-power, and the waters necessary to divert for this purpose are rated at 8,600 cubic feet per second. In order to produce the additional authorized 100,000 horse-power. the construction of another tunnel would be necessary. To produce this amount of horse-power would require the diversion of at least 8,600 cubic feet of water per second, and hence the total amount which this company is authorized to divert amounts to 17,200 cubic feet per This, with the maximum of second. 10,000 cubic feet diverted by the Niagara Falls Hydraulic Power and Manufacturing Company, makes a total of 27,200 cubic feet per second which can now be lawfully diverted upon the American side.

In addition to the foregoing, the State of New York has authorized from time to time during the past twenty years a variety of companies to divert water from the river, but several of these have unquestionably lost their rights through failure to comply with the time limit prescribed by their charters. There are two such companies, however, the legal

status of which is somewhat uncertain, viz., the Niagara Power and Development Company and the Niagara, Lockport, and Ontario Power Company. No statutory restriction was placed upon the amount of water which either of these companies was authorized to use. There is some question whether the rights conferred upon them are now in existence, but this can only be settled, if it ever arises in a practical way, by legal adjudication. It is understood that neither of these companies is at the present time engaged upon any work looking to the diversion of water.

Passing now to the conditions existing upon the Canadian side of the river, there are four corporations in operation which have been authorized by the Government of Ontario to divert water for power purposes. The Canadian Niagara Power Company has the right to use 100,000 horse-power, which, it is estimated, requires the diversion of 8,900 cubic feet of water per second. Ontario Power Company has two rights -one to carry water through three main feeder pipes eighteen feet in diameter to a power-house situate below the Falls, and the estimate given by the Canadian authorities as to the amount of water which will be diverted by these three pipes is substantially 12,000 cubic feet per second. This company has also a right to conduct water from the Welland River, which flows into Niagara River just above the rapids, but the amount of water which can be abstracted under this permission has never been determined and may probably safely be omitted from any calculations made in this article. The Electrical Development Company has the right to produce 125,000 horse-power, and the estimated amount of water required to produce this maximum amount of power is 11,200 cubic feet per second.

In addition to the foregoing, an electrical railway company has the right to divert water to a certain amount in the operation of its road, which amount, however, is quite small, and is generally estimated at about 400 cubic feet per second.

These are all the rights which have been granted by the Government of Ontario up to the present time.

In the year 1903 the Government of Ontario procured a report from an eminent hydraulic engineer upon the possibility of additional plants capable of generating electric power on a large scale with waters of Niagara River. The report of this engineer suggested four additional plants with a total water consumption of 29,996 cubic feet per second—practically 30,000 cubic feet. One of these suggested sites was located near the Horseshoe Falls, and the remaining three on the shore of the river above the rapids and below Welland River. The sites of all the existing and suggested plants are shown upon the accompanying

The present situation may, therefore, be summed up as follows, the figures given being that of cubic feet of water diverted from the stream each second:

AUTHORIZED DIVERSION

Niagara Falls Hydraulic Power and	
Manufacturing Company	10,000
Niagara Falls Power Company	17,200
Canadian Niagara Power Company	8,900
Ontario Power Company	12,000
Electrical Development Company	11,200
Electric Railway Company	400

SUGGESTED DIVERSION

30,000

The right to divert 60,000 cubic feet per second is an accomplished fact. The prevention of future diversions is the end to which the energies of all lovers of the Falls must be directed.

A clear understanding of the situation can be had only by careful consideration of the effect of the authorized diversion of the waters. Much speculation has been indulged in on this subject without full consideration of the topographical features. It must be borne in mind that the Falls consist of two parts—the American Fall and the Horseshoe Fall. division of the waters of the stream to supply these two falls occurs above the head of Goat Island. There has been a considerable diversity of opinion as to the proportion of water passing over the American Fall. It has been stated as low as ten per cent, and as high as twentyfive per cent. A careful consideration of the situation will, I think, establish that this percentage cannot well exceed ten per cent. A cross section of the stream based upon actual soundings just above the head of the rapids, taken in connection with the width of the American channel at the head of Goat Island and that of the Canadian channel at the same point, seems to establish that ten per cent. is a fair and reasonable estimate of this amount.

The power plants upon the American shore are both in operation, and it is safe to assume are now taking from the stream not exceeding 15,000 cubic feet per second. They unquestionably use to some extent water which would flow over the Canadian Fall, and it may be stated without fear of successful contradiction that the effect of taking a limited quantity of water from the stream above the rapids at any given point situated a measurable distance from the point of diversion cannot be calculated or stated with accuracy.

We have next to consider the effect of the abstraction of water by the plants already authorized upon the Canadian It will be seen by reference to side. the map that all of these plants divert water from the stream below the head of the rapids. These rapids extend for a distance of about three-quarters of a mile above the Horseshoe Falls, and the fall in this distance is about fifty-five At the head of these rapids is a large breaker extending from the Canadian shore toward the head of Goat Island, creating a cascade of several feet, and it is apparent that the taking of water from the stream below this cascade will not divert water to any appreciable extent, if at all, from the American channel. Hence, all power plants now authorized upon the Canadian side to take water to the extent of 32,500 cubic feet per second will not affect the American Fall, but only the Horseshoe Fall.

Three of the suggested plants upon the Canadian side to be situated between Dufferin Islands, which are substantially at the head of the rapids, and Welland River, will take water from the stream above the rapids, and will, therefore, to a greater or less extent affect the American Fall.

The fourth suggested plant, with a capacity of a little upward of 7,000 cubic feet per second, is located below the head of the rapids near the Horseshoe Falls. With the exception of this suggested plant, the river front between the crest of the Horseshoe Falls and the head of the rapids is now entirely occupied for power purposes. It is possible, however, that the capacity of the Electrical Development Company plant can be doubled, this increasing the suggested diversion, affecting the Horseshoe Falls alone to about 18,000 cubic feet per second.

Some detailed figures may here be profitably considered. The average flow of the entire stream being 222,400 cubic feet per second, the amount passing through the American channel will be on the average about 22,000 cubic feet per second, and through the Canadian channel about 200,000 cubic feet per second. The authorized diversion from this latter channel below the head of the rapids is 32,500 cubic feet per second, or about one-sixth of the total average The authorized abstraction is a fixed quantity, while the flow of the river varies, and we must, therefore, take into consideration its minimum flow. Upon the assumed basis of nine-tenths passing through the Canadian channel, the minimum flow is 152,406 cubic feet per second, and of this the authorized diversion is 32,500 cubic feet, or about twentyone per cent, of the minimum flow. This will be the result when companies with plants now constructed or in process of construction have come into full operation, and a result which cannot be avoided by any known means. It needs no argument to show that this authorized diversion will seriously affect the Horseshoe Falls and make imperative the most strenuous efforts to prevent their further depletion.

The effect of taking water from the river above the head of the rapids cannot be so accurately calculated. The average flow through the American channel upon the assumed basis of one-tenth is about 22,000 cubic feet per second, and at the minimum stage the flow will

be about 16,900 cubic feet per second. The entrance to this channel at the head of Goat Island is only a little over 700 feet in width, while the length of the crest of the fall is nearly 1,100 feet. Therefore a slight reduction in the depth

that even at the minimum flow of the river the appearance of this fall is most seriously affected. But few photographs have been taken at low water. Those in existence demonstrate that the majesty of this fall and of the rapids above it is

THE CHANNEL BETWEEN GOAT ISLAND AND ONE OF THE THREE SISTERS ISLANDS AS IT USUALLY LOOKS

of the water at the entrance to the channel will seriously affect the appearance of the volume of water flowing over the crest. No accurate survey of the channels in the river sufficient to determine the effect upon the American Fall of a diversion upon the Canadian side has yet been made. It is certain, however, practically annihilated with the water at the lowest observed stage. Any further abstraction of the water above the head of the rapids must unquestionably, during the lower stages, result in the destruction not only of the beauty but of the sublime power of this most magnificent fall.

The foregoing review of the actual conditions now existing warrants the following summary:

1. No further diversion of water on the American side below the plant of the Niagara Falls Power Company can from the stream above the plant of the Niagara Falls Power Company, which would involve such great expense in carrying water to the gorge below the Falls that capital is not likely to undertake the scheme until the more profitable

THE CHANNEL SHOWN IN THE OPPOSITE PICTURE, AT A LOW STAGE OF WATER

be had without occupying the river front within the bounds of the State Reservation, and it is not in the least degree probable that consent for this can be obtained from the Legislature of the State of New York.

2. Additional power plants upon the American side must take their water

sites upon the Canadian side are occupied.

- 3. That there are at least four sites upon the Canadian side below the Welland River where water can be diverted with as favorable financial results as at the plants now existing.
 - 4. That because of these facts further

diversions of water are likely to take place first upon the Canadian side, and for this reason efforts to prevent such diversion must be directed to the Canadian authorities.

In his Message to Congress, December 4, 1905, the President of the United States directs attention to the question now under discussion, and says: "If the State of New York cannot take care of the Falls herself, it is earnestly to be wished that she should be willing to turn it over to the National Government."

This is a startling suggestion, and the source from which it proceeds demands that it receive careful consideration. It is apparent that the State of New York is not likely to turn over whatever rights it may possess to the General Government in order to prevent the State itself from further depleting the waters of the Falls. If it is the desire of the people of the State that the Falls should be preserved so far as possible in at least their present condition, they will undoubtedly continue to refuse to divert the waters, and will not turn over the Falls to the General Government for the mere purpose of preventing themselves from working the devastation. Unquestionably the only power that the State of New York possesses is to refuse to permit further diversion of water on its side of the stream. It cannot in any manner control the diversion on the Canadian side, nor can it enter into any agreement with the Canadian Government that the latter shall prevent further diversions.

It is also apparent that if there is any power to negotiate with the Canadian Government upon this question, it now resides in the General Government; and that any cession from the State of New York to the General Government would not increase that power. It is, therefore, not apparent what practical effect for good would be had by any cession from the State of New York to the General Government, the immediate danger to be guarded against being likely to arise upon the Canadian side. This danger must be prevented by negotiations between the General Government and the Canadian Government;

and this gives rise to the question what power the two Governments in conjunction may have over the entire question. Niagara River is an international boundary, and in point of law a navigable stream its entire length; and the Federal Government already has the right of jurisdiction over it, and has exercised such right. With the lakes it is an international highway, so made by the Ordinance of 1787, establishing the Northwest Territory, and by treaty with Great Britain; and as such the National Government is bound to protect it. This was made very clear by Judge A. K. Potter, one of the Commissioners of the State Reservation at Niagara, in his able argument before the International Waterways Commission on the 14th of last September. The upper river is practically navigable from Port Day, at the upper end of the State Reservation, to Lake Erie. The water cannot be lowered on one side without lowering it on the other; and Judge Potter argued that the people of both countries could require their National Governments to maintain its level. If the Federal Government requires its consent, as it has required it in the past for the building of a boom, or winged dam, in the Niagara River, to protect the intakes of the power companies from ice, it certainly would seem as if its consent could be made a condition precedent to the diversion of the water itself, and that by a treaty between the two Governments all further diversions of water could be prevented.

The possession of the State Reservation by the General Government would simply authorize it to refuse diversion along this water front, as the State of New York may now refuse. Such ownership would not add in the slightest to the power of the General Government to prevent the diversion of the water from an international highway. These suggestions seem to make it plain that any cession from the State of New York to the Federal Government would not add in the slightest to the protection of the Falls, since it would confer no power on the General Government which it does not already possess.

I have thus far assumed that the State

of New York would not permit any diversion of the water below Port Day or within the limits of the State Reser-It must, however, be confessed that such permission is legally possible, since it may be given by the Legislature. For twenty years the Commissioners of the Reservation have wielded all their power against every attempt to invade the limits of their jurisdiction, and thus far have been completely successful. Not a drop of Niagara is diverted from the river within the Reservation for commercial purposes, and it is to the credit of the entire State that twenty years ago it drew a cordon around the Falls within its jurisdiction and that portion of the river reaching to Port Day, and that cordon has been a dead line which no individual or corporation with designs upon the majesty of the cataract has been allowed to pass. It does not seem morally possible that this policy could be changed, but it would be a wise safeguard were a constitutional amendment adopted prohibiting further diversion of water, and such an amendment I deem it the clear duty of the Legislature to submit to the people of the State at the earliest practicable moment. Such an amendment was recommended by a committee in the Constitutional Convention of 1894, but the Convention refused to The present situation was adopt it. clearly foreseen by the late Andrew H. Green, for many years President of the Commissioners, who in every possible way gave his great influence to the protection of the Falls, not only in the work of the Commission but in the Constitutional Convention. The situation, however, was not as well understood then as now, as may be seen from the fact that the Legislature of 1904 adopted a joint resolution memorializing the President of the United States to negotiate a treaty with Great Britain to prevent further diversion of water. There can be but little doubt that if the Legislature would submit to the people the suggested amendment it would be ratified by the popular vote.

As an evidence of good faith in dealing with the authorities controlling the river upon the Canadian side, and also for the purpose of bringing to bear a moral pressure of great weight, it is desirable not only that such an amendment to the State Constitution be proposed and adopted, but also that the Congress of the United States should pass an act forbidding further diversion of water from the river within American boundaries above the Falls.

The situation, then, as it appears to the writer, may be recapitulated as follows:

- 1. The authorized diversion of the waters of the Niagara River, when exercised to its full extent, will seriously but not wholly impair the Falls.
- 2. That further suggested diversion should be prevented, if possible.
- 3. That the transfer of the State Reservation at Niagara Falls from the State of New York to the Federal Government would be valueless as a remedy against the proposed evil.
- 4. That this diversion can be absolutely prevented by the joint action of the Government of the United States and the proper British authorities.
- 5. That it is desirable that the Legislature of the State of New York should revoke all charters for the diversion of water under which operations have not been commenced in good faith.
- 6. That an amendment to the Constitution of the State should be adopted providing for the perpetual protection of the waters of Niagara River.
- 7. That the Congress of the United States should exercise at once all the powers it may possess to prevent such diversion.

MOUNT HOLYOKE COLLEGE A STUDY IN EDUCATIONAL SERVICE

BY JEANNETTE MARKS

T Gloucester in the last decade of the eighteenth century a resolution was passed that two hours out of the eight hours of daily instruction be devoted to girls, "as they are a tender and interesting branch of the community, but have been much neglected in the public schools in this town"—indeed, much neglected up to that time in every town. In the New England tradition education had been looked upon as a necessity; it had seemed to men a fundamental condition for right living. Behind an ineradicably democratic spirit,

never at all general in the South, lay Puritan conviction not only of the worth of an individual soul, but also of the importance of a man's knowledge and thought, for which training was provided in the common school.

Two hundred years after the establishment of Harvard College there was no college for women, who were still reckoned largely according to their economic value in the community, a necessity in Colonial days, but, with greater internal resources, more service at command, and the advent of the factory,

Digitized by Google

ceasing to be such a necessity. The father who considered his daughter's education as important as his son's for the welfare of the family was then unknown; the father who put his son to work and gave his daughter the distinctively literary training would have seemed to our seventeenth and eighteenth century ancestors derelict—as it may be he really would be. The men of a family, according to good English usage, bore the responsibilities of culture; now these responsibilities are often in the keeping of mother and sister and daughter. Before the close of the first quarter of the nineteenth century but few efforts had been made to give women even the rudiments of education—reading and writing, if need be-efforts which may be designated as fairly unsuccessful.

The royal founding of Mount Holyoke. two hundred years from the date of Harvard's establishment, lay in the generous, undaunted heart of a woman. It had, in common with the greater institutions for men, New England traditions of piety, learning, sturdiness, and the best qualities of good New England blood. vious to this there had been Dame Schools, mothers' helpers, so to speak, for very little children; academies which prepared boys for college, sometimes admitting girls for an hour or so, or, as in the instance of South Byfield and other academies, being co-educational; and the public schools, which had made, in general, no adequate provision for this "tender and interesting branch of the community." The movement for the higher education of women began about 1820 with the Rev. Joseph Emerson at Byfield. Later came the Emma Willard School, still a school in excellent standing, and the Catharine Beecher Seminary at Hartford, which was given up with the removal of Miss Beecher to the West. the South there were several early efforts towards the higher education of women; these schools, prosperous till the time of the Civil War, have since then deteriorated. It was for Mary Lyon, the founder of Mount Holyoke Seminary, to solve the problem of a school for young women which should not be the plaything of circumstance. Mary Lyon's ideal was to establish a permanent, endowed institution, which was "designed to be furnished with every advantage that the state of education in this country will allow." This was no idle castle-building on her part, for the robust, rosy-cheeked, curlyhaired, blue-eyed young woman knew the hard facts to be faced with any such scheme in mind. As early as 1814 she had begun her teaching career at seventyfive cents a week and "boarded round;" she taught up and down the Connecticut Valley, was well known, well liked, and in great demand. All her experience but made her realize more fully how far short the opportunities for girls fell of the substantial education which she had in mind. Limited, naturally, by the times, hers was, nevertheless, a collegiate ideal, as the clause in the first circular of the school reveals: "We intend it to be like our colleges, so valuable that the rich will be glad to attend it, and so economical that people in moderate circumstances may be equally accommodated." As in all colleges of that day and of to-day, Holyoke students then, as well as now, received more than that for which they paid. Her object, too, was the highest object of the highest education: to meet public and not private wants—to serve the country. The opening curriculum exceeded in advancement and breadth of subject any courses offered in any schools elsewhere; it included, among other studies, logic, moral philosophy, ancient and modern history, and the natural sciences taught according to the laboratory method. At the time Harvard was, I think, the only other institution teaching science in this fash-But it was the first entrance requirements that caused the most serious flutter. The "young ladies," not unlike other young ladies of to-day, were in despair at such high requirements; to enter Mount Holyoke they were obliged to pass in arithmetic, geography, history, English grammar, and Watts "On the Mind "-especially Watts "On Mind." Nevertheless, the second year four hundred applicants were turned away because there was not room to accommodate them, and from that day to this the demands have been in excess of room at the institution's command.

The Seminary opened its doors in

THE LOWER LAKE

1837; fifty-one years later it became Mount Holyoke Seminary and College, and in 1893 was chartered as a college only. For several years previous to the opening, Mary Lyon had faced the problem of collecting an endowment. met with opposition, indifference, even discourtesy; but she met with friends, One good gentleman, a minister at Cummington, gave up his pastorate, unblessed by his congregation for so doing, and became Mary Lyon's agent in soliciting funds. "Pa" Hawks, as the students named him, held a newperhaps to call it old would be more apt argument in favor of the higher education of women: he thought that, as woman had been the occasion of the fall, she ought to have the highest possible education to undo the ill effects of the fatal apple. Here is another argument against the present opponents of the higher education, invincible this time, for man has never been known to contest the apple. In sums ranging from six cents, in three cases, upwards, they collected \$27,000 for the first building, an amount representing eighteen hundred subscribers. Deacon Safford, a prosperous Boston merchant, was one of the early promoters of the institution. He repeated his first gift, \$500, a generous sum for those days, many times, and he considered his investment, as did many of Mount Holyoke's friends, the best he had ever made; for, he said, there was " no depreciation in the stock; it vields the largest dividends."

The early hall, built, as its founder wished, of the best material, provided with the best plumbing and heating the times could give, nevertheless, in Puritan wise, made but little of the outer aspect. Yet, as in the case of a New England church, it had a character of its own, quaint and not unattractive. To-day the seventeen main buildings form a unified impression uncommon among our American colleges—buildings, largely English Collegiate and Tudor in style, divided into two campuses: the residential and the academic. Some of these buildings seem a part of the earth in which they stand—than this unity there is no severer architectural test. Even the newest comes as gracefully from the turf as if it

were kin to its neighbors the pines. Of the ugliest possibility on the grounds—the power-house smoke-stack---John Ruskin would not have been ashamed. grounds, a third of a square mile in extent, show modified English traditions of learning in buildings, lawns, parks, ordered groves, driveways, little streams and lakes. From "Prospect," which rises two hundred feet at the edge of the lower college lake, may be seen two ranges of hills, green in spring, with the gray of rocks showing through the delicate feather of budding leaves; deep green and dark blue in summer, with wide flumes of shadow between the valley hills; red and gold and brown in autumn; white in winter, with the pines scattered here and there and the soft fringe of leafless trees along the summits; above, the vivid blue of a winter sky. Through the cut of the Connecticut River between these two valley ranges lies a wide upland of blue hills stretching away towards Cummington, Little Switzerland, and the girlhood home of Mary Lyon, two thousand feet above sea-level. It is all not only a scene of meditative beauty, a place of wonderment, the hills trailing into blue distance, but also a scene of indescribable richness, luxuriance, fertility. Connecticut Valley is one of the most fertile valleys in the country, with no hint of the sterile, rock-ribbed pastures of Massachusetts. In its garden aspect it resembles much of the English hill country. As with Wordsworth, love of nature has led to love of man and a keen sense of the immanence of the divine-

" a sense sublime
Of something far more deeply interfused,
Whose dwelling is the light of setting suns,
And the round ocean, and the living air,
And the blue sky, and in the mind of man."

The careers of many of the women who have gone forth from Mount Holyoke have been characterized by reverence for the divine in the world about them, love for their fellow-beings and a desire to serve them, just such a spirit of worship and devotion as mountain solitude since time was has bred among people. From this valley these women have followed duty into the crowded and the evil places of the world,

to remember with refreshment this bountiful life of nature, sun and moon and stars, the cool latticed light of ferny pathways, to hear in retrospect the whispering blades of grass, the bees bustling in the flowers, to love nature's various music and all the windage of the hills; to see again the checkering of light and shade on mountain-side and on lake and stream, and the colors of nature's coverlids,

"Gold tinted like the peach

Or ripe October's faded marigolds," and to feel, as Keats did, sleep filled with the soft sound of water and with moonlight.

To live in so beautiful a world makes

"teacher" was not looking, and received a wholly unexpected blessing. were two things Mary Lyon announced, with a twinkle in her eye, the "young ladies" were not to do while at Mount Holyoke: one was break the fire regulations, the other kill themselves. If they insisted upon killing themselves, she continued, then they would better go home and die in the arms of their dear The early school had much mothers. ill health to combat, for the poor health of the women of the late eighteenth century and the early nineteenth century is something appalling as one looks back from the robust womanhood of the present. One physician of the first quarter

THE GYMNASIUM

for the healthiness of body and soul, it contributes to a fuller, purer womanhood as well as manhood. The alumnæ mothers, thinking of the health-giving out-of-door world as well as of other influences, send their children to Mount Holyoke. One mother's greatest sorrow was that she could not send her sons there as well as all her daughters. Undoubtedly, if those boys had come, they would have been met with the hospitality characteristic of the college. Still, it might have been necessary for them to behave rather well. I have heard one boy, now a distinguished elderly gentleman, tell how, while visiting the Seminary, he made a raid upon the cookies in the kitchen when he thought

of the nineteenth century said that not one woman in ten enjoyed complete It was Mary Lyon's aim to health. correct this; and so well did she succeed in making a beginning that if there is anything the matter with nine-tenths of the present college students they do not know it. They are so busy with walking, basket-ball, hockey, snow-shoeing, and skeeing, that they do not spend time in imagining ills they have not. One has to read the psychological tracts of faddists before one is fully aware of the lugubrious, anæmic straits to which, these tracts say, college girls are reduced.

The antidote to this deplorable condition of educated womanhood which the psychologists advocate, critics to the

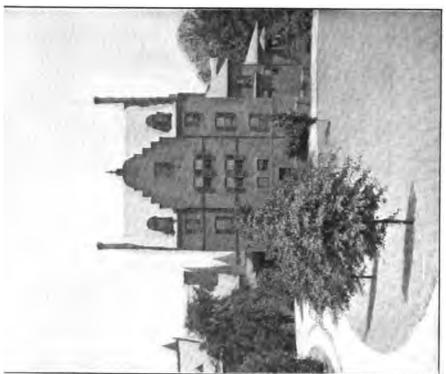

contrary, Holyoke has never possessed. She has never had any teaching or system of domestic science. The founder had most uncommon good sense: she had no notion of relieving mothers and home life of their duties. Mary Lyon wrote: "I have no faith in any of the schemes of manual labor by which it is supposed that girls can support themselves at school. I should expect anything of that kind would become an expense rather than an income." There was in the old days no service to be obtained in South Hadley, and, too, it made the expenses somewhat less for the students to do a little household work. At first seventy minutes for each stuexperience which seems to me now in retrospect even more valuable than a condition. At Holyoke all the heavy work is done by servants; no student is allowed in the kitchen; practically the flourish of duster and pen describes the arc of domestic duties.

"Everything I do is such a privilege!" exclaimed the Founder; and I am certain that the old girls thought the dusting and bedmaking, or "just taking a step from the fourth floor down to the basement," part of an idyllic scheme for their advancement. There was no satiety then to dull the eyes and stuff the minds with a sense of indifference, nor is there now. One old alumna writes that not even the

THE LIBRARY

dent covered all the work that was required; now an average of less than thirty minutes is sufficient. Although the writer thinks even thirty minutes daily for four years might be more advantageously spent in golf, in skeeing, or at a concert, yet the prescribed domestic work has its advantages. It maintains a level of admirable democracy; it is good for the rich girl; it does no harm to the poor girl who is accustomed to more than is required at college. It creates a certain helpful, unselfish, friendly spirit. Personally, I enjoyed myself immensely as a Freshman at Wellesley during the last year of domestic work at that college, when I sold ink and mucilage on a sliding scale, an side step in calisthenics had proved useless to her; doubtless she has come upon the day of the automobile, and we all know the joys of the "side step" nowadays. Eager is the word that characterized the mind of the Founder, and eager is the word that marks the spirit of the present college. Fifty years before its actual inclusion in the curriculum Mary Lyon was seeking a way to provide Hebrew. Seventy years ago, when there were no standards for the education of women, Mary Lyon set a standard which in its broad purpose is not yet realized. The Founder would have resented indignantly any attempt to limit her mind between the covers of a book, that mind which could master the contents of a

Latin grammar in four days. The textbooks used then and at present are merely adjunctive. In texts obstacles are at a minimum; and at Holyoke obstacles are highly prized, such obstacles as force the "young ladies" to the unhappy necessity of doing their own The lecture system, too, is at thinking. a minimum: I have noticed that as long as the lecturer continues to lecture, and the absorbent heads continue to wag, and the fountain pens continue to spurt, students have a sense of comfortable superiority. The thrust direct is the simple question to the individual student; and such a method is thoroughly hygienic, for it prevents, on the part of the students who are trying to answer, the feeling of an overcrowded brain.

Mary Lyon believed that the Christian spirit is a quickener of mental power. If the beauty of word and beauty of thought in the Bible are any evidence, then, indeed, it must be! Her own English, although marked by some of the cant phrases of the time, was singularly pure, graphic, direct, cadenced. And from laughter to tears she had the power of speech. But what the "Christian spirit" did for Mary Lyon was to make her service as a teacher incorruptible— I do not say faultless; and from her the college has derived an ideal in teaching which has nothing to do with "trade." and which sets no value upon the intellectual adventurer however brilliant, however likely to succeed in climbing the ladder of high place. "Never teach immortal minds for money," said the Founder, and certainly she did not; the average instructor in the College to-day receives five times as much as Mary Lyon did as President. Teaching as a service has been the aim of the College; and from the first Holyoke has had an enviable record in making good teachers of her students, students who have taught the world over with the courage, the self-sacrifice of pioneers, in this country, in Persia, Turkey, South Africa, the Transvaal, in Spain, in the Hawaiian Islands, and in Japan, where they were the first to provide for the higher education of Japanese students. Holyoke has, indeed, been the "Mother of Schools," and, to count only the colleges, there are

five which owe their origin directly to her.

The Connecticut Valley might better be called the Valley of Colleges, for up and down its river are Amherst, Williams, Smith, Trinity, and Yale. Such a segregation makes unusual intellectual opportunities possible in interchange of lecturers, instructors, entertainments. the whole country is a laboratory for observation work, from the monster, whose cacophonous name I have forgotten, who accommodatingly planted his extraordinary feet on the Connecticut Valley river bed, to the spring display of living birds which would make an unprincipled milliner wild with greed. It is, too, not only a valley of colleges, but also a manufacturing valley, which offers unusual laboratories for economic and sociological studies.

The members of the Faculty of the Mount Holyoke of to-day represent a high degree of advanced work; they come from the graduate schools of almost all the universities in this country and from many abroad. Merely the new appointments for the year 1904-1905 include degrees from Barnard, Vassar, University of Chicago, University of Michigan, University of Berlin, University of Paris, Massachusetts Institute of Technology, Columbia University, University of Cambridge, England, Wellesley, Bryn Mawr, and Yale University. In 1837 the Faculty was represented by a principal, an associate principal, two teachers, three pupil assistants; in 1896 there were thirty-eight teachers, with seven library and laboratory assistants; in 1905 there were twenty professors of full standing, men and women; nine associates, thirty-five instructors, twelve assistants and readers, and an administrative staff of twenty-four, including the president, registrar, secretaries, and stenographers. Mount Holyoke, together with other colleges, offers a large number of electives; there is a slightly greater demand in required work, the proportion of required studies to electives being somewhat higher than in other colleges of equal standing. There are about thirty-five undergraduate scholarships, and there are four full fellowships for graduate work. Each year senior honors

THE COLLEGE CHOIR

are conferred on two candidates and sophomore honors on four students. In addition to these distinctly academic honors, Mount Holyoke has a Phi Beta Kappa Charter, granted in 1904. Out of six hundred and seventy-four students for the year 1905, twenty students came with advanced standing from other colleges, and in the residence list twenty-five States and three foreign countries were represented.

In the class-room a great deal of individual work is done; the classes and laboratory sections are kept small, so that the work of each student may receive careful attention. Of necessity there are some large lecture divisions, but, on the whole, there is an approach to the tutor system which Princeton is now introducing. From the beginning the students have never been led to think that their acquirement could be or was remarkable; they are taught how to study and shown the wide country before them, and, in their modesty, I think the general tendency is to underestimate what they know. There is

rigid opposition to the modern commercializing of college work, on the one hand, and, on the other, to the all-sufficiency of the extreme intellectualists who think acquirement, per se, the end. Learning as a "trade" is discountenanced, not only by the staff, but also by the administration. Study as a preparation for right living, for life usefulness, the establishment of high ideals, is the aim of the College. Such a purpose could not be maintained were it not for the traditions of Holyoke and the untroubled unity among its present Faculty.

From early days the College has been more than ordinarily well equipped for scientific training, and the students particularly eager, for reasons connected with the special fitness of the staff and their own personnel, for this work. Now the humanities are coming into their own—history, philosophy, literature, art; and this is well in the present day and generation, for three reasons—the character of the times, the personality of the students, and the probable future demands to be made on most of the girls.

Digitized by Google

For myself, I believe the idealizing faculty may prove, in the well-ordered life, under some circumstances, an even greater gift than scientific knowledge. Let students once realize that beauty of expression is in a manner essentially practical, and they will put it to use; their houses, where they make homes, will have in them only attractive and useful objects; they will light a cleansing bonfire with all the vulgar rubbish, cheap decoration, which usually goes by the name of furnishings. A book, a picture, interprets history; it fills the mind with memories that remain to uplift, to purify, to strengthen. If ever there was one, the educated American woman of to-day is an individuality; she is practical, self-reliant, capable which is all very well. On the other hand, she has been accused (and justly, I think) of lacking in sympathy, imagination, refinement. And I would suggest that it may be a direct duty in the course of our education to develop sympathy and imagination; for not only will they lead to deeper personal experience, but also to a greater love for country and a finer sense of the universality of men and nations.

I do not know of any students who, in the long run, are more likely to love "the principle of beauty in all things" than those at Holyoke. Their morale is excellent; they have come to college for work, and they work; they are desirous of the best; they have turned as eagerly to the world of letters and art as to their opportunities in science; they are highminded in their studies, upright, trustworthy, courteous. I have never known an appeal to them as gentlewomen, an appeal to their honor, their sense of right, to fail of generous response. Lacking in judgment they may be, as students old as well as young often are, but I have not found them lacking in honesty. The system at Holyoke has always been an "honor" system. Even in the old days, when "discipline" was a more common feature than it is now, Mary Lyon's severest rebuke ended with a gentle, "Now you won't do it again, dear, will you?" It might be written of the majority of students who have gone in and out of Holyoke's doors, Mens sibi conscia

In the early days there was no recti. espionage; students reported upon themselves, poor dears! and thereby, I fear, lost much wicked pleasure which in other places has come to some of us. Mary Lyon had an especial liking for the "lively girls," for, she asserted, if rightly directed they did the best work. However, she watched these "lively girls "carefully, and was heard to remark that some young ladies who were harmless oxygen and nitrogen by themselves, if brought together made nicotine and strychnine. The early influence was against class feeling; the students were considered as a unit. Since then great class feeling, so harmful all over the college world, has arisen. Now Mount Holyoke is swinging back to the old ideal, and the social center of the life is to be a general college society. unity of the undergraduates is shown in the unusual success of their Christian Association work, in the educational extension work the Settlement Chapter is doing in the valley, and in no other way better, I think, than in the Mount Holyoke choir, numbering one hundred and eighty students. An English lady who was asked what had impressed her most in America replied, "The mammoth trees of California and the vested choir of Mount Holyoke College."

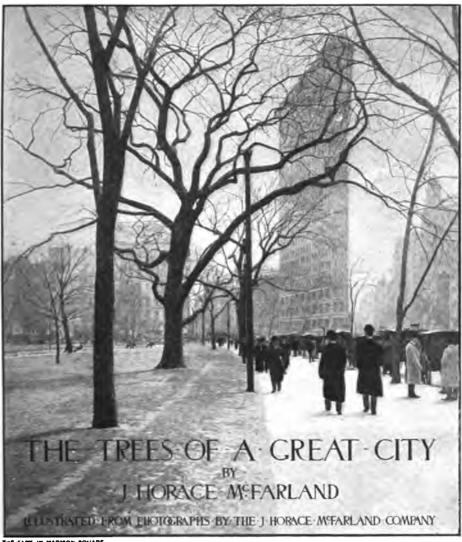

In conclusion, no history is without its mistakes, without features which may well be criticised. If Mount Holvoke was provincial in her early days, it was at least with the best provincialism of idealistic New England, a heritage no more to be despised than the early laws of Athens or the severities of Sparta. she erred, she erred Puritan-wise, in loss of perspective, in failure to distinguish between the minor essentials and the major essentials. Some of the records of the old days show, too, the over-anxiety of the Puritan conscience; it may be that the emphasis nowadays is too much on the value of work regardless of the "still, small voice." Then also it must be said, I think, that the old students were taught to look upon life somewhat as a burden, a cross to be borne. extreme, prevailing in early seminary days, prevailed, too, at Dr. Thomas Arnold's Rugby. Our present life, as something almost wholly joyous and to be made almost wholly beautiful for others as well as for ourselves, is a very modern conception. It is the spiritual evidence of an age in many other respects sordidly commercial.

The best of the old ideals are still intact to-day. The aim of the College is preparation for service, the development of a woman physically, mentally, spiritually. It is upon efficient service rather than upon pleasing accomplishments that the emphasis lies, with the happy result that the faddishness of the higher education for women has scarcely touched Holyoke. Miss Lyon, who said that she thought it exceedingly doubtful whether she should ever see heaven, went on cheerfully preparing the best daughters, sisters, wives, teachers, she could, whose qualities she herself possessed pre-eminently—piety, good health, and a merry heart. In an absolutely nonsectarian spirit she applied the truths of the Bible to every-day life.

Two women have met quietly, nobly, the opposition and indifference attending every considerable movement for betterment—Mary Lyon in human founding the Seminary, Mrs. Elizabeth S. Mead in the shifting from Collegiate Seminary to College in full. President Woolley, coming into the heritage of their work, continuing the traditions of the culture of heart and intellect in which Holyoke was established, is making for the College a high place among modern institutions. In the best sense of the word Mount Holyoke is a public institution dependent upon the public; it was founded by and has been continued in widely distributed public benevolence; it has received several large bequests, but the aggregate of its smaller bequests has been larger. In this day of extraordinary individual endowments we have the spectacle of a college whose strength is not in one purse but in the loyal generosity of a wide public of alumnæ and friends who are aware of their responsibility and who take it up gladly because they feel that Mount Holyoke has unfitted women for just one thing-idle society life.

THE DWIGHT MEMORIAL ART BUILDING

TE ELMS IN MADISON SQUARE

OT long ago, speaking of the destruction in Philadelphia of the great Lippincott Elm, for generations a landmark of the famous "Yellow Mansion" which now gives way to a sky-scraper, the Governor of Pennsylvania said to me, "You know there are no trees permitted to live now in great cities." I had to deny such knowledge on my part, and with gladness, for I knew no great city without its great trees; and the greatest of them all, the greater New York, is notable for its persisting trees along its thronged highways,

as well as for those included within its Bronx boundaries. Even Philadelphia, with its City Hall monstrosity, its splendid people, and its gridiron street system, has left some few fine old trees, and many avenues of lusty young poplars and maples, sycamores and pin-oaks.

The trees of old New York, the old Dutch town, have long fascinated me. Though not a resident of the metropolis, many tendrils of my business life are interwoven with its streets, and I have grown, in passing years of incidental observation, to love it and to believe in it.

Digitized by Google

A SWAMP WHITE-OAK FLOURISHING ON ONE HUNDRED AND FORTY-SECOND STREET

City of contrasts it is, with the blood of all races mingling in its arteries of life; yet with all the contrasts of good and evil, misery and happiness, poverty and wealth, ugliness and beauty, the great tendency, I have been forced to believe, is strongly toward the good, the true, and the beautiful. Every year the sky-line, long ridiculed, becomes more nobly beautiful mass; every year more light sifts in among the habitations of the very poor; every year there is more to justify New York as the great gateway to the promised land of the West.

The trees of old New York greet the incoming potential citizen, if he looks to them, right where the city's prow thrusts into its Atlantic waterway. Battery Park has them, young and old, and none with brighter message against the sky than the thrifty white pine which holds its greenery always. All these Battery Park trees, mostly in lively health, are to become greater as the years go over them, for now there is kindly consideration for their needs.

I fancy that not many who are drawn into the Brooklyn Bridge vortex think of the trees they see or pass under as they hurry across City Hall Square. Yet the elms are there, bravely holding their own in this priceless green

spot amid the central activities of lower Manhattan. Their summer garb is grateful to those who pass, and their characteristic branches against an October sky dwarf the buildings beyond. It is on a snowy night in winter, however, quiet enough to keep their limbs from much swinging, that they are most absorbingly interesting, as the long, transparent shadows cross and intermingle on the white covering of the lawns. Every detail of their interlacing structure is cast down before one on the snow, and the lengthening and foreshortening, as source of light is distant or near, but emphasize the tracery of twig and limb. It would seem as if these trees, winter and summer, were knowingly glorying in their position as they hold an oasis in the desert of rush and rumble about them.

Let us take an express train in the Subway, after leaving the trees of City Hall Square, and make our first stop at Fourteenth Street. Union Square, another oasis in the Manhattan-Sahara of buildings, holds trees that seem to belong there most substantially. They dot the park and shade the benches that hold the hopeless ones-for surely those who sit here in summer have mostly read the inscription said to designate the entrance to

ALL THAT IS LEFT OF THE GROUP OF THIRTEEN COMMEMORA-TIVE SOUR-GUM TREES PLANTED BY ALEXANDER HAMILTON

a place not distinguished for arboreal features, even though deeply paved with desires to do well! It is a matter for continual wonder to me that so many waifs, so many who seem to have been unduly buffeted in life's struggle, find it worth while to sit in Union Square. Occasionally one who there holds down a bench is merely tempted by the greenery to sit and read or rest, but I cannot avoid the feeling, if I may judge by their looks, that those mostly rest here who have no places they may call their own in the world. Is it because of these same trees that give Union Square a little of God's forest home-feeling that there is this making of the place a sort of refuge for the homeless?

One of the peculiarities of New York trees is the number of survivals along her streets right at the house line instead of at the curb line. See this sturdy catalpa, for instance, holding its full, heart-shaped leaves over the Fourteenth Street sidewalk, not far from Sixth Avenue. It is well inside the sidewalk's edge, and, with the lusty ailanthus on its left, seems as if it had escaped through the fence which guards one of the remaining precious bits of open space yet remaining in this thronged A little looking will show the observer many such trees, often immediately next the house which protects them, and existing, undoubtedly, by the kindly sufferance of the property-owner. I have acquired a habit, as I flash up and down the elevated roads that cut Manhattan longitudinally, of looking for these fine old survivals on the cross streets, and if I were merely to catalogue them, the number of locations would surprise those who have forgotten that a metropolis may hold and love the few trees that remain to her.

On Twenty-fifth Street, west of Sixth Avenue, I saw a rather comical catalpa survival the other day. Right against a new sky-scraper, not yet occupied, it stands, and in front of the tree there is one of those interesting remainders that distinguish New York. A two-story frame house, probably seventy years old or more, is next neighbor to the new ten-story temple of industry, and this catalpa, evidently planted long years ago

in the back yard of the little house, has grown up and up, seeking for light and air, until it holds an umbrella right over the humble and somewhat ramshackle structure that originally protected it, seeming at the same time to shake its yet vigorous head at its new neighbor on the east with a promise to go right on up and top it as well! A little inquiry proved that the owner of the old house had refused to even name a price to his big neighbor, preferring to live his life out where his home had long been, under his own literal "roof-tree."

The catalpa, by the way, was seemingly a favorite with the New York tree-planters of past generations. These winter days one shakes in the wind its "Indian pipes" of bean-like seed-pods among the elms of Union Square, though I doubt whether many of Manhattan's school-boys ever try to make cigars of the tight little cylinders according to the accepted and familiar fashion of their country cousins.

Follow the line of travel north from Union Square a few blocks, and if the searcher is at all tree-wise he will see the elms of Madison Square as soon as he will the "garden" over which Diana poises, or the "Flatiron" building that holds back the rush of lower Broadway from invading this fourth oasis. The trees of Madison Square are peculiarly fascinating in their leafless condition, when they draw lines of intricate grace across the vast hives for human bees that shut in the little park on four sides. At just the right place along one of the eastern walks the elm branches help the daring architectural attempt of the new Church of the Transfiguration to protest against its towering neighbors.

But it is athwart the Flatiron building in the late afternoons of the leafless months that the Madison Square elms are most impressive. The strong sky of the southwest throws the front of the great building into soft shadows, deeper on the Broadway side. From this same Broadway side of the square—which is in no sense square—the elms, held back by city and climatic conditions from the stately stature of their kind in New England, throw wonderful black lines across the building and the sky, marking the

real dignity of the much-abused structure. There are a dozen other vantagepoints under and near these trees from which the distant view of the great building is made more beautiful, while the value of the tree in its countering of the architect's ideals is enforced upon the thoughtful observer.

To bring to mind what an influence

Too bad it is that Madison Square should furnish one of the few places in all Manhattan where wires have been allowed to cause tree mutilation! If the Manhattanese who reads will, on opportunity, look from the south center of the square toward West Twenty-third Street, he will be outraged to see that for but two electric light wires a great elm has

AN OLD CATALPA ON FOURTEENTH STREET NEAR SIXTH AVENUE

these oases have on the rapidly improving and maturing architecture of the great metropolis, stand in Madison Square about the center, and, facing successively each compass direction, imagine the trees all gone, and the open place purely open, without the grace of branch or the shade of leaf, with the Flatiron shouting against the Garden building, and the opposite corners as noisily striking the eye in hard contrast!

been sadly mutilated. A few dollars have been saved in underground conduit cost, to the lasting shame of the park authorities, who have permitted a wrong they cannot repair.

A strong contrast to the elm lines that grace most of the tree survivals of Manhattan is presented in the sturdy sycamore which holds place on the sidewalk at the northwest corner of Gramercy Park. Other good trees there are also

THE ELMS IN STUYVESANT SQUARE

The children love to sit and play under the trees in early spring

in this rest spot off the hurried line of heaviest traffic, but none more picturesque than this upright-limbed "button-ball," that gives all who observe an occasion to see the remarkably diverse ways in which nature garbs the woody stems of the trees. The close-knit bark of the pervading elm is a sort of dress-suit, in contrast to the loose plates of the sycamore's skin, dropping off so easily at the right time, and showing well the underlying light-colored new suit of working clothes.

I think it is an English elm that towers over and graces the picturesque "Little Church Around the Corner" in Twenty-ninth Street. It aids, too, in giving to this notable and hospitable church the feeling of broad inclusiveness which every one who passes through the curious covered gateway must, it seems to me, at once receive. Just this little spot of green grass, with its few but most important trees, succeeds in setting out this church visually to a wanderer, who knows nothing of its history and habits,

as a true "city of refuge." When I first chanced on it, turning in weariness out of Fifth Avenue's afternoon parade of the uncomfortably rich, I did not know what the church was. I was drawn by it, however, to pass the gates and wander in sudden peace for a few moments, the stress of the day gone; and for me the whole setting of the church was made lovely and restful by these fine trees, worth infinitely more to my spirit than the stateliest of the great structures that lift spires to heaven.

It may be remarked that I speak of and show principally bare trees, without the foliage that makes them so grateful in the summer sunshine. I admit that, while the green leaves are pleasant and restful and cooling, it is the twig and branch structure of the city tree that interests me to the point of fascination. What I have written as to the grace added to great architecture by proximate leafless trees is only one of the good reasons for this fondness. Another is indefinable, but others feel it unconsciously,

else why is every seat taken in Stuyvesant Square on a spring day, long before there is the least thought of greenery from the trees above or the grass beneath? The boys must keep hands in pockets against the chill air; yet here they are, and the girls, too—not in the street, where the sun shines as warmly as in the little park, but under the bare trees. Somehow, in some way, the elm branches call to the children, and they come!

I must tell of what these trees of Stuyvesant Square, and the open spot they stand in, did for two friends who came from a forest-girdled university town into the noise of Gotham. Both of them ardent nature-lovers, and both having used their love to aid in getting

knowledge of trees, when it came into their lives that their family altar must be transferred to New York if the man of the pair was to grasp the vanishing heel of opportunity, there was deep dread. Only thoughts of the Brooklyn Bridge and of the roar of Broadway came to them, and it was in all seriousness that they took my solemn assurance that trees were actually known to exist in Manhattan, and that grass grew and wild flowers bloomed within less than an hour's ride of City Hall Square! When I could also convince them by insistence that all New Yorkers were not bunco-steerers, that warm red blood did beat in many hearts carried along by corporeal bodies bearing hands to be honestly shaken in friend-

A LUSTY WHITE PINE IN BATTERY PARK

ship, and that they would find the city life less complicated than they anticipated, they came. A kind providencenothing less !--manifested through a scanty exchequer, directed them to an apartment all too high as to steps sans elevatorial alleviation, but facing on Stuyvesant Square. Here they found a tree-scape to soothe their eyes and cleaner breath for their lungs, and they took to the life with joyful success. In the course of time the pair heard the voice of their baby daughter first in sight of these trees, and although they have now joined the noble army of Jersey commuters, these elms of Stuyvesant Square were the salvation of them in their induction into city life.

The conditions of the great city are not, I must admit, especially favorable to tree life. Those individuals that survive show both hardiness and adaptability. and they ought to be-and for the most part are—esteemed most highly in consequence. The ailanthus, of which only the blooming form is unpleasantly odorous for a short season, does endure the hardness of city life, and supplies a great arborescent canopy where it can find foothold. On Forty-third Street near Tenth Avenue the monotonous house line is broken beautifully by a close-set row of these trees just inside the fence that skirts the sidewalk. Such trees make one most reverent to the memory of Mayor Grant, whose ax at the bases of the electric poles of his day has left these streets of the city free for trees. If poles were permitted, these "trees of heaven," as the ailanthus is somewhat pretentiously called, would inevitably be shorn of their glory.

A jump of almost a hundred blocks in this mere hint of the trees that may be found in New York brings us, in One Hundred and Forty-second Street near Amsterdam Avenue, to what is perhaps the most remarkable tree of all in the city. Usually we expect to find the swamp white-oak in a moist locality, under forest conditions. It is not ordinarily planted as a shade tree on city streets, wherefore it is with both delight and surprise that this really striking specimen is discovered. Other trees are in sight, but the swamp white-oak is

easily the monarch of them all, standing as it does in the conventional position just inside the curb, and reaching well upward along the lofty apartment-house which it fronts. Upper New York is fortunate in this tree. If it just happened, as a survival of the forest, to stand where a sidewalk curb was to come, its situation was most fortuitous; and if it has been lovingly planted by some one who had the forest thought in his heart, I wish him always green leaves to shade him, even on the golden streets!

Not very far from the swamp whiteoak, at One Hundred and Forty-fifth Street, there exists—barely exists—a melancholy group of trees to remind us of man's forgetfulness and carelessness. Though close to a church which might well have cared for them, these poor old sour-gum trees are dying of abuse and neglect, the signboards attached pointing one ignoble use to which they are subjected. Yet these are the survivors of a group of thirteen sour-gums planted by Alexander Hamilton in commemoration of the thirteen colonies that joined to throw off the yoke of England! Doubtless the great statesman selected the gum because it is both longlived and tough; but he could not provide against the neglect of posterity. Tradition has it, without adequate foundation, however, that when the war of 1861 broke out, the trees intended to represent the seceding States were cut down. Better that all should have been cut down than that these survivors should be left to show neglect and to bear the ignominy of advertising signs!

In Central Park, as in the Bronx Park. there are many and magnificent trees, and of many kinds. Of these I do not speak at all, for they are not characteristic of the street conditions to which I want to draw attention. The hundreds of trees throughout Manhattan's busy thoroughfares may well be made the point of walks and of interesting investigation by those who have opportunities denied to me, who must take my New York in very small portions. If this interest is aroused, these surviving trees will become objects of even greater care and attention, and their useful lives will be greatly prolonged.

Trees amid the rush at the Bridge entrance

THREE RECIPIENTS OF THE NOBEL PEACE PRIZE
Frederick Passy, President of the French Peace Society: Baroness von Suttner, President
of the Austrian Peace Society; and Eli Ducommon, President of the Peace Bureau at
Berne. The photograph was taken at the Lucerne Peace Congress of 1905.

THE BARONESS VON SUTTNER

BY HAYNE DAVIS

Parliament is compelled every year to scan the world's sky of peace workers for that particular star which has shed the brightest light upon the night of our war era, in order to award justly the peace prize of \$40,000 provided by the will of Alfred Nobel, the Swede.

The first year it went to that venerable and wonderful representative of France, Frederick Passy, who, with William Randal Cremer, of England, organized the Interparliamentary Union. Last year it went to Mr. Cremer. This year, when the Norwegians saw the light of Baroness Suttner's incessant activity for the world's peace, they ceased from their labors and awarded it to her. It was she who inspired Alfred Nobel to make this remarkable bequest, and Frederick Passy has called her the General-in-Chief of the World's Peace Army.

No award of this prize has given more delight to those who know what Baron-

ess Suttner has done and endured. Inspiring Mr. Nobel to make this bequest was in itself a great service to the cause, and yet it was small when compared to what she has done by her own actions. For nearly twenty years she has never ceased to cry out in passionate appeals for peace, and in a world where women are not accorded that welcome on the stage of public effort which greets them in America. Her voice has gone into the depths of many hearts in many lands, and the response which it awoke has greatly increased the world-wide and world-old desire for peace. "Lay Down Your Arms" is the English title of her most widely read work. It has been translated into all the principal languages and has touched a vast audience. When I saw her at Vienna, in October, she was just starting into Germany, in continuation of her habit, on an extended tour to speak for peace.

She told me that many people had

declared to her that America was abandoned to pursuit of material wealth and power, and, as many published things made our sky look dark when viewed from Europe, she could not know what to believe of us, but that two weeks after

America supporting her of which she was before unconscious, and which she now knows will insure the final victory for peace.

It was at the fourteenth International Peace Congress at Lucerne that I first

BARONESS BERTHA VON SUTTNER

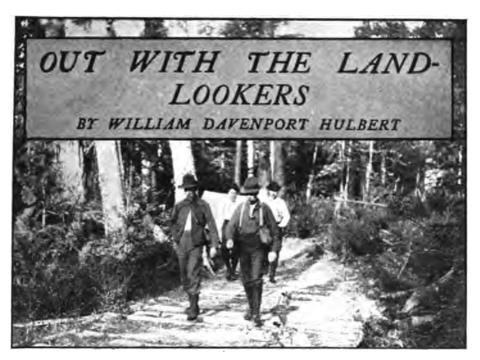

she set foot on American soil and felt the spirit of our people she knew that in America is the hope of mankind. She expressed great gladness for her power to judge justly of this matter, and said that now she could carry on her campaign conscious of a great army in had the pleasure of meeting her. The session was over; the clouds hung heavily over the Alps. I found Baroness Suttner somewhat depressed with the partings and with the inevitable suggestions which come after every forward move, and which attempt to rob us of

our well-earned victory. She had heard, but only in a vague way, of the Brussels session of the Interparliamentary Union, for European papers are not American papers. When it was clearly developed to her how a delegation from the United States Congress, headed by the Hon. Richard Bartholdt, had proposed to delegations from eighteen other national Parliaments the creation of an International Congress, so as to provide a system of law for the conduct of international intercourse, how Count Albert Apponyi had declared in the Conference that this grand idea would knock at the world's official doors till it was admitted, how it had been accepted in principle by the Conference, and a commission, composed of seven eminent members of Parliament, appointed to work out the details for its practical realization, and how one hundred and twenty-five audiences, aggregating one hundred thousand people, on motion of Captain Hobson, had enthusiastically indorsed this idea between January and August, 1905, and how the great Mohonk Conference had cabled its approval and an expression of gratitude to Mr. Bartholdt, she looked long and silently at the colorless clouds hovering over Lake Lucerne. Mr. Felix Moscheles, of London, the eminent artist, was in the company, and he broke the silence by asking, "What are you seeing?" The Baroness replied, "The clouds which this light from America makes radiant."

For many years she had held stead-fastly to the premonition that somehow and in some way peace must come. The night was never dark enough to extinguish her hope, nor the discouragements heavy enough to stop her labors. Now the way was made plain, and powerful allies were revealed across the ocean, in the land to which she had begun to look for light and strength. She told me afterwards, at Vienna, that this had begun a new era for her, the light now shining on the path ahead, and with the goal in sight.

She has been long among those who are not responsive to her thoughts and purposes. At the very outset she had to go against the current of opinion. Austria is one of those States which are

still vainly endeavoring to limit nobility and power to the privileged few. When the heir to the throne was seized, five years ago, with love for a remarkable Countess, whose family has been illustrious for centuries, it created consternation at Court. For a Countess is not royal, only noble. It was finally agreed, however, that he might marry her, provided he would renounce forever all claim to the throne for his children: and he solemnly made this renunciation in the presence of a great company of important persons—for instance, the Emperor, the Ministers of State, the high dignitaries of the Roman Church, who sanction the idea of the divine right of kings. The account of this scene in the papers sounded like an echo from some far-away sepulcher instead of a twentieth-century fact. Well, Baroness Suttner had to go through a similar ordeal. Simple Americans are apt to suppose that a baron is somebody. he is when a count is not present. Now all the Austrian counts seemed to the Countess Bertha von Kinsky of small worth compared to Baron von Suttner. And consequently she broke all court considerations, abandoned her place and position and people, and ran away even from her nation to marry the man who seemed to her a man indeed. dured many hardships in consequence, besides the loss of comfort and position. The timely acceptance of articles by a magazine helped to make a dinner of herbs, where love was, better than a banquet in gilded halls without it. But times change even in Austria. life of noble effort finds Baroness Suttner again in her place at the Austrian Court. A prince can be Vice-President of a Peace Society of which she is President. Austrian members of the Hague Court, Ministers of State, Admirals of the navy, Chancellors of the universities, Ambassadors from other lands, now feel honored to attend her when her doors are opened. Who in America can fail to rejoice in the triumph of Baroness Suttner, because she is a woman, because she has worked so wisely and well in a cause which Americans are now determined to push to final victory, and at no distant day?

"ERE'S Dan's bean-pot. Wonder if we ought to take it. He kicks on any other way of cooking beans. Guess we'd better put it in."

"Here's some boot-grease. Guess we won't take that. Use tallow."

"Here are three lunch-bags. You've got one, haven't you?"

"Yes."

"I've got three compasses. Here's another. Do we want it?"

"No. I can take two or three, and those fellows will have some."

"Here's two late magazines."

" Put them in."

"The canteens will be a good rig."

"Are you going to wear a sweater—or a mackinaw?"

"No—not this time of year. Coat and vest and a cotton shirt."

"Here's something we'll want—fly dope."

We would indeed, for, alas! it was June—fly time—probably the one month of the year that the land-looker most dreads. The timber dealers would have preferred to put off the trip till later in the summer, but the option ran out in

three weeks, and there was no time to be lost.

"How many axes will we want?"

"I think we'll want all the axes we can scare up."

"Well, here's a half-ax, and a quarter, and a hatchet, and here's the big one. Let's touch them up a little, hey?"

" All right."

The grindstone was brought out from a dark corner and they took turns at the handle, each man holding his own ax while the other kept the stone a-whirling. The timber dealers were getting ready to go into the woods to look fifteen or twenty thousand acres of land, and as a first step they were overhauling their outfit and deciding what they should take and what they should not. The long, deep shelves built against the basement wall were piled high with everything one could use in camping, from erbswurst and evaporated potatoes to folding stoves, wool-lined moccasins, canvas pack-sacks, and red bandannas.

"Let's count up the blankets," said one, when the axes were finished.

The blankets were taken down from one end of the shelves and counted.

215

THE LAND-LOOKER WRITING UP HIS NOTES

"Fourteen pair. We ought to have fifteen. I'll get another this afternoon."

"Here's the seven by nine"—pulling out a handsome little wall tent made of waterproofed balloon silk. "We may not need it, but we'll take it along."

"And here's the nine and a quarter by fourteen"—producing a larger one made of heavier material, also waterproofed. "We'll use it for a sleepingtent. And here's the nine by twelve. We'll use that for a cook-tent, but it'll have to have a fly. It's one of those cheap canvas tents, and it leaks."

"Here's the housewife," and the younger man picked up a self-sealing tin can and rattled it to see how full it was. From the sounds it gave forth one would have said that it might perhaps contain needles, nails, spools of thread, buttons, and possibly a few small tools.

"Seems to be pretty full," he said. "Guess there's everything there that we'll need," and he tossed it over on to the pile of blankets.

"Got a whetstone?"

"Yes."

"Here's fifteen plates."

"Ten cups, and four dish-ups."

"Two fry-pans."

" Four bread-pans."

"Here's a nutmeg grater. Shall we take it along?"

"Yes."

"How are we going to pack that stove?"

"Might roll it up in the canvas tent."

"That's a good stunt."

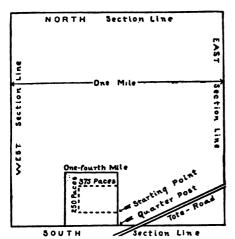

And so it went on. The provisions had already been shipped by freight, direct from the grocer's, and we found them waiting for us the next morning, when we alighted from a railway train at a small station in the northern Michigan woods: The packs containing the blankets, tents, and equipment were unloaded from the baggage-car, and within an hour we had hired a team, piled our stuff into the wagon, and struck out northward across the corduroy.

Besides myself (a non-combatant) there were eight men in the party—the two timber dealers, one of whom was to act as a land-looker, while the other had a general oversight of the work, two other land-lookers, three line-runners, and Daniel Webster, the French cook. The timber dealers were both young men, one of them in his early thirties and the other half a dozen years his junior. Both were men of some education and knowledge of the world, but both, also, knew the life of the woods by practical experience of all its phases. Marsh, meadow, hill — hardwood, cedar swamp, and pine grove-in summer and in winter-by snowshoe and canoe—from the lumber camp, the hunter's shack, and the land-looker's tent—they had seen it all and knew it all by heart. The other two landlookers were cruisers by profession, following a calling which, while it may not require much book-learning, exacts good judgment, a clear head, and a power of keen observation. They were older men than the timber dealers, one of them probably in his fifties and the other in his for-Of the three line-runners. two were woodsmen—father and son—and the third was a college boy out on his vacation. All three were skilled in the art of running by compass and measuring distances by pacing. As to Daniel Webster, he was somewhat of a mystery. How a Frenchman ever came to be possessed of blue eyes, a light brown mustache, and such a name is quite inexplicable; but that Dan was French, or had French blood, any one who had ever heard him talk or eaten one of his meals would have to admit. His accent was pronounced,

THE CAMP

and his cooking would have "The tents stood in the road with tall trees towering above them" been creditable to an experienced *chef*. been in the habit of taking a French The timber dealers had not always cook with them when they went into the

THE LAND-LOOKER'S FIELD OF ACTION
The large square represents a section and the small one
a forty. The dotted line shows the line-runner's course

woods to look lands. Neither had they always gone with several hundred pounds of provisions, a team of horses to haul their stuff, and half a dozen men as their Many and many a time they had started into the woods with no company but each other; and each of them knew what it was to camp out with only a dog for a companion, or with no companion at all, and with only such outfit as he could carry on his back. their father, when he went land-looking in those same woods thirty years before, had often bivouacked in the snow, in the coldest weather of a Lake Superior winter, without even a tent between him and the stars, but with only a little square of cotton cloth stretched on sticks at the head of his bed to break the wind.

But on this trip the circumstances were rather unusual. The tract of land which they were to look over, though by no means the largest that they had handled, was larger than the average, and quite large enough to justify them in taking a crew. Moreover, the railway ran within fifteen or twenty miles of it, and there were wagon roads the rest of the way. So there seemed to be no good reason why we should not have things comfortable.

The laurel was in bloom along the corduroy as we crossed a mile-wide swamp, and here and there, where a little brook meandered through the meadow or among the tamaracks, there was a

bright belt of gay marsh-marigolds. Then, after a time, we left the lowland behind and climbed up into the beech and maple woods, still following the old stage road that leads to the south shore of Lake Superior. Once in a while we saw a pine-tree, but not very often. The lumbermen had been busy in these woods for many years, and there was little pine left. It was hardwood and hemlock that we were looking for. Eight or ten miles from the railway we turned sharply to the left and followed an old tote-road till it dropped down into the cedar swamp again, and there, on a little sandy ridge that rose two or three feet above the level of the low, wet ground around it, we stopped the team and unloaded the wagon of its boxes and packs and bundles. We were a little off the edge of our tract, but the ridge was dry and made a pleasant and convenient campingground, and, most important of all, there was a spring of good water only a few rods distant.

The wagon was backed out of the way, and all hands set to work. Some unfolded the tents and spread them out on the ground, some cut poles and pegs, one man unpacked the stove and drew out the telescoping stovepipe, and Daniel Webster opened the boxes of groceries. It was already noon, and time for lunch-But now Dan made an unpleasant discovery. By some mistake the box containing the bread had been left behind. Dan had other resources, however. The cook-tent was pitched as quickly as possible, and the little sheet-iron box stove set up, with its oven on top and its slender pipe reaching up through a hole in a sheet of tin sewed into the canvas roof, and Dan got out a package of cornmeal and mixed up some johnny-cake. While we were waiting for it to bake, some one unearthed from one of the boxes a long piece of toweling and a cake of soap, and we all went down to the spring for a wash. And presently luncheon was announced-hot cornbread and butter, canned meat, and cheese. Later the other tent was set up. the sape was cut and laid for the beds, and two land-lookers and two line-runners paid a visit to a deserted lumber camp half a mile or more away and came back

with some boards. with which they made a table along one side of the cooktent. Then a bench was manufactured -just a five-inch log laid in the crotches of three heavy forked stakes driven deep into the ground in front of the table. And finally great square of cheesecloth was sewed over the front of the sleeping-tent to keep out the mosquitoes, and was

temporarily looped up with a piece of blue tape taken from the wrappings of a slab of bacon.

"Looks like a wedding dress," said Daniel Webster.

The camp was complete. The two big tents stood squarely in the road, filling it from side to side, and on either

DANIEL WEBSTER AND HIS COOK-STOVE

hand the tall trees kept guard above them.

Meanwhile one of the timber dealers had been preparing plats, one for each land-looker, showing the sections and fractions of sections that he was to look, and now he passed them around.

"Well," said the senior land-looker, when he had carefully examined his, "I think I'll take a little walk and see if I can find the

quarter-post, and be ready to go to work in the morning."

So off he went in his broad-brimmed felt hat, his striped cotton shirt, with the rolling collar and four-in-hand tie, his old vest unbuttoned and hanging loose from his shoulders, and his stout, heavy trousers folded into the high, laced foot-

SETTING UP THE COOK-TENT

gear known in the woods as "cruisers." He was a fine figure of a woodsman. A hundred rods back the road had crossed a section line, and here he stopped to examine the blaze. It was not the original blaze made by the Government surveyors fifty years before. Some one had "renewed" it, and on the broad, flat surface hewed on the side of the tree had written, "140 Paces West to S 1/4 Post."

"It wasn't much of a woodsman that did that," remarked one of the line-runners, who had come along to see what was doing.

"Why not?" I asked.

"He ought to have made the onefourth come before the S," replied the line-runner. "He's got it 'section-quarter,' instead of 'quarter-section.'"

But it told its story, whether it was in strictly proper form or not, and the land-looker had already taken his compass from his pocket and started off through the woods toward the west, walking with a regular, machine-like gait, and methodically counting his paces. The line-runner and I followed, and now and then, as we went, we caught sight of blazes on the trees, some very old and almost hidden by the later growth of wood and bark, and some comparatively new and fresh.

"A hundred and forty steps," said the land-looker, and he stopped and looked about him. Close by stood an old beech, leaning far over to one side, and only kept from falling by the sturdy embrace of a good-sized maple. On the under side of its trunk was a slight mark, all that was left of what had once, half a century before, been a long, broad blaze, with letters and figures cut into the wood.

"Here we are."

It was not the quarter-post itself—the cedar stake which the Government surveyors had set in the ground to mark the middle of one side of a section—for that had rotted away long before; but it was one of the two "witness-trees," one on each side of the line, which they had chosen to bear witness to the post's position, and on which they had left their mark. It was enough. We went back to camp, and after supper—bacon and

eggs, boiled potatoes, graham gems. cheese, pickles, a bottle of strawberry jam, and tea—we sat around a big fire and the land-looker discoursed of the difficulties he had sometimes experienced in "getting located"—finding a corner or quarter-post from which to work. Once it had taken him two days, and when he finally got hold of a corner four miles away and worked back from it, he found that the quarter-post he wanted had stood within a few feet of the spot he had started from. But not a sign of either the post or its witness-trees was left. A forest fire had passed that way, and everything had been swept clean. On another occasion, after a long and fruitless search, he had worked back from a distant corner and found the stumps of the needed witness-trees under a big pile of brush. But to-day's problem was dead easy. In fact, the whole piece of work that lay before us promised to be an unusually pleasant one of its kind—that is, as far as the work itself was concerned. Being mostly hardwood country, the tract would probably afford good walking-dry, firm, and free from excessive undergrowth—which makes a wonderful difference in the ease and comfort with which the land-looker does his work. Also, being hardwood, its growth was more open than that of most evergreens, and one could therefore see much farther through it. One thing, however, it lacked—there was not much water; and a man gets pretty thirsty in the course of a long day's work in the woods.

"It's the driest country you ever saw," the timber dealer said. "That's why we brought the canteens. We've got some oranges, too. There's nothing like an orange to help a dry lunch down."

And something else it had, just now, in too great abundance. We had all been gesticulating occasionally, with more or less impatience, as we sat there by the fire, and presently the junior timber dealer struck himself a resounding dap on the side of his face.

"Shouldn't think you'd let a little thing like a mosquito bother you," said his senior, with pleasant sarcasm.

"I don't," said the junior, calmly. "I'm bothering the mosquito."

A BUNCH OF PULP-WOOD

CUTTING FIRE-WOOD

Just then the senior line-runner spoke up, apostrophizing some being invisible to the rest of us. "Go 'way, now," he said. "You'll get hurt. Go 'way out of here. You won't, hey? Well, then, stay!" and he made a quick grab at something in the air.

"Look, now," he said, as he opened his hand. "He's small. He ain't got his growth yet."

"They're just beginning," said the senior land-looker. "They're late this year. But wait till we get one or two good hot days. Then we'll catch it."

And I may say right here that a few days later we did catch it, with a vengeance, and that the fly dope was copiously used.

The talk turned to wild animals, and one of the timber dealers told how he had one night lain awake and listened to several creatures prowling noisily around his tent. They had stayed for some time, picking up scraps of food,

he judged, and occasionally brushing against the tent-ropes and even against the canvas, but he had no reason to suppose that they were anything more than porkies, and he did not get up. The next morning he found the snow about the tent all trodden down with—bear tracks!

"You were just as safe in that tent as you would have been in a house," said the senior land-looker; and the timber dealer agreed with him.

Some one asked the land-looker if he had ever seen a wolf, and he said he had not, though he had often heard them, and he knew that there were plenty of them in these very woods. Most of the other woodsmen in the party had had the same experience. They had heard them howling, many a time, and the timber dealer had once been followed for several hours by a lone wolf who lifted up his voice at frequent intervals, but who was very careful not to show himself. Nobody present had ever really seen one, and apparently nobody really expected to. They were all agreed that a wolf was about the hardest animal in the woods to lay eyes upon; and, by the way, there were no firearms of any kind in our entire outfit. One does not carry a gun for the sake of sport when looking a dozen forties of land a day. It is too heavy, and it is as much as one wants to do to tote one's self. And as for danger, there are other things in the woods that are much more to be feared than wild animals—dead branches falling from the tree-tops on windy days, holes between roots, into which you may step and sprain your ankle or break your leg, a stray bullet from a hunter's rifle, or the stroke of a glancing ax. The timber dealer told how he had once stubbed his toe upon a steel bear-trap hidden under a light fall of snow; and how, when camping beside the Tahquamenon River, two or three years before, he had cut an ugly gash in his leg, and had wakened in the night to find that the wound had opened and was bleeding so rapidly that the blood had already soaked clear through his blankets. If he had slept a little longer, he might not have wakened at all. No, there was not much danger from wild animals.

The conversation drifted from one

subject to another, while the darkness deepened, the stars came out in the quiet sky, and the mosquitoes gradually disappeared, driven to cover by the chill of the night air.

The college boy was composing a poem in several stanzas in honor of a pretty girl he had seen at the railway station, and presently he sang it to us, to the air of "Maryland, my Maryland."

"Emmeline, O Emmeline!
She uses glyco-thymoline,
And kerosene, and gasoline,
And that's what makes her teeth so clean."

"It's a healthy life," the timber dealer was saying to the senior land-looker. "I know a good many timber-cruisers that are getting pretty well along in years, and they're all strong, healthy, young-looking men."

"That's so," agreed the land-looker.

"There's old man M——. He must be past seventy now, but I met him the other day out in the woods taking a twenty-mile walk, and he was stepping off as brisk as if he was his own grandson."

The fire died down, the air grew colder, and one after another we slipped away in the big sleeping-tent while it was still early evening. At five the next morning Daniel Webster's alarm clock went off, at six we sat down to breakfast, and half an hour later we were ready to start out for the day's work. The senior land-looker and his line-runner went to the quarter-post that they had located the day before, and from there the line-runner took the lead and the land-looker followed. They had the solid section to look—a forty at a time. Now a forty, which contains forty acres and is otherwise known as a quarter-quarter-section, is a quarter of a mile square. There are sixteen of them in a section, and the way the first one was looked was a fair sample of the rest. From the old witness-tree the line-runner ran—that is. paced-one hundred and twenty-five paces north, toward the center of the section. This carried him one-fourth of the way along the eastern edge of the forty, and gave him his real startingpoint. Then he turned at right angles and ran three hundred and seventy-five paces west, which carried him three-

MARKING UP A SECTION LINE

fourths of the way across the forty, at a distance of approximately three hundred and thirty feet from the section line which bounded it on its southern side. Then he turned north again, two hundred and fifty paces; and finally he faced due east and ran back three hundred and seventy-five paces to the edge of the forty from which he had started. he had walked around three sides of the forty at a distance of three hundred and thirty feet from each of them. As the distance between his westward and eastward paths was only six hundred and sixty feet, he had passed within three hundred and thirty feet of every square inch of the forty. In taking this threesided walk he had been guided only by his compass and had measured distances only by pacing, but so skilled was he in his work that in the whole distance he did not vary more than a few feet from his course.

The land-looker, meanwhile, had fol-

lowed close behind him, noting carefully the timber on either hand, and by the time they had finished he had a very close estimate of the amounts of lumber of different kinds that could be manufactured from the timber on the forty. Twenty thousand feet of beech, forty-five thousand feet of maple, fifty thousand of hemlock, seventeen thousand of birch, and one lone pine-tree. The next forty had a corner running down into the swamp, and there he found a quan-

they finished the section and did nearly half of another.

One of the other two land-lookers had a somewhat different method. Instead of following a three-sided course around a forty, he took a strip twenty-five paces wide clear across one side of it, counted the trees, and made a very careful estimate of their contents. Then he took a similar strip crossing the forty at right angles to the first one, added the figures for the two, and multiplied the result by

THE "RENEWED" BLAZE

tity of cedar ties and posts and a handful of telegraph poles, besides some fifty cords of spruce and balsam pulp-wood. The third was all hardwood, and ranheavily to birch—a valuable forty. The fourth was largely hemlock; and thus it went on through one forty after another.

The land-looker kept careful records in his note-book of everything he found, and at night, after returning to camp, he copied his figures on estimate-blanks which the timber dealer provided. He and the line-runner ran over twelve forties that day, and the day following ten. His estimate on that part of the forty which he actually traversed was probably a little more accurate than the first man's, for he passed closer to each tree, but a larger portion of the forty was untouched and was merely guessed at from the contents of the two strips.

Once we were fairly started, it was rather monotonous work. Each day ten or twelve forties looked by each land-looker, with so many thousand feet of hardwood reported, so many thousand of hemlock, so many ties, so many posts and poles, so many cords of pulp-wood, and now and then a little bunch of pine.

By the end of a week we had looked all that part of the tract that lay within a radius of two or three miles from the camp. Then one morning the wagon came for us, and we struck our tents, and in the afternoon pitched them again away over on the other side of the tract. The next day I started for home, and I had not been away five hours when the monotony was broken by an incident the like of which not one of those landlookers, line-runners, and timber dealers had ever before experienced—something which was almost as unexpected as the sight of an elephant or a man-eating tiger in the Great Tahquamenon Swamp would be-yet which may possibly happen again to any of them at almost any time.

The senior land-looker and his linerunner had separated for a few minutes, and in following up a section line the land-looker stepped up on to a fallen tree and from thence to the top of a brush-pile, looked down over the farther side, and saw, only a rod or two away, a group of eight wolves, all watching him with an air that was both interested and interesting. Why they did not run at the sight of a man, as well-regulated wolves ought to do, he does not know; but he thinks he heard a slight noise in the underbrush at a little distance, and he

has a theory that some young ones were getting out of harm's way and that the older animals were covering their re-However that may be, the wolves stood their ground until he shouted at At that they started off, but almost immediately they turned back and looked at him again. Then the largest three advanced a few feet toward the brush-pile, growling and snarling as they came, their teeth showing and the hair bristling along their backs, and in another moment the whole pack was making for The land-looker went up a tree faster than he had ever climbed before in all his life, and sat there on a limb, shouting to his line-runner at the top of his voice. The line-runner shouted in reply, and advanced slowly and with caution, and in a few minutes the wolves, perceiving that the enemy was about to be reinforced, and that the cubs were by this time out of danger-if indeed there were any cubs at all—left for parts unknown. The land-looker came down from his perch, and he and the linerunner resumed their work as if nothing had happened; but he will have a story to tell for the rest of his days—such a story as very few land-lookers can boast. Will he take a gun, I wonder, the next time he goes into the woods? I don't believe he will.

AMONG THE INSCRUTABLE INEVITABILITIES

BY ELIZABETH McCRACKEN

HRISTINE slowly glanced over the pages of the manuscript which her business manager had a moment earlier returned to her.

"It's in only three acts," she said, looking protestingly at the manager; "and there is no change of scene. I should need only one set of scenery "she again considered the manuscript— "'A garden;' a garden needn't cost very much." Christine paused, but the manager did not speak, and she continued: "And I should have to have only one dress; the whole action of the play takes place in one afternoon." The manager still was silent, and the actress added, "You see, there will be very little risk in producing it—though I should be willing to take a great deal of risk for Mary Gregory; she is my best friend."

"But," objected the manager, "she can't write a play."

He took the manuscript from Christine, and stared at it in perplexity. "She must have modeled it on the Greeks," he said; "it positively clings to the unities."

Christine smiled. "That's probably what she did—she is one of the lecturers out at the woman's college; she lectures on the Greek drama."

"H'm," murmured the manager; "the last person in the world who could write an actable play." He looked keenly at the meditative face of the actress. "Can't you see how hopelessly unactable it is?" he asked; "can't you see that it wouldn't run one night?"

"Yes," Christine reluctantly admitted, "I can, of course."

"Then why will you insist upon wasting your time and money by putting it on?" demanded the manager.

"Why," said Christine, "it's Mary's; she's my friend, and I'm hers—and she wants me to play it."

"Naturally," observed the manager, but I must say you reason about it

more like a boarding-school girl than a famous star, and a level-headed actress-manageress, at that."

Christine laughed. "Do I?" she said. "Well, we were boarding-school girls together, before I became famous and level-headed. She was good to me even then; I imposed on her dreadfully," she continued reminiscently, "but she always stood by me anyway—in everything, no matter what."

"That's no reason why you should produce her play," put in the manager. "And afterward," continued the ac-

"And afterward," continued the actress, as though she had not heard, "she was always more equal to my emergencies than I was myself. She stayed in the city one hot, hot summer when I was ill, and nursed me."

"Charming," commented the manager ironically, "but out of date. A trained nurse would have been less picturesque, no doubt, but just as effectual, I should say."

The actress looked at him. "I couldn't afford trained nurses then," she said simply; "it was before I was a famous star."

"But I still don't see why you should produce her play," the manager said, after a short silence.

"Don't you?" asked the star, with a faint smile. "I do."

"If it falls flat—and it will; I assure you it will—she will blame you. They are all like that, playwrights," remarked the manager.

Again Christine smiled. "Mary Gregory blame me! She never in her life blamed me for anything; she isn't likely to begin now."

"Devoted of her, I'm sure," returned the manager; "but in that case," he added quickly, grasping at a straw, "she might not blame you for not producing it at all."

"Oh, no," Christine agreed, "she wouldn't."

The manager stared. "Then why are you going to do it? Why don't you tell her it's no good, that it will fail?"

Ĺ

"She wouldn't believe me," explained the actress. "'They are all like that, playwrights," she quoted, with a laugh.

"How about Henry Wilkie? Have you overlooked the trifling fact that you signed a contract with him to produce that dramatization of his 'Silver Rings'—"

"Before the first of November. That leaves me a month and more in which to give Mary's comedy." She took the manuscript and read from the title-page, "'A comedy in three acts entitled "Now."' That leaves me plenty of time in which to produce 'Now,' "she repeated. "I can open my season with it."

The manager rose. "So you are quite determined to produce this piece of inconsequent frippery?" he demanded, in desperation.

"Quite," Christine replied, irrevocably.

The manager regarded her for an instant thoughtfully. "Then the parts had better be assigned at once," he said, without further comment. "How many are there?"

"Three—besides mine," said the actress. "It's not such a very hazardous venture, you see," she supplemented, consolingly. "Not much to do for my best friend, in the name of our lifelong friendship. She has done infinitely more for me. It's not much," she repeated.

The manager did not reply; but when he had left the actress, and was safely out of her hearing, he shook his head and ejaculated to himself, "Too much, by Jove! But women will be women, even the brainiest of them." The manager, it will be seen, was philosophical.

As for the star, she was not philosophical; stars seldom are. But she was exceedingly impulsive, and very generous, as stars often are. She was most charming, too, and very beautiful, and she acted remarkably; in short, she quite deserved the intense affection of her friends and the whole-hearted adoration of her public.

As soon as she was alone she took the much-questioned manuscript from the table upon which the manager had

dropped it, and, seating herself in a deep wicker chair, she read it for the third or fourth time from beginning to end. Then she leaned back in her chair and sighed. "It is so impossible!" she exclaimed; "and yet it isn't amateurish; it is even delightful in places; but—but it just isn't a play. Still, the least I can do is to put it on. If it fails, and it may; well, Mary is plucky. She won't cry over spilled milk!" The actress "Indeed she won't. She'll laughed. mop it neatly up, and begin to comfort me because I helped to spill it!" Her beautiful face softened and she smiled very tenderly. "Dear little Mary," she said, softly.

Dear little Mary, who in point of size was almost a head taller than Christine. and in regard to physical strength was at least her equal multiplied by two, took an absorbing interest in all the details connected with the preparations for the production of her comedy. The rehearsals began before the college year. Mary devoted her mornings to attending the rehearsals, her afternoons to outlining her forthcoming lectures on the Greek drama, and her evenings to dreaming dreams that would have given the manager a certain grim amusement, had he known, and dismayed Christine beyond words, had she known. Christine, indeed, found some cause for distress in the almost daily sight of Mary's rapturous face as she watched the rehearsals of her play. "If only it could succeed," the actress often and often whispered to herself: "if only it could! Mary is plucky—but if it only could succeed!"

"If only it could succeed!" she repeated to the manager, after the last rehearsal.

"But it can't!" replied the manager, gruffly. "I told you that in the beginning; yet you would waste your time, strength, and money on it. It will run one night. Then you'll have to rush Silver Rings on, without half enough advertising, and not much more than half enough rehearsing of the company. Henry Wilkie is already in a fidget over it. He doesn't say anything to you, but he bores me to death."

The manager's tone was aggrieved, and Christine smiled. "It's too bad."

Digitized by Google

she said. "But," she repeated once more, "I do wish Mary's play could succeed. "It goes pretty well at rehearsal!" she added, reflectively.

"Because there is so little to go," complained the manager. "A college dramatic club could make it go."

"And the company like the play," Christine went on, slowly.

"Because they think you do," explained the manager, shortly.

"And Mary is delighted-"

"She's a lecturer on the Greek drama. What on earth can she know about plays?"

Christine laughed; then her face became grave. "Poor Mary," she said, gently. "It will be hardest for her. It's her play, her first play, and she is so sure, so absolutely certain, that it's good. We are prepared for failure—but she isn't."

"Well, I can't see that I'm to blame," said the manager, a trifle impatiently. "I advised you, urged you, implored you not to give it."

"I know," Christine assented. "I'm not blaming any one—not even myself. It is one of the inscrutable inevitabilities of life," she added, pensively.

The manager found heart to laugh. "Indeed?" he said.

"It will be hardest for Mary," Christine thought as she lay resting, on the afternoon preceding the first performance of Mary Gregory's comedy in three acts entitled "Now;" "it will, of course, but it will be next hardest for me! I almost wish I hadn't decided to play it; it seems rather mean, letting her think it will succeed when it won't. I almost wish I'd told her it was utterly hopeless; I do-only she wouldn't have believed me. I wish-oh, I don't know what-I wish! Either that she had never written a play-one's best friends really shouldn't—or that it could succeed! I never felt so mean! And yet what could I do?"

She sighed, and, raising herself on her elbow, thumped the pillows of the couch into greater softness. Then, falling back among them, she closed her eyes and tried to sleep. But Mary's face came before her and would not allow her to discontinue her disturbing musings. "Poor little Mary!" she exclaimed, half aloud. "And in New York, too! I really should have planned to try it first—and last—somewhere else. Poor little Mary!" she said again, as again she pounded her pillows.

When Mary knocked cautiously at her door an hour later, Christine was still awake, still half-accusing, half-defending herself for that which she had described to the manager as one of the inscrutable inevitabilities of life. She welcomed Mary with even more than usual warmth. She kissed her several times, and would have helped her remove her hat and wraps, but Mary quickly performed these offices for herself. She took off her gloves, too, and fastened back a stray lock of her brown hair. Then she turned to Christine and laughingly pushed her down upon her pillows, tucked the gay silk blanket deftly around her, and, seating herself on the rug beside the couch, took one of Christine's hands in both her own.

Christine smiled to herself; Mary certainly had some of the ways of boarding-school girls! She looked at Mary thoughtfully. Mary was big and brown and eager and protective; she always had been. Christine herself was not very big, and she was fair-haired and gray-eyed, and less eager; but she too was somewhat protective.

It was perhaps this very protectiveness that led her to say as she contemplated her friend sitting on the rug beside her holding her hand, "Mary, dear, if it should fail!"

Mary smiled indulgently. "Oh, but it won't! You always expect things to fail—the afternoon before the first night." She rubbed her cheek against Christine's hand. "Don't say another word about it, dear, I know just how you feel," she added, gently. "You must rest, and try to go to sleep. Just let me do the worrying about its failing."

"I can't!" exclaimed Christine, with an emphasis at which Mary, not understanding, laughed outright.

"Can't you?" she said. "Well, anyway, you can go to sleep! And I must go home. Oh, by the way, dear, could I stay behind with you, to-night? You see, I've really seen it from the front so

often at rehearsals. I haven't got any relatives to go with—and a lot of the people from the college are coming. I'd rather be totally out of sight."

"So should I," groaned Christine to herself, but to Mary she said easily: "Of course. I know just how you feel. And I'd love to have you behind with me. Come early."

Mary went very early, but she found Christine already dressed, and sitting in her dressing-room, surrounded by masses of flowers. "First night flowers," said the actress; "what can I do with all of them? But you didn't send me any," she began, smiling with outward gayety but inward misery at Mary's shining eyes and happily flushed cheeks.

"I brought them," said Mary. 'Gentians; they are precisely the color of your eyes when you are excited." fastened them in Christine's gossamerlike white gown—that one gown which, as Christine had told the manager, was all that she should need for this venture, which was after all turning out so much more disastrously even than the manager had prophesied. "Mary is plucky; she won't cry over spilled milk," Christine had at the beginning repeated to herself for comfort. "I do wish it needn't be spilled," was the most that she could say to herself of comfort, as Mary pinned the gentians to her gown. "One's friends certainly ought not to write plays I" she added.

But she still said nothing of this to Mary; and Mary, with a tact which Christine had never so thoroughly appreciated, did not mention her comedy, which in less than half an hour was to be tried by her friend, because of their friendship, and found wanting.

The theater was crowded—but the theater always was crowded on Christine's first nights, especially in New York. Few of the people in the audience knew anything about the new play, but few of the people in any audience ever do know very much about the new play; few read the playwright's name on the programme; few ever do read it. The audience was very average, as Christine was well aware. It had come to see her act an actable play. She could act—she knew that; but her heart sank when she

thought of the play. She was generous even to the extent of feeling sorrier for Mary than she felt for herself.

She kissed Mary very tenderly when she left her for the first act of the comedy. At the end of the act, to her amazement, the audience applauded deafeningly, again and again. The act had gone pretty well—as well as it had gone at the rehearsals. The audience had accompanied it, not with bursts of mirth, but with quiet intentness, and soft, almost continuous laughter.

"Well!" whispered Christine to the manager, as she passed him on her way to answer her seventh curtain call.

"It's not the play; it's you," the manager said, briefly, but with distinct bewilderment.

"I suppose it's still me," observed the actress, ungrammatically, at the end of the next act, as she returned from her tenth curtain call, holding in her hand an American Beauty rose which Henry Wilkie, whose dramatization of his novel "Silver Rings" she had signed a contract to produce before the first of November, had tossed to her from his box

The manager looked dazed. "I don't know!" he replied.

Christine found Mary standing in the doorway of her dressing-room. "You say my eyes are the color of gentians when I'm excited," said the actress, touching the flowers as she spoke.

"Yes," said Mary, wonderingly, "and they are exactly that color now."

"Well, they ought to be!" Christine said, enigmatically.

The manager also appeared to be excited. He glanced at Mary in surprise. "She seems calm enough," he observed to Christine, just before the curtain rose for the last act.

"She didn't expect it to fall flat," Christine returned, as she went forward in answer to her cue.

The last act fell by no means flat. At the end, after prolonged and wildly enthusiastic applause, the audience demanded the author and a speech. The manager collapsed completely; Christine grew dizzy with sudden revulsion of feeling; the milk had not been spilled, after all! Mary had a bright red spot on each cheek, but she was by far the most self-possessed of the three. "Some-body make a speech," said the manager, weakly.

"I simply can't stand anything more," Christine declared; and so it was left to Mary to make the speech; which she did, clinging to Christine's hand. It was a very little speech, and no one in the audience heard a word of it, but they all applauded with ringing enthusiasm. Seldom had a play been a more brilliant success on its first night.

"It won't last," persisted the manager, even after reading the newspaper reviews the next morning. "It won't last." But it did.

One morning, about a month after that night, so amazing to every one immediately concerned, except possibly Mary, the manager called to consult Christine. Mary was with her, but she soon rose to go. "I have to lecture on Aristophanes at two," she explained.

"It is the twenty-first of October," said the manager the moment he was alone with Christine.

"Well?" queried the actress.

"You have that contract with Henry Wilkie; you have agreed to put on his dramatization of 'Silver Rings' before the first of November."

"Yes," acquiesced Christine.

"You had better get him to let you save it over for next season," said the manager. "You won't need any other play this year." He paused and looked at her quizzically. "I never was more

surprised in my life; it seemed such a hopeless play. I am glad you insisted upon giving it."

Christine smiled, and the manager added: "But if I remember correctly, you didn't insist because it seemed any more hopeful to you—"

Christine laughed. "You remember quite correctly," she said.

When he had gone she went to her desk to write a note to Henry Wilkie. But she did not write it at once. She sat smiling softly, her lovely face all happily aglow. "Dear little Mary!" she said. "She was always plucky—but I'm glad, so glad it succeeded!"

And the manager, hurrying down the street, also meditated upon Mary. "Aristophanes!" he muttered; "she had to give a lecture on Aristophanes. She is the most serene playwright I ever saw—and I've seen a few playwrights in my time. She takes her success exactly as she'd take a drink of water. It doesn't excite her a bit more. Well, women are "—he stopped and laughed—"what one of them calls 'inscrutable inevitabilities of life!' Aristophanes! Who was Aristophanes, anyway?"

Mary, meanwhile, was answering this question before her class in her lecture-room. Between sentences she thought about her play, and about Christine. "I knew it was good," she mused, but I wonder, I do wonder, if the manager, or even Christine herself, had any idea that it would be quite such a big, really big, success!"

Comment on Current Books

The Disassociation an account of the extraof a Personality ordinary psychical phenomena to which an unstable nervous organization may give rise. Psychologists record numerous instances of this. The stream of consciousness which constitutes personality and character, while normally single and identical, divides into double or multiple, so that in one person two or more persons with dissimilar traits—physical, mental, and moral -alternately appear, and the classic fable of Proteus is dramatized in real life. To the celebrated cases of this sort, another, as remarkable as any of them, is here added by an eminent physician, Dr. Morton Prince, of Boston. Since 1898 he has had under care a patient fictitiously named "Miss Beauchamp," an educated and more than ordinarily refined person, who permits him, in the interest of science, to publish this "biographical study in abnormal psychology," with sketches of the seemingly distinct personalities which carried on "a pathological drama" in her life. Her normal self, besides its modification in the hypnotic state, like a river which divides into separate channels, some through sand, some through rock, became for years disintegrated into several dissimilar selves, successively "born" and alternately dominant; viz., "Sally," a clever, mischief-loving creature; "The Idiot," and

"The Saint." Of these, "the Idiot," as "Sally" unjustly dubbed her, was more normal and healthy in mind and body than the real Miss Beauchamp. The social life which these two carried on by turns during intervals while the real Miss Beauchamp was suppressed was both comic and tragic. Finally, after long and baffling struggles, in which the sine qua non was achieved by the suppression of "Sally," Miss Beauchamp was "put together," and last summer the reconstruction gave hope of permanency. As a scientific study in an obscure field of research now being actively explored, Dr. Prince's work is one of interest. A full discussion of the questions involved is reserved for a following volume. (Longmans, Green & Co., New York. \$2.80, net.)

Half-Century
Messages

In this series of papers, mostly brief and all suggestive, Dr. W. C. Huntington, Nebraska Wesleyan University, presents to pastors and people a variety of subjects which seem to him to deserve more full and frequent treatment in the pulpit and in church literature than they receive. The papers on "Some Causes of Ministerial Unacceptableness," "In the Church, but Unconverted," "Christians and Money," are noteworthy as specimens. (Eaton & Mains, New York. \$1.)

A peculiarly gifted teacher of Kindergarten little children, Laura Ella Bible Stories Cragin, exhibits here her successful method of awakening their interest in the Bible through the narratives which are naturally attractive to them. Her book is a boon not only to kindergartners, but to parents who feel the duty of religious instruction in the home, and wish to acquire the best method of its beginnings. series, which ends with the story of Ruth, deserves continuation in another volume. (Illustrated. The Fleming H. Revell Company, New York. \$1.25, net.)

A Maker of few equals in the concoction History of an exciting plot, and his new tale is really remarkable in the ingenuity and consistency with which the complications are managed. It starts with a singular incident-the accidental witnessing by a young Englishman of a secret meeting between the Kaiser and the Czar, and his finding a single sheet of paper blown about by the wind but containing a secret of enormous international importance. The possession of this document involves the ingenuous youth, and later on his sister and two aspirants for her hand, in an extraordinary series of adventures with spies and secret police, and in the end averts a great war which the Russo-German secret

alliance would have otherwise precipitated upon England. Very clever use is made of the North Sea affair, and fiction is dovetailed into recent history in an exceedingly deft fashion. Altogether the romance is an exceptionally good specimen of sensational story-telling. (Little, Brown & Co., Boston. \$1.50.)

This tenth volume of the Luther's Church new and standard edition Postil Gospels of Luther's works contains his Advent, Christmas, and Epiphany sermons, first published in Latin in 1521, and dedicated to his protector, the Elector Frederick. Translated immediately into German, they now appear for the first time in English from the hand of scholarly translators, and the editorship of Dr. J. N. Lenker, of Minneapolis. Luther's postils, i.e., homilies, on the Gospels are esteemed the best of his sermons. (Lutherans in All Lands Company, Minneapolis. \$2.25.)

With its wealth of illus-Penrose's tration, both in color and Pictorial Annual in black and white, and its careful description of technical processes, this book will be of special interest and value to photographers and illustrators. It embodies a review of the progress of the graphic arts for the year, more especially as regards their photo-mechanical reproduction. Many photographs are here reproduced by the three-color process, and in some cases these show an advance over previous work, though, as the editor, Mr. William Gamble, well says, "much of the three-color work of to-day gives one the feeling of something wanting." (A. W. Penrose & Co., London; Tennant & Ward, 287 Fourth Avenue, New York City. \$2.50, net.)

In this monograph Dr. Lynn The Place of Thorndike, sometime Uni-Magic versity Fellow of Columbia, limits his inquiry concerning "the place of magic in the intellectual history of Europe" to the Roman Empire, as summing up and transmitting to the mediæval age the views of the ancient world. Magic, defined as primitive man's attitude to Nature, is used as a class-name, including a variety of beliefs and practices, such as astrology, divination, necromancy, belonging to the realm of occult knowledge. Reviewing the statements of educated men, Cicero, Pliny, and others, Dr. Thorndike finds no instance of consistent disbelief in magic. The noteworthy point in the résumé is that magic among the educated was always associated with science, and is related to it as the guesses of the child to the positive knowledge of the man. (The Macmillan Company, New York. 75c.)

Letters to The Outlook

OBJECTIONS TO JOINT STATEHOOD

[Greatly to their honor, several subscribers in Arizona have written letters in behalf of that Territory. The following utterances have been selected from their communications, as they include practically all the arguments advanced against joint Statehood. We note, incidentally, that if the illiterate Indians be excluded from the list of impediments to Statehood, they should not be included in the number of inhabitants which is considered sufficient for Statehood. It is noteworthy that our correspondents agree in preferring the Territorial status to joint Statehood. There is much force in the contention that the people of Arizona have a right to remain a Territory if they so desire, but none in the claim that they have a right to determine whether, if admitted, they shall be admitted separately or in conjunction with another State.—THE EDITORS.1

New Mexico's population is twice Arizona's. One-third New Mexico's population neither reads, writes, nor speaks English. Another third is Spanish-American—technically, a euphuism for Mexican. You in New York have a percentage of Italians or Hungarians or Slavs. In the New Mexican Legislature in the last ten years Americans-i.e., not Mexican or Spanish-American persons—have predominated once. Would you call it sentimental attachment to a locality in which one's interests lie that stands in the way of a harmonious co-operation with one's so distant neighbors when the chance for political equality or a voice in the administration is so small as the suffrages would allow? Or would it be a matter of dollars and cents? It is the life of a community to have some voice in the disposition of the money it pays the State in taxes; the prospect of such voice after jointure with New Mexico is too slight to be given serious consideration.

Arizona is sorry that Statehood was ever mentioned. Arizona has had enough Statehood already. Arizona refuses to admit that the Nation's interest requires of her such sacrifice; for jointure would deprive her of the last vestige of hope.

> GUY L. JONES, Secretary Harvard Club.

Mesa, Arizona.

I do not care to argue for the admission of Arizona as a separate State at this time, nor to try to refute your argument that the admission would give it a disproportionate power in the Senate. The justice of that statement is indisputable. But I do protest against making a bad matter worse by linking us to New Mexico and forcing on us a Statehood condition which not one-tenth of the people desire. On the contrary, they vigorously oppose it. Your fear of railroad interest predominating in the politics of the State is unfounded. The Territory has suffered too much and too long from discrimination in rates against it to support railroad interests. The mining interest undoubtedly predominates, but is not so disreputable a business or so grasping as to be utterly condemned. Our big companies in Arizona are run by a class of men who will compare favorably with the captains of industry in any walk of life. GEORGE B. CHITTENDEN.

Saddle Mountain Mining Company, Christmas, Arizona.

C: 1

Ultimate single Statehood for Arizona is largely a matter of sentiment. It is a manifestation of the sentiment which every man has for family; which most Americans hold for their State; which we all have for our country. In a word, it is local patriotism. Arizona is young-forty years covers her Territorial history-but Arizonans have a pride in her past and unbounded confidence in her future. Arizona is not now asking for Statehood. Whether or not she should be admitted as a single State is not the present issue. At this session a portion of the Congress of the United States is in favor of joining Arizona and New Mexico and admitting them now as one State. Arizona is opposed to the jointure, and rather than accept it would prefer to remain a Territory indefinitely. The issue, then, from an Arizona standpoint is: "Is Arizona entitled to remain a Territory and further develop her resources until fitted to be erected into a State, or must she, without opportunity to voice her wishes, be now joined to New Mexico and lose her autonomy?"

It is true that Statehood is a National question and that Arizona is not alone to be considered. Nevertheless, it is easy for the East to do the West an injustice which may possibly result disastrously to the future of the Nation. Granted that at present it is unfair to admit Arizona, with less than 200,000 people, to equal representation in the United States Senate with New York or Pennsylvania, can it be now foretold what its population will be fifty or one hundred

years hence? It may well be that at the end of fifty years the excess of power in the East in the Senate by reason of numerous small States will give to the West with its few States of large area just cause for complaint; and that then the ratio of representation of Rhode Island, Delaware, Connecticut, or Vermont will be as unfair to California, Oregon, Washington, or even Arizona, as that of Arizona would be now to the more populous Eastern States. Fifty years just passed has seen a wonderful growth in all sections of our country. May not the next fifty be as great? Illinois had hardly a white person in 1810—Arizona hardly one in 1860. Who can tell the population of Arizona fifty years hence?

Arizona's present interests, it is charged, are largely mining. True, but mining is not the only resource. The entire area of the State of Rhode Island is not the one-half of the farming land in Arizona. (Statistics of Agriculture, Vol. 5, Twelfth Census, table 19.) Without cumbering this letter with references, it is fair to say, while the Twelfth United States Census shows Arizona as ranking fourteenth among the States in mineral products, it ranked higher than fourteenth in timber lands, in sheep, and in cattle. It is only because of the munificent mineral endowment of this Territory that the other and less noticeable resources are lost to sight.

It is also true that Arizona's average of illiteracy is twenty-nine per cent., as stated by The Outlook. But it is disingenuous for The Outlook to withhold the fact that this percentage is based upon figures which include 22,000 Indians, not voting, out of a total of 123,000 people, and that these Indians are almost wholly illiterate. "Table 57. Illiterate population at least ten years of age," Abstract Twelfth Census, tells the following tale:

	White.		
State or Territory.	Total.	Native.	Foreign Born
Arizona	. 29.0	6.2	35.2
New Mexico	. 33.2	29.4	34.8
Massachusetts	. 5.9	0.8	14.6
New York	. 5.5	1.2	14.0
Virginia	22.9	11.1	10.9
Illinois	. 4.2	2.1	9.1
Alabama	. 34.0	14.8	9.3

Table 56, idem, is also interesting:

Population attending school, p. 73, Abs. Twelfth Census, 1900. Per cent. of population of school age attending school:

State or Territory.	Total.	White.	Negro.
Arizona	. 44.1	50.4	39.7
New Mexico	40.6	41.5	42.9
Massachusetts	. 58.5	58.6	51.8
New York	53.9	54.1	40.9
Virginia	. 42.2	48.1	22.8
Illinois		54.6	46.9
Alabama	. 32.3	40.5	22.8

As to the charge that the population of Arizona is fluctuating, the only answer possible is a flat denial, with a reference to the United States Census, which shows a steady, healthy growth during the forty years of its life.

That the Mormon Church is the controlling, or a possible controlling, element in the voice of Arizona may be met with the statement of The Outlook itself: "To admit Arizona . . . is to admit Senators to the United States Senate . . . and it is probably to give threefourths of that power . . . to certain railroads and mining interests, the paid advocates of which they would be." And this quotation calls to mind the charge by The Outlook that "there are very large and not altogether scrupulous special interests concerned in securing the admission of these four Territories as separate States. These are railroad and mining interests. They are already very influential, if not absolutely controlling, in Arizona, New Mexico, and Indian Territory.

... The railroad and mining interests would control two and probably three of these States, and thus secure four, if not six, Senators in a body which is already quite too much under the influence of the advocates of special interests."

It is easy to make charges of this character and impossible to refute them. It is patent, though, that they lose much force on considering that the new States, if these statements are true, would be in no worse plight than some of the Eastern States. Let us be frank: Who controls the railroads and mines-Eastern or Western men? It must be conceded, Eastern men. Who, then, is to blame for the corruption-Arizona or the Eastern capitalists? And is Arizona to be blamed for sending advocates of special intelligence to the United States Senate when the seven millions of New York are so represented, when the six millions of Pennsylvania are so represented, when Maryland, when New Jersey, when Rhode Island, and when Delaware are so represented?

This last quotation is hard to reconcile with the statement made in the second article in The Outlook: "It seems rather strange that the rich mine-owners of Arizona should be here fighting Statehood, either single or joint; but the reason for it is not far to seek. They own the Territory now. They own it. They are lords of the estate. Naturally, they do not want to run any risks by a change to Statehood." Why not, forsooth, if they are to dominate the State? At present the Territory is ruled by Washington. Why, if there is injustice done in taxation in Arizona, does not Congress, with its plenary power, right the wrong? Are not our courts

appointed by the President? Is not our Governor? Is not the whole Territorial machinery Federal? It must be that the mine-owners' protection is Washington, not Arizona, and that they are content to let it so remain.

Every argument that The Outlook has advanced is one against the present admission of either Arizona or New Mexico. It has urged the sparseness of our population, the illiteracy of our people, the domination of special interests, the injustice of equal representation in the Senate. Whatever merit there may be in the arguments, it suffices to say that the political injustice to the Nation cannot be lessened by uniting two Territories, each unfitted for Statehood, and bringing them in as one State.

Arizona, as was said before, does not now ask for Statehood. It has reasons which justify the confidence of its people in its ability to demonstrate its fitness for Statehood in another decade. It has within its borders more land susceptible of cultivation to ordinary crops than Pennsylvania, more timber lands than Maine ever had, more sheep and cattle than a majority of the States east of the Mississippi, and, as far as can now be determined, more mineral wealth than any of the States. It has its own system of laws and its judicial decisions. It has its own Capitol, its University, and its eleemosynary institutions. It has both the finest winter climate, at Phœnix and Tucson, and the finest summer climate, at Prescott, Flagstaff, and the Grand Cañon, in America.

It is not mere sentiment alone that causes Arizona to ask consideration in this matter. There is a radical difference between the laws of New Mexico and Arizona. A union with New Mexico entails the probable adoption of a constitution framed to best serve New Mexican interests, an enforcement of New Mexican laws in Arizona, the domination of New Mexican ideas in future legislation, and the substitution in Arizona of a Latin in place of Arizona's present Anglo-Saxon civilization. It means a practical extinction, for years to come, of Arizona's voice in the affairs of state. Who in Arizona can or would view such an outlook but with alarm? Arizona asks of the American people and of their representatives in Congress that fundamental right of American States to a voice in the determination of their future that the people of Arizona may vote separately, and the action of a majority of its voters be controlling upon the question of jointure with New Mexico.

E. W. Lewis

Phoenix, Arizona,

READING MATTER FOR PANAMA

I venture to address you on behalf of the men who work on the Panama Canal. Of course you know that there are thousands of the very best Americans employed there as engineers, as superintendents, as constructors, and in various capacities. It is also known that these men in the treacherous climate prevailing on the Isthmus are exposed to peculiar dangers and liable to be stricken at short notice. To receive those who appear to be threatened with malaria or yellow fever, and to treat those who are actually in danger, large hospitals adapted to receive hundreds of patients have been established. The one thing needed in these hospitals is reading matter. I have been informed that the greatest agony to which these patients are subjected is to be confined in the hospitals for days and weeks, and to have nothing to read.

I do not know who better to ask to start proper proceedings toward supplying the hospitals of Panama with reading matter than The Outlook. I should think, of course, that some steps should be taken, not only to supply reading matter at once, but also to supply current literature from time to time. It can hardly be expected of the Government to do this. I remember that during the Civil War, when I was at the front, the boys were being supplied with reading matter, not by Government, but by properly organized private subscribers. I remember also what a boon it was to receive these wondrous magazines in places where, but for them, nothing but hardship, disease, or death stared us in the face. The impressions given by well-written treatises upon men thus situated are deeper and more far-reaching and beneficial than could be produced upon men actively employed in centers of civilization. I hope that through your assistance some measures may be taken towards meeting the justifiable craving of our fellow-men for the highest kind of food.

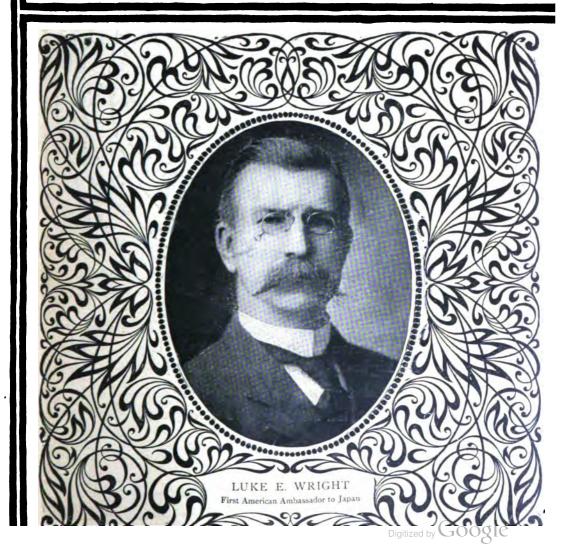

Reading matter should be addressed to the "Director of Hospitals," Ancon, Canal Zone, Isthmus of Panama. Packages weighing not over four pounds may be sent by mail to the Zone at the domestic rate of postage. Packages exceeding that weight may be similarly addressed, but sent through the Panama Railroad Company, 24 State Street, New York.

ARTHUR V. BRIESEN.

[An excellent suggestion. We urge our readers to aid in this by sending reading matter to the address above given.—THE EDITORS.]

PRICE TEN CENT

The Kelly-Springfield Tire

The keynote of good tire service is good rubber. Good rubber is expensive, but not too expensive or too good for the Kelly-Springfield Tire. Always found on the highest priced carriages. It helps to justify the price.

Booklet, "Rubber Tired," for the asking.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

LETTERS should be addressed:

The Joint Statehood Bill has passed the House of Representatives by a set of 105 to 150

sentatives by a vote of 195 to 150. Prior to this action the House adopted a rule reported from the Committee on Rules which limited the debate to fortyfive minutes on each side, and provided that no amendments to the bill should be permitted. The bill, as passed, provides for the admission of Oklahoma and Indian Territory as one State, and Arizona and New Mexico as another The people of these Territories are first to vote on the question whether they wish admission. That is, the bill is an enabling act, authorizing the people to prepare a State Constitution as a preliminary to admission. But the people of the Territories are to vote jointly. not separately—that is, Indian Territory and Oklahoma vote as one Territory, and Arizona and New Mexico vote as one Territory. If, therefore, a majority of the people of the Indian Territory do not wish to come in as a State with Oklahoma, Indian Territory may nevertheless be compelled to come in, if a majority of the entire population favor joint Statehood; similarly, if a majority of the people of Arizona vote not to come in, Arizona may be compelled to accept joint Statehood if a majority of the two Territories of Arizona and New Mexico desire it. The enabling act for both the joint Territories constitutes one bill, so that in the House no one could vote against the admission of the one joint State without voting against the admission of the other. And as no amendments were allowed, the sense of the House was not taken on the question, Shall the people of each Territory vote separately? nor was any member allowed to vote for the admission of the one State and against the admission of the other. There seems to be little doubt that a majority of the population of Indian Territory and Oklahoma desire joint Statehood, though there is some objection in the Indian Territory on behalf of the Indians, whose rights it is feared will not be sufficiently protected under State laws, and who cannot be protected from the liquor traffic by the Federal Government after they have become citizens of the State and of the United States. But, as our readers know from the correspondence which has been published, there is very strong objection in Arizona to being united in the same State with New Mexico.

●

The Measure and the Method

The Outlook believes in joint Statehood. We do not think it practicable

to keep Arizona permanently a Territory. From the best light we can get on the subject we do not think it likely that it will ever support a population sufficient to justify giving it two Senators in the Senate of the United States. We think the peril to the Nation from another thinly populated and corporation-ruled State is greater than the peril to Arizona from a union of her destinies with New And while there is serious objection to requiring Arizona to come in as a State with New Mexico against the will of her people, there is also serious objection to keeping New Mexico out as a State for no other reason than that Arizona does not choose to come in, though it might be wise to keep both Territories out until they can agree to come in together. Our belief in joint Statehood may perhaps help to emphasize our protest against the method in which this measure was carried through the House. That some limit should be put upon the debate of such a measure is true; without the previous question the House would be powerless to transact

Digitized by Google

That some limit should be put upon amendments is also probably true, otherwise a few unscrupulous obstructionists could practically prevent legislation. But to cut down debate on so important a measure to an hour and a half, and to refuse permission to introduce bona-fide and important amendments, is to destroy the power of the House to consider business under guise of giving it power to do business. So long as the House abdicates its right to give serious consideration to public measures, so long it may expect to be subordinate in public esteem and in real political power to the Senate. A legislative body whose interminable debates generally lead after a time to some kind of action will be regarded by the people as more truly deliberative, and therefore more worthy of respect, than one which never deliberates and acts only to record the judgment of party leaders.

3

Pure Food In the Senate last week Mr. McCumber, Senator from North Dakota, stated succinctly the justification for a Federal pure food law. The Government, he said, "cannot prescribe a dietary course for every individual," but, he added, "it ought to protect the individual against all character of imposition and fraud, so that entering into the markets he may purchase those things without fear which he knows to be conducive to his health and comfort, and above all that he may avoid those things which he knows to be detrimental." Senator McCumber then cited an illustration from a statement made by a State Secretary. A woman entered a grocery store and bought some articles of food. The price amounted to \$1.80, and as she had only \$1.57, she went away indebted to the grocer twenty-three cents.

Mr. Allen immediately purchased a quantity of each of those articles and analyzed them. He found the syrup was seventy per cent. glucose, the jelly contained nearly everything but fruit juice and was colored with coal-tar dye, the sausage contained an antiseptic, and the lard consisted of beef stearin and cotton-seed oil mixed. Had she gone into the market and bought those articles for what they were at the very highest retail prices, they would not have cost her

over ninety cents, and she would have gone away with sixty-seven cents in her pocket instead of being indebted to the grocer twenty-three cents; and this, Mr. President, independent of the fraud that was perpetrated upon her, independent of the coal-tar dyes which her children were compelled unconsciously to consume.

Against this condition the State laws are a feebly inadequate defense. They cannot prevent fraudulent manufactures from being imported, or from being transported from one State to another. burn bill now before Congress makes the manufacture of and inter-State traffic in deleterious, adulterated, and misbranded foods, liquors, and drugs punishable by fine and imprisonment. It differs somewhat in detail from the bill of last session. It puts the burden on the manufacturer; it relieves the dealer of responsibility, unless he "knowingly" receives such prohibited goods, in which case a guaranty of purity from the manufacturer will be evidence of good faith; it provides for regulations to be drawn jointly by the three departments of the Treasury, Agriculture, and Commerce and Labor, thus relieving the Department of Agriculture (which according to the bill last year would have made the regulations) of sole power; it makes separate provisions for foods, drugs, and liquors: it defines what shall legally be regarded as adulterations, as deleterious substances, and as misbranding. Nearly all States have pure food laws. This indicates how public sentiment regards the sub-Those liquor dealers, druggists, and food manufacturers whose business will be injured by the greater security of the people ought not to be suffered longer to delay and obstruct the passage of this bill.

Federal Supervision of Corporations

No subject under consideration by the present Administra-

tion yields in importance to that of Federal supervision of corporations. To this end a bill has been reintroduced by Representative Littlefield, of Maine, in the House of Representatives, providing the essential of such supervision, namely, publicity of accounting. Under the operation of Mr. Littlefield's bill, now, we are clad to say, favorably

reported, a great corporation such as the Standard Oil Company, the American Sugar Company, or the United States Steel Corporation would be obliged to make a report every year to the Commissioner of Corporations, giving its name, date of organization, when and where organized, statutes under which it is organized; if consolidated, naming the constituent companies and giving information regarding their organization; if reorganized, naming the original corporations, with full information in regard to them; the amount of authorized and issued capital stock and bonds; the amount paid in and how much; the amount paid in cash or in property. description in detail of the property so represented, with its cash value; whether there has been any capitalization of earnings or earning capacity; finally, the names and addresses of officers, managing agents, and directors, and copies of all rules, regulations, and by-laws. This is all good; still there are some things not provided for in Mr. Littlefield's billfor instance, annual reports of assets and liabilities. Such a provision would be welcomed, not only by radical legislators, but by many of the large corporations themselves. This is the kind of publicity which has been favored, for example, by the United States Steel Corpora-But the bill as it stands, if passed, would mark a most important step in material and moral betterment, for it is a direct blow at the chief evil of our so-called "trusts," namely, over-capitalization. The evil is generally acknowledged. but it is idle to wait for the several States to pass anything like uniform legislation on the subject. One phase of it is well stated in the following paragraph from the report of the House Committee:

If a capital stock is all paid in, the corporation doing a large and profitable business, and having accumulated a handsome surplus, the greater the publicity that is given to these important facts, the more the market value of the stock will be increased. Such a corporation seeks publicity. On the other hand, suppose the stock is only partly paid in, the corporation doing a losing business, and having accumulated a deficit. The more these facts are known the more the market value of the stock becomes a negligible quantity. In other words, if a man has a

good bond or stock, the more publicity he gets the better he likes it. If he has a poor bond or stock, the less publicity he receives the better he is satisfied. But why are not the public, the insurance companies, and the savings banks, which are relied upon as the final depositories of these securities, entitled to the same information in each case? A sound corporation will make no objection to such publicity; an unsound one always objects. The States, or some of them, legislate so as to enable the corporation to place the questionable bond and stock upon the market under apparently the same conditions that obtain in case of a first-class security.

On Saturday of last week Railway Rate Chairman Hepburn, of Legislation the Inter-State Commerce Committee, had the notable honor of reporting to the House of Representatives his railway rate bill with the favorable recommendation of the entire Republican and Democratic membership of that Committee. Thus upon perhaps the most important piece of economic legislation which has been attempted for years, and upon a question which could be made political and partisan, a unanimous report has been secured. Such unanimous report will doubtless have its due effect not only in the House, but also in the Senate, moving the latter body to earlier action than would otherwise be the case. Some intense Republican partisans are complaining; they would make capital for their party first and their country second out of every measure which passes Congress. Most Republicans, however, are pleased, declaring that the agreement was effected for the sole purpose of bringing the Democrats in the Senate into line for the Administration measure. The Outlook has already outlined the Hepburn bill as presented to the Committee. As presented to the House in amended form it is practically the same measure, made up from the nineteen railway rate regulation bills which were before the Committee, and also from the information contained in five volumes of hearings before the Senate and House Committees. of the changes were made on suggestion of minority members, and were granted, as no principle was involved. Others had already been made at the instance of Messrs. Esch and Townsend, the authors

of the bill which passed the House of Representatives last winter; these were certain charges of phraseology, the insertion of a section of the original Act as amended by the Inter-State Commerce Commission, and the reduction of the number of Inter-State Commerce Commissioners from nine, as in the Hepburn bill, to seven, as in the Esch-Townsend bill; finally, they also applied the Expediting Act to proceedings in the Circuit Courts, and made it mandatory upon the Attorney-General to file the necessary certificate giving priority in the Supreme Court as well as Circuit Court over all except criminal cases. The Hepburn bill, as reported, is satisfactory, though not as broad as many would have liked. For instance, the revised Esch-Townsend bill gave to the Inter-State Commerce Commission the power to fix not only a maximum rate, but also, for the purpose of differentials, a minimum rate. It is conceivable that there may be almost as much trouble from the minima as from the maxima.

₩

The Special Provisions

No attempt is made to authorize the Inter-State Commerce Commission to readjust freight classification. Little complaint, it is said, has been heard against classification. Jurisdiction is confined to cases where complaint has been made, when the Commission is authorized to declare what shall be

a just and reasonable and fairly remunerative rate or rates, charge or charges, to be thereafter observed in such case as the maximum to be charged; and what regulation or practice in respect to such transportation is just, fair, and reasonable thereafter to be followed, and to make an order that the carrier shall cease and desist from such violation to the extent to which the Commission find the same to exist, and shall not thereafter publish, demand, or collect any rate or charge for such transportation in excess of the maximum rate or charge so prescribed, and shall conform to the regulation or practice so prescribed.

This order is to go into effect thirty days after notice to the carrier, and to remain in force unless suspended, modified, or set aside by the Commission or court of competent jurisdiction. It is explained that the word "maximum" was used in

order that flexibility might be given to the rate, and that the carrier might charge a less sum than that fixed by the Commission. The Commission is also empowered to fix the maximum allowance to a shipper who furnishes his own cars or any instrumentality of transportation. Authority is given to the shipper to apply to the Circuit Court for the enforcement of the Commission's orders. The court is to enforce this order by means of injunction. Authority is given the Commission to prescribe the exact manner in which reports shall be made by common carriers, and the manner in which railways are to keep their accounts, with a penalty provision against non-compliance. Access is to be had at all times to the books of the carriers. The bill provides for two additional members of the present Inter-State Commerce Commission-two less, however, as above noted, than in the Hepburn bill as first presented. The term of service for a Commissioner is to be increased to seven years and the salary is increased to **\$**10,000.

The Labor Problem at Panama

In a recent address the Chairman of the Panama Commis-

sion, Mr. Shonts, declared that the "character of labor employed on the Isthmus has more to do with the time it will take to build the canal-more to do with the cost of construction-than any other determining factor." One of the difficulties of dealing with this labor question at Panama has been the legal application to the Canal Zone of the United States eight-hour law. This will be obviated if the Senate shall concur with the action of the House last week. By a vote of 120 to 108 (the unpaired absence of a large number of members was noticeable) the House passed the Urgency Deficiency Bill, carrying over \$15,000,-000, without any change whatever as to its financial provisions, but with an amendment to the effect that the eighthour law shall not apply to alien laborers on the Panama Canal. enactment is just and reasonable. is quite consistent to hold that the limit of eight hours for the normal day's work is a proper protection and a benefit

to the American workers to whom it was designed to apply, and yet to believe that it would be undesirable and the reverse of a benefit if it should be enforced at Panama: Apart from the matter of labor cost, it must be noted that American white laborers will not go to the Isthmus in great numbers, and would not in any case be desirable for work in that climate: it is doubtful also whether negro labor from our Southern States can be obtained to any large extent; finally, there is not on the spot any adequate supply of labor. must be brought, therefore, from a distance. Thus far Jamaica and Martinique have been the main sources of supply, but experiments are now being tried with laborers from the north of Spain, such as were used to advantage in constructing Cuban railroads. The negroes now at work on the Canal never heard of an eight-hour law, are not brought into competition with American labor, and do not understand or like the plan of short hours and hard work. The last is not altogether due to indolence, for it is a perfectly recognized fact that labor under a tropic sun and in a humid climate must be carried on in an entirely different way from that possible in the temperate zones. It would be neither sensible nor practical to attempt to enforce an eighthour law on the Isthmus. Equally proper is the decision of the Commission to let out portions of the work to large contractors; whenever there is an economic advantage to be gained there can be no objection to following this course, provided that the contracts be so drawn that the United States shall be able to enforce law and order, sanitary regulation and proper living, and to protect workers from oppression. On the other hand, the human and personal rights of the laborers must be carefully guarded. Coolie peonage or any form of contract labor which makes of the workman a semi-slave, or limits improperly his power of making labor contracts for himself, must not be tolerated or made possible by evasion. The Constitutional rights of labor in this respect have been well defined, and it is not likely that even the urgency of the enormous task before us at Panama will induce Congress or the Commission to try to let down the bars against involuntary servitude.

₩

Joint Conference
of Anthracite Operators
and Mine Workers

The acceptance by the anthracite operators of the hard-coal mine

workers' invitation to meet the representatives of the latter in a joint conference, to determine upon the general labor conditions which are to prevail in the coal industry following the expiration on March 31 of the award of the Anthracite Coal Strike Commission, is another important step in the direction of establishing the trade agreement machinery for settling upon wages and conditions of employment. The date agreed upon for the conference is February 15, and the place of meeting will probably be New York City. This is the result of efforts of the special committee appointed for this purpose by the convention representing the three anthracite districts held at Shamokin in December. While the text of the correspondence has been withheld from the public, it is believed that the anthracite-carrying railroad presidents and independent operators make clear that in holding such a conference it is with representatives of the hard-coal mine workers as employees and not as members of the United Mine Workers of America, a distinction which the operators have insisted upon from the beginning. But this distinction is more nominal than real, inasmuch as the representatives of the anthracite employees in the conference will be the duly chosen officials and committeemen of the mine workers' union, and they will no doubt be content with this substance of recognition. President Mitchell, the official head of the United Mine Workers of America, who is to be at the conference as a representative of the anthracite employees, is not likely to force to an issue at this time the form of recognition, and in consequence we believe the public can rest assured of an outcome to the negotiations which will maintain industrial peace. Thus, after a lapse of more than thirty years, it seems probable that the anthracite coal industry is again to enter upon the experiment of regulating the relation of employers and employees by means of the trade agreement machinery, but this time under conditions more favorable to its permanency. Under the able leadership of John Siney, the head and guiding spirit of the Workingman's Benevolent Association (afterwards known under a charter as the Miners' and Laborers' Benevolent 'Association), the trade agreement machinery was first established in the anthracite industry in 1868, and continued in operation until about 1874. The agreement covering wages and conditions of employment was entered into annually in a joint conference between duly elected representatives of the Association and of the Anthracite Board of Trade of the Schuylkill Coal Region (the organization of the operators), its principal feature being the sliding scale, an arrangement governing wages very similar to the sliding scale award of the Anthracite Coal Strike Commission, and after which the latter is patterned. This early trade agreement machinery in the anthracite coal industry gave to us what is believed to be the first signed joint agreement in the coal-mining industry of the United It was entered into between representatives of the two interests at a meeting held at Pottsville in 1870. But this early trade agreement machinery was naturally crude, and was further weakened by Siney's withdrawal from the leadership of the anthracite miners to become the head of the Miners' National Association. Neither the operators nor mine workers were organized sufficiently to assure its permanency; industrial conditions upon the entrance of the railroads as mine-owners were unfavorable to its continuance, and, combined with the bloody depredations of the "Molly Maguires," tended to its overthrow, the last joint conference between employers and employees in the anthracite industry being held in 1874.

8

A Favorable
Outlook

Present industrial conditions are more favorable to the successful operation of the trade agreement machinery once it is re-established in the anthracite in-

dustry. Both the mine workers and the operators are more strongly organized than in the former period; the trade agreement machinery itself has been greatly improved during the past quarter of a century; and social organization as well as industrial conditions, particularly along the line of production, emphasize to-day more than they did in 1870 the absolute necessity of some such method for insuring industrial stability and the peaceable conduct of our great industries. Besides, the public has been educated in industrial affairs to a point where it will demand in the future that methods other than brute force or strikes shall determine and govern the relations between employers and employees. Such a prospect for the anthracite industry is further forecast by prevailing conditions in the central competitive soft-coal territory (Ohio, Indiana, Illinois, and western Pennsylvania), where the trade agreement plan has been in successful operation since 1898. The eighth Inter-State Joint Conference representing the mine employees and operators of these States is now in session at Indianapolis for the purpose of entering into an agreement for the scale year beginning on April 1. In this Conference the United Mine Workers is recognized as a contracting party, and the agreement is signed by its officials on behalf of the mine employees of this territory. The policy the miners' officials are to follow was, in fact, formulated by the Convention of the United Mine Workers which met at Indianapolis ten days previous to the assembling of the Conference. This organization now exercises jurisdiction over both anthracite and bituminous coal mine workers, having a total membership exceeding 304,500, of which number over 80,000 are hard-coal mine employees. Ten years ago, in 1896, the total membership of the organization was only The present strength of this 9,617. trade union is further indicated in Secretary Wilson's announcement at the Convention, that the various treasuries— National, district, sub-district, and local -contain more than \$2,680,000. the support of its members engaged in strikes the past year in the coal fields

of Pennsylvania, Alabama, Tennessee, West Virginia, etc., the union expended more than \$753,724. The referendum vote of the members resulted in the reelection of John Mitchell as President, who thus enters upon his eighth consecutive term as the head of one of the largest and strongest trade unions in the country.

Chicago's Municipal Ownership Fight Mayor Dunne, of Chicago, is at last having his own way with his municipal

ownership programme. The City Council, which has heretofore been in opposition, has suddenly veered to the Mayor's side, and on January 19 it passed two ordinances which the Mayor has been advocating. One was to authorize the issue of \$75,000,000 in Mueller Law certificates for the purpose of purchasing or constructing a municipal street railway This ordinance will go to a referendum at the April election, and if approved by popular vote will thereupon be in effect. The other ordinance provides for submitting the question of municipal operation, which under the Mueller Law must be placed before the electors as a separate proposition. In order to carry, the municipal operation proposition must be supported by threefifths of those voting thereon. ordinance authorizing the issue of certificates will go into effect if approved by the majority of those acting thereon. This sudden action upon the municipal ownership ordinances came as a surprise to Mayor Dunne as well as to the community, and is the culmination of a bitter fight that has been waging between the Mayor and the Council. Mayor Dunne did not from the outset display great tact or conspicuous executive capacity in giving effect to his plans. He was soon at war with the Council, the majority of which openly took issue with his various municipal ownership plans and proceeded to negotiate franchise-renewal ordinances with the existing companies, intending to submit the ordinances to popular vote before they should become effective. The ordinances as drawn carried a twenty-year franchise renewal, with a reservation to the city of the right to

purchase after ten years. In their detailed provisions these ordinances were objectionable not only to the municipal ownership advocates but as well to many believers in the policy of franchise renewal. The companies evinced a disposition not to accept suggested amendments. Nevertheless, it was decided to have the Council in committee of the whole formulate its views for submission to the companies for final acceptance or rejection.

The "Gray Wolves". At this meeting af-

fairs took a very Peculiar Action peculiar turn. It is the boast of Chicago that it has an honest City Council, but there are remaining in that body of seventy members about a dozen Aldermen of the old-time gang type, commonly referred to as "gray wolves." It was this "gray wolf "contingent—that was believed to be looking without success for bribes to aid the franchise renewals—that turned the tide in favor of Mayor Dunne and his municipal ownership measures. One of these Aldermen moved the substitution of the Mayor's municipal ownership ordinances for the franchise-renewal ordinances. The motion prevailed by a vote of thirty-six to twenty-eight. Council thereupon rose from committee of the whole and passed the Mayor's ordinances forthwith. The sudden reversal in attitude of the "gray wolf" Aldermen had changed the Mayor's minority in the Council to a majority. While the radical municipal ownership advocates were greatly elated over the victory, there is in Chicago considerable disquietude over the sudden haste in dealing with this important subject and the procedure by which the victory was attained. There are those who think that the "gray wolves" acted in the interest of the traction companies, by proposing the least practicable plan for municipal ownership and the one least likely to be carried through with success. The proposed ordinances will be subjected to considerable litigation before results can be obtained under them. The entire certificate feature of the Mueller Law-which authorizes the issuing of certificates that shall be a lien only on the property, and

not be a debt of the city, subject to the constitutional limitation on municipal indebtedness-is admittedly experimental and of uncertain constitutionality. In addition, some critics of this ordinance claim that it is not drawn in conformity with the Mueller Law and is therefore illegal on its face even if the Mueller Law itself be constitutional. Many also contend that this particular ordinance was not the best of several plans proposed by Mayor Dunne for bringing about municipal ownership. While there is a disposition in many quarters to blame Mayor Dunne and his adherents for confusing an already tangled situation, there is another side to the matter. The private traction interests in Chicago, by their stubborn refusal to deal fairly with the city, have done more than any other agency possibly could do to fan the flames of radicalism. The conservative elements generally, both in the City Council and in the community, instead of recognizing that municipal ownership must inevitably come sooner or later and taking the leadership of that movement and trying to direct it aright, have tried to thwart the well-known will of the majority of the people as expressed on several occasions.

•

Unheralded to the The Imperial public, though di-Chinese Commission rectly accredited by the Emperor of China to the President of the United States, the Imperial Chinese Commission have surprised the country by their quiet arrival. The dignity of the Commissioners and the great importance of their mission were recognized in advance by our Government, which not only sent orders to its officers at San Francisco and Chicago to offer the Commission every attention and facility, but sent Professor Jeremiah W. Jenks, of Cornell University, as its special representative to meet them and conduct them to Washington. The Mayor of *Chicago announced their coming to the city by arrangements for their civic reception and itinerary befitting the high rank and purpose of the Commissioners. The two Viceroys were attended by twenty high-class officials and educators, some

of whom won their degrees in the universities of this country and Europe. At the head of the Commission is Tuan-Fang, the Chinese hero of the Boxer rebellion, whose independent and courageous disobedience of the Imperial edict to kill all foreigners of his province of Shensi, strangely enough, led to his subsequent promotion to be the Governor of two provinces with thirty millions of inhabitants. He is one of the few progressive leaders who are initiating and furthering the amazing movement for constitutional government in China. prepare the way for it two commissions have been sent to study the constitutions and institutions of the representative governments in America and Europe. one now here goes to Germany, Belgium, Russia, and Italy. Another, under Prince Tsai-Chen, follows to England, France, Holland, and Switzerland. The impressions received and given again by the Commissioners at Chicago indicate the momentous importance of this new movement of China, and the spirit of the men who are carrying it on and out. The commercial value of their visit to such great industries as our packinghouses, harvester works, and steel plants is obvious. But the significance of their incisive insight into our charitable, reformatory, educational, and social agencies appeals to the higher hope for human progress in China. When, after their three crowded days of observation. they were asked what most impressed them in Chicago, the reply of the Viceroy, Tuan-Fang, was most hopefully significant: "Public care of the insane, the house where the lady was [meaning Miss Adams, at Hull House, and the Young Men's Christian Association building.' Their wise and courteous silence regarding our unjust personal discrimination against their whole race, which men of such caliber and culture must deeply resent, only emphasizes the National necessity of the belated turn which American sentiment is taking toward a more just and generous attitude in our relations to the Chinese. Our reversion to the higher type of American ideals is coming not a day too soon, if the people of the United States are to exert the influence upon the commercial, educational, social, political, not to say religious, progress of China which its people and the world have the right to expect of us.

"The Father-in-Law of Europe"

On Monday afternoon of this week Christian IX., King

of Denmark, died. He passed away suddenly, but quietly, surrounded by his children and grandchildren. There had been so little indication of his approaching end that on Monday morning he gave long audiences, lasting three hours. Christian IX. was born in 1818. was a prince of the house of Schleswig-Holstein-Sonderburg-Glücksburg. At an early age he married Princess Louise, the daughter of the Landgrave of Hesse-For many years there seemed little prospect that the young prince would ever become King of Denmark; but finally, in 1852, as the reigning King, Frederic VII., was childless, the Danish succession became an object of some anxiety to the European powers. A meeting of plenipotentiaries was held in London to discuss the matter, and concluded that, as Princess Louise was the nearest heir, her husband should be A Danish law thereupon the next King. declared him heir to the throne. most important event of the King's reign was when Holstein and a part of Schleswig were claimed by Germany. German force occupied those territories. The King hoped for help from Great Britain, but, receiving none, was obliged to come to terms with the conqueror. Those were disastrous days for Denmark, but the King did not allow himself to be overborne by circumstance. granted a new Constitution in 1866, put his army and navy upon a new foundation, promoted the construction of railways, and did all in his power to stimulate agriculture and commerce. was no easy task, since the Danes long carried their resentment at the outcome of the war to the absurd length of holding their monarch in some degree responsible. That the King was able to become popular, despite all this, showed his admirable temper of mind and resoluteness of purpose. Moreover, his exemplary domestic life endeared him increasingly to his people. of those who have visited Copenhagen have seen the King, generally accom-. panied by one of his sons, but otherwise quite unattended, walking in the Tivoli Gardens or in some other popular promenade, the recipient of spontaneous and affectionate attention from all his subjects. The King and Queen enjoyed such a long and unclouded term of domestic felicity as is rare in the history of crowned heads. In 1892 they celebrated their golden wedding; six years later the Queen died. As is fitting, their children have come to constitute perhaps the most remarkable of all royal families. The Crown of Denmark now worthily descends upon their eldest son; their second son well fills his difficult position as King of Greece; their eldest daughter, Alexandra, is the deservedly popular Oueen of England; their second daughter has exercised great influence as Empress and now ex-Empress of Russia; their third daughter is the wife of the Duke of Cumberland, the heir to the throne of Hanover, set aside by the German Emperor. The eldest son of the new King of Denmark is, of course, Crown Prince, and his brother has just become King of Norway. All these and the other children and grandchildren of Christian IX, have become closely connected by marriage with many royal and semi-royal families of Europe. But in the ultimate analysis the King's claim upon Europe rested not so much upon these family connections as upon his own character. His was perhaps the most honored figure in the group of European monarchs.

❸

Last week attention was directed to a country about which little has been heard of late. It was with surprise that one read last week of a revolution at Teheran, the capital of Persia, involving the surrender of the Shah, the Persian ruler, to the demand for a national assembly. The surprise was the greater when it was learned that the revolutionists numbered only a thousand, and were mainly composed of Mullâs, the peculiarly popular and democratic Mohammedan priests—for any person

capable of reading the Koran and interpreting its laws may act as a priest of this order. As soon, however, as such a priest becomes known for his peculiarly just interpretation of the divine law and for his knowledge of traditions and articles of faith, he is called a Mujtahid, or Chief Priest. Now, while there are many Mujtahids in Persia, sometimes several in one town, there are only four or five whose decisions are accepted as final. It is supposed, therefore, that among the revolutionists there must have been one or more out of the four or five priests of supreme influence. Perhaps no priesthood is more powerful than the Ulema, or Persian. It is fiercely national. It has steadily worked against progress coming from Europe. It is far more powerful over the people than is the authority of the Shah, as is instanced in the event of last week, and as is shown by the action of the Persian army, which has now refused to act against the revolutionists. A principal reason for this religious influence as distinguished from the Shah's is the fact that the Persian monarch and his Government have no voice in the matter of appointing the Mujtahids. Perhaps the Mujtahids and the Mullas have been acting against some infringement of their own privileges; at all events, their hatred of everything foreign has lately been accentuated by the joint demonstration of the Powers against Turkey, the troubles in connection with Morocco, and the Russian operations against the Mohammedan tribes in the Caucasus.

⊕

By far the most impor-Russian tant event during the Political Parties past week in Russia was the decision reached by the convention of the Constitutional Russian Democratic party declaring Russia to be a constitutional parliamentary monarchy. The fact that there are many avowed republicans in this party made this decision momentous, not only for the preservation of some kind of monarchy in Russia, but, in view of the loyalty of soldiers and peasants, for the preservation of the present dynasty. A majority in the convention concurred in acknowledging that to persist in demanding a republic would lead

to military rule, a dictatorship, and a long postponement of coveted reforms. The part of wisdom, therefore, was to discard political theories wherever they came in conflict with practical wisdom; in other words, the Constitutional Democrats voted to make the most of what they could get. This decision puts their party on practically the same plane as that occupied by the Constitutional Monarchists and by other wings of the great Liberal party, and the Witte Ministry is strengthened as it has not been since its accession to power. Broad-minded as the Prime Minister's ideas may be, however, they are in apparent conflict with those actually carried out by his Minister of the Interior, Durnovo, who has now exhausted the present accommodations in all the great centers of population, and has made demands upon the Government barracks, railway and customs sheds, to shelter his political police. Furthermore, it is charged that a very large majority of the arrests are made solely on the grounds of political propagandizing and not because of any part taken in the bomb campaign, the detentions coming under a section of the old code which makes it a criminal offense to participate in any movement for a change in the form of government. It is further charged by the sympathizers with those under arrest that many have been in iail for months without indictment and These things have led to the suspicion among the laboring classes that the Durnovo mode of securing an acceptable Duma, or Parliament, is to put the men whom Radicals and Socialists would select in jail until after the election. Persistence in carrying out the methods of such an apparently reactionary Minister as Durnovo, under a Liberal Premier like Count Witte, would make the Duma a term of derision among the laboring classes and destroy the last vestige of confidence in the Czar's sincerity.

(P)

The United States at Algeciras, Spain, the International Conference "marked time" in providing a solution of the first question before it—

that of contraband. As was anticipated, France, with hundreds of thousands of French citizens across the border in Algeria, and Spain, which lies across the Strait of Gibraltar and has a little concession-settlement in Morocco proper, have received special rights and privileges in the maintenance of tranquillity on their respective borders. The consideration of economic and financial reforms in Morocco has now begun, and leads directly to the disputed points between France and Germany; and it is pleasant to read that our ambassadors at Algeciras are making the weight of America felt in quiet endeavors to bring France and Germany closer together. The reasons for the presence of our representatives at Algeciras were very clearly stated last week in Congress by Senator Spooner. He showed that there is no lack of precedent for the appointment of American delegates to a Moroccan conference. When we were colonies of Great Britain, she protected our commerce in the Mediterranean; when we were thrown on our own resources, the Barbary pirates destroyed and annihilated our trade, and we appealed to France for protection; France declined to grant this, but offered to use her good offices; in 1787 we made a treaty with Morocco protecting our commercial interests, and another in 1836, and still another, the existing treaty, in 1880. The assertion that we must not enter into a conference called for commercial purposes, but into which political questions may enter, the Senator from Wisconsin declared, is an intimation that we are afraid to enter into a conference as the peer of the other nations. Are we to confess that we dare not send delegates to international conferences to protect American interests for fear that they will not know when to withdraw? With Senator Spooner, most Americans, we think, believe that the President of the United States, who hit upon the psychological moment to intervene and bring to an end the deplorable war between Russia and Japan, can be trusted to determine the psychological moment when our ambassadors must withdraw from the Moroccan Conference in order to save

this country from all danger of unfortunate European entanglement, should such a moment come to pass. Finally, Mr. Spooner announced what is generally not known, that two of the Great Powers had declined to be represented at Algeciras unless all the signatories to the existing Moroccan treaty took part, the inference being that if America had not accepted the invitation to participate in the Conference there might have been no conference at all, only an increase of difficulty in an unfortunate but remediable international situation.

€

In the history of so young an Mozart art as music a hundred and fifty years mark a long period. It was but a little over a hundred and fifty years ago that Bach died, and just a hundred and fifty years ago last Saturday that Mozart was born. Since that time the art of music has developed as no other fine art has ever done in such an interval. The most daring innovations of those days seem almost as archaic as Egyptian sculpture; and the musical commonplaces of to-day would seem to the men of that day meaningless cacophony. In spite of Beethoven and Schumann and Brahms and Tschaïkowsky, symphonies and quartettes of Mozart are alive and vigorous; in spite of Weber and Verdi and Wagner, operas by Mozart are not only far from obsolete -they are immensely popular. Mozar.'s music, fresh, happy, vigorous, and beautifully organized, does not, it is true, rouse the emotions of present-day audiences as it once did; yet it is noteworthy that so emotional, tragical, despairing a nature as Tschaïkowsky found in Mozart's music that which enthralled him as the music of no other composer did. The sesqui-centennial of Mozart's birth was celebrated in all parts of the world. In Germany it was marked by Mozart programmes and performances of Mozart operas; but Mozart's genius is universal and holds its sway over many lands. In the United States concert and opera programmes last week almost everywhere bore Mozart's name. In Boston Mr. Gericke contrasted Mozart with the modern Russian Glazounoff: in New

York many concerts were devoted to his memory, not least that of the Russian Symphony Orchestra, under the direction of Mr. Modest Altschuler, which departed from its custom by admitting a non-Russian composition to its programme, contrasting Mozart with Tschaikowsky; and in Chicago, where the Thomas Orchestra, of which Mr. Stock is conductor, performed a concert half of which consisted of Mozart compositions, and the other half contained Tschaikowsky's "Mozartiana" suite. We cannot always live in the shadows, even if they allure by their mystery and their suggestion of romance and deep experience; we need also the light, and in Mozart we have it with full radiance.

@

General Wheeler Few Americans were held in greater personal regard than General Joseph Wheeler, who died in Brooklyn on Thursday of last week in his seventieth year. had fought in two wars, and in both he had distinguished himself by gallantry. At the close of the Civil War, although he was only twenty-nine years of age, he was a Lieutenant-General and the senior cavalry officer in the Confederate service. After the full interval of a generation he led the United States cavalry as Major-General of Volunteers in the campaign in Cuba. In serving under the flag against which he had once fought he was only carrying out the spirit of the greatest of the Confederate leaders, and interpreting at the end of a generation the attitude which General Lee had taken in recognizing the logic of events and loyally co-operating with new conditions. In two or three places in the South General Wheeler was condemned for accepting service in the United States army, but he lived to put his critics in the wrong. Nothing has done more to bind the North and the South together than a common service under one flag against a common enemy in the war with Spain. General Wheeler had long been regarded in the North as a type of the gallant Southerner; his dash and brilliant activity in the Cuban war made him a popular hero, and as much probably as any Southern man of his time he has brought into cordial relations with the Government that influential class in the South who once served in arms against it. The Confederacy had no braver soldier or more faithful servant, nor has the South had a truer friend and a wiser counselor than General Wheeler proved to be in the later years of his life. was not a great commander like Lee, but he was a brilliant and resourceful cavalry leader, of fiery energy and inspiring gallantry. He was one of the men who made the country aware that the days of sectionalism were ended. soldier by education and profession, he became later a lawyer and a cottonplanter; he had considerable experience in politics, and was twice elected to the House of Representatives. He was also an industrious writer, the author of a number of historical books, of a series of monographs, and of many articles in magazines. He was heard on many public occasions, especially at dinners, and was always received with a welcome which evinced the warmest admiration for his personality as well as for his distinguished record. He had become a National figure, and will be greatly missed: he was the last survivor of the conspicuous leaders in the Civil War, and his going marks the end of an era.

(2)

At the meeting of the Arm-Fisk and strong Association in New Tuskegee York last week Dr. Booker T. Washington stated in a single sentence the problem for which the solution is sought through negro education: "Since we are to forever constitute a part of the citizenship of this country," said he, "there is but one question to be answered: Shall we be among the best citizens, or among the worst?" There are, as a matter of fact, very few people, North or South, who would deliberately prefer to keep the negroes among the degraded classes; but there are a great many who think that education has done little to elevate them. For that reason it is not without significance that, in spite of indifference, such institutions as Hampton, Fisk, and Tuskegee are continually growing, not only in material prosperity, but in educational efficiency.

This year marks the fortieth anniversary of Fisk University. It was celebrated at Nashville by exercises lasting for three days. Fisk has contributed very largely to the supply of colored teachers, as well as to the number of negroes in medicine, law, and the ministry, and has therefore performed a very great service. It has undertaken, as The Outlook has reported, an enlargement of its function by adding a department of applied science, thus recognizing more than ever before the value of practical knowledge in education. At the celebration it was announced that money had been pledged for the new building required, and that the alumni were cooperating in the attempt to raise an endowment. In New York last week the Armstrong Association recognized the twenty-fifth anniversary of Tuskegee Institute. At the meeting Mr. Joseph H. Choate, Mr. Samuel L. Clemens, whom everybody knows as Mark Twain, and Mr. Robert C. Ogden, besides Dr. Washington himself, addressed a crowded audience. The celebration at Tuskegee itself will take place in April and will consist of an exhibition of its history, of the work of its students and graduates. of its extension work, of negro music, and of the progress of the negro in general, and will include addresses by prominent men of both races. Tuskegee needs \$1,800,000 for its endowment, and it is hoped that this amount may be raised this year. The white people of the South have sturdily withstood all attempts to break down the public education of the negroes and have borne their burden strongly. There is, therefore, a special obligation upon the people of the North to give to such institutions as Hampton, Fisk, and Tuskegee a hearty financial support. The task is the Nation's task, and the Nation ought, and we believe will, perform it.

æ

Indian
Church Schools:
the Way Out

Church Schools:
the Way Out

As our readers will remember, all Congressional appropriations for Indian schools under ecclesiastical control were discontinued by Congressional act, by a series of diminishing appropriations, and in accordance with a policy settled and

announced some years ago. Notwithstanding this, the practice grew up in the Department of allowing, under restrictions, the appropriation of certain trust funds under the control of the Department to church schools upon the request of the Indians. After consideration, the President ordered this practice continued until it was negatived either by the courts or by act of Congress. His recognition of the fact that it might be negatived by the courts was tantamount to an acknowledgment that the legality of such an appropriation was doubted, and in point of fact this was the case. In his last report the Commissioner of Indian Affairs prescribed very careful regulations to prevent the perpetration of frauds upon the Indians in the endeavor of church representatives to secure the consent of Indians to the use of their moneys in church schools. these regulations being provided in compliance with the President's direction that "care must be taken, of course, to see that any petition by the Indians is genuine, and that the money appropriated for any given school represents only the pro rata proportion to which the Indians making a petition are entitled." It is our opinion that any one reading these regulations would find an additional and weighty argument against the policy which the President is pursuing in this matter in the very fact that it is necessary to make such an elaborate provision to prevent fraud. We do not need here to repeat the more fundamental reasons which we have given to our readers from time to time against that policy; it is enough to say that the true way out is indicated by two bills now before Congress. The first is the Stephens bill, which explicitly provides that no trust funds shall be used for purposes of education in any sectarian or denominational schools. This bill is simply an extension of the principle that Congress has already adopted, and may almost be said to have been suggested by the President's phrase that the practice of giving such appropriations "will be continued unless the Congress should decree to the contrary." The other measure is the Lacey bill, which authorizes the President in his discretion from time to time to designate

such Indian tribes as he may deem to be sufficiently advanced in civilization to be prepared to manage their own money, and shall thereupon cause the money held in trust for such tribes to be allotted in severalty to the members thereof. These two bills, supplementing each other, would take this troublesome question out of politics. There is very good reason why the United States Government should not, directly or indirectly, make, for the benefit of church schools, any appropriations out of any funds, however they may be held; but there is no reason why Indians who are sufficiently intelligent to determine how their money should be spent should not have their money given to them and be left to spend it in their own discretion. uously as The Outlook is opposed to any connection between the Government and the church schools, it is inclined to advise Indians, where they can do so, to send children to schools of their own religious faith, and to pay for the tuition out of their own funds.

₩

At last some one has Punishment for the been punished for Slocum Disaster the disaster to the excursion steamer General Slocum which brought death to a thousand people more than a year and a half ago. The captain of that craft has been adjudged guilty of criminal neglect in not providing effective fire drills for his crew, and has been sentenced to ten years in State's prison. He is sixty-eight years of age; his punishment is practically life imprisonment; he will appeal; but he is convicted and sentenced. At the time of the wreck he displayed courage and fidelity; but then it was too late. His punishment ought not to be considered as the less deserved because others have taken the risks he took and have escaped the consequences. Rather his punishment ought to be regarded as an example of what in justice ought to be the fate of every man who, like him, has recklessly put in peril the lives of helpless human beings on the water. If the captain deserves such chastising, what ought to be required of those officers of the company which owned the steamer for permitting such an inflammable vessel to be ill protected and for supplying it, not only with an inadequate number of life-preservers, but with so-called life-preservers which were actually weights dragging their victims more surely to death? Some of these officers have been indicted. The warning has now been given to the captains of excursion steamers; let it be no less clearly sounded in the ears of their owners and managers.

In characteristic fashion Football Reform the West has undertaken in the West the reform of football by proposing constructive measures in a radical spirit. Representatives of nine Western universities—the "Big Nine" they are called in athletic circles-met last week in conference. This is the roll of honor: Chicago, Illinois, Indiana, Iowa, Michigan, Minnesota, Northwestern, Purdue, Wisconsin. The radical spirit of this conference was shown in passing among its resolutions the following article: "That the game of football, as played at present, is hereby abolished as an intercollegiate and collegiate contest in the conference colleges." itself that resolution would have put those universities in the same category with Columbia and Harvard. That resolution, however, was very far from being by itself. It was incidental to one of eleven resolutions making positive and practical recommendations which will go into effect as soon as they are ratified by the respective universities. The conference describes at length the evils of present-day American football. These it divides into two classes: those inherent in the present rules, and those attendant upon "the general raising of the game into a thing of absorbing and sometimes hysterical public and collegiate interest." These latter in particular it describes as extravagance, multiplicity of games, unreal ideals (engendering intercollegiate bitterness, suspicion, and trickery), professional coaching independent of faculty control (which accounts for the pressure put upon teams to win at all hazards), and false loyalty of alumni exhibited in money contributions and in recruiting of students for the sake of athletic prestige. The conference therefore recommends that intercollegiate contests be greatly reduced in number, limited to the three upper classes of undergraduates, and confined to varsity teams, that the football season be shortened, that admission fees be reduced. that training tables and preliminary training be discontinued, and eligibility be more clearly defined. As to the rules of the game, the conference awaits the conclusions of the Rules Committee recently organized; but in default of sufficient modifications from that source, it recommends that the conference itself appoint a committee to draw up rules of Most important of all, the conference declares that the faculty shall control the conduct of football, both in the matter of coaching (thus establishing the ethical standards of play) and in the matter of financial management (thus establishing the ethical standards of athletic support). The resolutions on this particular subject are as follows:

That hereafter there shall be no coaching except by regularly employed members of the instructional staff, approved by the trustees of the university on recommendation of the faculty; and that the salary attached to the position shall be no greater than that paid to other members of the faculty of similar rank.

That the conference colleges take steps to reduce the receipts and expenditures. That the athletic surplus be devoted, as far as possible, to permanent university improvement. That the financial management of athletics be entirely in the control of the faculty, who shall publish all reports of receipts and expenditures.

It is also stated on the authority of Professor Albion W. Small, of the University of Chicago, that it was understood that hereafter the schedule of games should be so arranged as to do away with a contest for championship. These admirable recommendations will, it is expected, be approved. In that case the abolition of football, or its suspension for two years, as suggested by the conference, would not be operative. The colleges and universities of the East, hampered by a spirit of conservative individualism, ought not only to take courage, but also to derive instruction, from this Western conference.

Preying on the Rich

The acquittal of Mr. Norman Hapgood, the editor of "Collier's Weekly," in the proceedings for criminal libel brought against him on the complaint of Justice Deuel, is a practical conviction of Justice Deuel and "Town Topics" upon the charge that Justice Deuel was "part owner and editor of a publication which disseminated scandals about people who were not cowardly enough to pay for silence." For Mr. Hapgood, the editor, and Mr. Collier, the publisher, assumed full responsibility for this charge, and Mr. Hapgood was acquitted by the jury, after only seven minutes' deliberation, on the ground that the charge was fully proved by the evidence. With this verdict the public agree. The only acceptable course for Justice Deuel is to retire from the bench, and for Colonel Mann is to retire "Town Topics" from publication. That either will do so is not at this writing indicated.

The follies of the silly rich and the cowardice of the criminal rich have long been a theme for satirists; but neither have ever been more effectively exposed than in this trial. And the probabilities are that the exposures are not yet ended, for Colonel Mann, the publisher of "Town Topics," has been arrested on a charge of perjury, and there are intimations that other prosecutions growing out of this publication are to follow. The evidence already before the public has proved that "Town Topics" has depended for its profits, if not for its existence, upon trading on the fears of a few society people in whose lives there have been incidents which they do not desire the public to know, on the apprehensions of some timid people who dreaded lest their names should appear in this disreputable sheet, and on the ignorance of some silly people who imagined that it was a society paper in whose columns it was a social advantage to appear. The criminal and the timid rich paid for silence; the ignorant and silly rich for self-advertisement. Hereafter the words of "Town Topics" will be neither an object of dread to the first nor of desire to the second.

So long as a certain group of people

in so-called society have no other object in life than amusing themselves by inanities, vulgarities, and occasional immoralities, the basis for the prosperity of such journals as "Town Topics" will exist. But the criminal rich, the timid rich, and the silly rich constitute a very small proportion of the entire rich. These people do not in any sense constitute real society; for society in any true sense of the term is the companionship of men and women of wide interests and intelligence. The kind of society with which "Town Topics" has dealt has been mainly the companionship of men and women without education, culture, taste, or character. This group does not represent New York society as a whole; it is only a section of that society. Nor as a section is it confined to New York; it is found in every city of any size in the world; and, if the reports of well-informed people are to be believed, it presents more obnoxious features in some smaller cities than in the metropolis. Such a Yournal as "Town Topics" lives and thrives because supposedly decent men and women are willing to buy and read it. Hereafter the people who buy and read it will not be supposedly decent.

The commendation and gratitude of the public are due to both the editor and the publisher of "Collier's Weekly" for the courageous service which they have rendered to the public.

The English Elections

The membership of the new British Parliament is now substantially made up. and the result is one of the most sweeping victories which any political party has ever secured in Great Britain. The Liberals will have as great a number of men on the benches of the new House as any party has ever succeeded in seating in Westminster Hall. For three years the Liberal leaders have been declaring that the country was steadily coming their way; for the past year men like Mr. Morley and Mr. Bryce, who do not speak except upon mature consideration, have declared that the coming election would return the Liberals to power; but the most optimistic Liberal has not dreamed of so overwhelming a victory, nor has the most pessimistic Conservative imagined so disastrous a defeat. All the members of the Liberal Ministry were seated without the least difficulty, while seven members of the recent Unionist Ministry were defeated, including Mr. Balfour, who will get into the new House of Commons by the courtesy of a Conservative who has resigned a seat in London in order to provide for it. Alone among the leaders of the defeated party Mr. Chamberlain will carry into the new House something of his old prestige. The seven members elected from Birmingham, whom he will head, represent the little group around the leader who were not overborne and swept out of existence by the tremendous tide of Liberalism.

It is too early to interpret the full significance of this sweeping Liberal victory, but there are indications that it is not only a great party success, but that some of its results are likely to be revolutionary. England stands pledged. for the time being at least, to freedom The great principle for which she has stood as a leader she has refused by an overwhelming majority to abandon. Every attempt to put into the back ground the issue which Mr. Chamberlain raised and for which he fought with characteristic courage and audacity, the issue which Mr. Balfour evaded—now to reap the usual fruits of evasion—has disastrously failed. The British voters refused to be misled by the various attempts to divert their attention from the fundamental issue by pushing other issues, like Home Rule, to the fore. was pointed out in these columns several weeks ago, Canada has refused to accept Mr. Chamberlain's protection policy, and now the people of Great Britain, after a long series of local expressions of opinion through by-elections, have answered with a tremendous "no" his proposal to change British commercial policy.

Other elements, of course, contributed to this sweeping decision. The cry of Chinese slavery in the Transvaal has aroused for months past the bitterest antagonism among the Liberals and elicited indignant opposition from many Conservatives as well. What the Con-

servatives in the days of Gladstone used to call derisively the Nonconformist conscience, one of the most valuable political as well as moral assets of Great Britain, has been aroused by the Conservative policy towards coolie labor in South Africa, and that policy has been repudiated as marking a departure from fundamental British principles. educational legislation of the Unionists has called out widespread protest against what Nonconformists of all kinds regard as gross injustice. It must be remembered, moreover, that for two or three years past the lassitude and uncertainty of Mr. Balfour's leadership have been increasingly disappointing to the country. The English love above everything else a clear and definite position; they resent any kind of sophistication; they dislike fine distinctions in politics; they insist upon sharp definition of issues. These were precisely the qualities which Mr. Balfour lacked. man of greater personal charm, except Lord Rosebery, or of more thoroughly trained mind, has ever been at the head of the English Government than Mr. Balfour, but his failure to meet the issue which Mr. Chamberlain raised fairly and squarely broke his political influence. His skill in dialectics and the great personal regard felt for him made him an adroit and generally successful leader on the floor of the House of Commons: but his lack of decision has fatally handicapped him as a leader in the country at large. British voters have grown weary of the lack of decisive and clear leadership in the Conservative To his courage and the definiteness with which he has stated his position Mr. Chamberlain probably owes his re-election by an increased majority from Birmingham.

The revolutionary aspect of the election is brought out by the sweeping change in the personnel of the membership. More than half the men who will sit on the benches of the new House of Commons will be strangers to its customs and habits. The "Daily Mail," commenting editorially on this fact, describes the election as "the revolution of 1906," and declares that what has been called the first club in Europe has gone,

and expresses the hope that the first business house in Europe may take its place. The workingmen, represented in the last House by six members, will be represented in the new House by a solid body of more than fifty. Not since Simon de Montfort summoned the nobles. clergy, and commoners to sit together in the English Parliament, in the reign of King John in 1265, has a more significant change been wrought in the constitution of that historical body. The advent of the workingman marks the latest stage in one of the most notable evolutions in the political history of the world, and practically completes the representation of the English people of all classes in its great representative body. Ten years ago fifty thousand labor votes, representing all shades of opinion from conservative trades-unionism treme Socialism, were cast without returning any members to the House of Commons; this year more than half a million votes were cast, with the result of returning a body of representatives sufficiently large and important to command a hearing and to count as a factor in the legislative history of the day. It must not beforgotten that no small contribution to this result was made by the Irish vote throughout Great Britain, which in many districts was cast solidly for the Labor candidates under the direction of the United Irish League, which recommended, as reported in these columns at the time, that in all cases where a labor candidate who was sound on the question of Home Rule was in the field, the Irish vote should be cast for him, unless he stood against an old and tried friend of the Irish cause. It is impossible to predict the immediate results on legislation of this immense increase of the representation of the working class; but no one in England questions that it will be very great, and that a new epoch in the Parliamentary history of the country has begun. One of the results in the near future will probably be the granting of some degree of Home Rule to Ireland; for, as a class, the labor men are very sympathetic with the movement to remove restrictions from Ireland, and to give that country greater political and economic liberty. The Liberal triumph

promises to be of far greater significance than an ordinary political party victory.

Shall We Legalize Homicide?

Now that the proposal to legalize the killing of men who are adjudged to be hopelessly ill, and thus put them out of a suffering difficult to endure and sometimes more difficult to witness, has been thought worthy of serious consideration by the Legislature of Ohio, it calls for serious consideration by public journals. The fact that a bill to legalize homicide has been introduced into the Legislature indicates nothing, for apparently legislative etiquette requires the legislator to offer to the body of which he is a member any measure, whatever its character, which any of his constituents submit to him. The fact that this bill has been referred to a committee for consideration by a vote of 78 to 22 indicates very little. For aught the public now knows, every member who voted for such reference did so because he believed the surest method of putting an end for all time to this proposal was to have it given careful consideration. But the fact that it has been so referred makes it wise, if not necessary, to state the objections which to most rational thinkers appear conclusive against this proposal to make homicide lawful.

The objections are not merely the practical ones which occur to any thoughtful man on the first consideration of the subject: that it would open the way for cunning, unscrupulous greed to commit murder which would be very difficult to discover, and for which discovery and punishment would furnish no remedy; that it would tempt some guardians of the sick to rid themselves of their burden, sometimes by deceiving themselves, sometimes by deliberate deception of others; that the sentimentalists who could not endure the sight of suffering would be incited to relieve themselves of the heartbreaking sight by accelerating the death of a sufferer whom a wiser, stronger, and less selfish love might recover to life; that it would in

innumerable cases add to the terrors of the sick-bed by stimulating fears that would be natural even when they were wholly groundless; that it would make the patient often look forward to the visit of the physician with dread instead of with hope, and, by authorizing the doctor to decree the death of his patient, would greatly enhance the difficulty of curing him; that it would make it easy for quacks and charlatans to conceal their failures by contriving to put their patient out of his misery by putting him out of life; that it would ask physicians to exercise a judgment which very few right-minded physicians would be willing to exercise, and would put upon them a responsibility which only the unscrupulous, the light-minded, and the incompetent would be willing to assume. No provisions of the law, however carefully framed, no professional education, however ideal, could adequately guard against these dangers. But were it otherwise, more serious objections remain.

If a law authorizing homicide in order to lessen human suffering were passed, we do not doubt that it would be pronounced unconstitutional by the first court which was called upon to adjudicate upon it. Government in America possesses only delegated powers: and power to kill, except as a punishment for crime, has never been delegated to the government of either the State or the Nation. The Constitution assumes that the right to life, as the right to liberty, is, in the language of the Declaration of Independence, "unalienable." No doubt slaves were often more comfortable in slavery than in freedom; but no man can by any deed contract himself into slavery. As little can he consent to his own death. This unalienable right is assumed as fundamental in that article of the Constitution which declares that "the right of the people to be secure in their persons . . . shall not be violated;" and in that other article which, providing that no person shall be twice put in jeopardy of life or limb for the same offense, carries the necessary implication that he cannot by anyact of government be put once in jeopardy when he has committed no offense.

But a law legalizing homicide would not only violate the provisions of the United States Constitution, it would be subversive of the very foundations of government. Government is based on the right of man to use whatever force is necessary to protect his own person and' property, and the person and property of his neighbor, from wrongdoers. To use for the purposes of destruction that power which was given only for the purposes of protection is to overthrow government and loosen all the bonds of loyalty. If a government will not or cannot protect the lives of its citizens, it is no longer entitled to their allegiance. It is true that government sometimes destroys property, as when it blows up a building in order to check the progress of a great fire. But in this case it destroys some property in order to preserve much more property. It is true that the State sometimes puts the murderer to death. But the only justification for capital punishment is that it is necessary to destroy the life of one guilty man in order to make safe the lives of many innocent men. But for government to destroy life in order to lessen suffering is for it to violate the very principle which gives it the right to exist. Man has a right to destroy life to protect other lives. he has no right to destroy life to prevent suffering. The issues of life and death are not in his hands. They are in the hands of One wiser, stronger, more tender than himself. The law of the ancient Table is but the echo of the universal conscience: Thou shalt not kill. To legalize homicide is to make the State an organized offender against the law of God.

We do not see how any Christian can entertain a doubt upon this subject; if he does, a brief reflection upon his Master's example should suffice to dispel it. If ever anticipation of terrible suffering could justify escape from it by suicide, it would have been justified in Christ's case. He looked forward with certain prevision to those hours of prolonged torture upon the cross. He knew that the sword would pierce through his own mother's heart also. But he faced the anguish with calm resolve. "The cup that my Father giveth me, shall I not drink of it?" he said. And by that consummation of his Passion he did not less for the world of men than by all his teaching. Suffering is the world's medicine. To alleviate it, lessen it, succor the suffering from it, is divine. But to flee from it before God's time by suicide is always cowardly; to destroy the sufferer's life before God's time would be murder.

A Great Lay Order

Comparatively few people in this country are aware of the magnitude and importance of the religious forces directed by the Young Men's Christian Associa-They do not know, unless they happen to have relations with these Associations, the vitality of their methods. the increasing skill with which they are using their instruments, and the great and growing need of their work. The Outlook prints this week the third of a series of studies on the organization, present condition, and prospects of the Association in the United States. though not wholly free from criticism, these articles are in the main a record of remarkable advance as regards the underlying idea, method of work, and conception of opportunity. The writer does not exaggerate when he characterizes the Association as a modern lav order, closely related in spirit and by definite attitude to organized Christianity in all its forms. The Association has an independent existence and is doing work outside the churches of an importance and a magnitude quite as great as that done by many of the churches to which it ministers. It long ago allayed the fears of those who dreaded it as a possible rival of the Church, for it has revealed itself everywhere as a feeder of the Church. But what the Church cannot do in many communities the Young Men's Christian Association does; it is able to lay its hand on hosts of men who will not enter the church doors, and, having brought them within the reach of its influence. it ultimately sends them inside the churches. It has rendered a real service to the Church by broadening its conception of the religious man and of religious interests. The great attention which it has given to physical develop-

ment represents one of its best services, not only to young men but to the Church, and has gone a long way towards destroying the last vestige of the atheistic and divisive mediæval conception of the antagonism between the body and the soul—a warfare to be terminated, not by the humiliation of the body, but by bringing it into subjection to the spirit and making it the instrument of a richer and fuller life. If the early Renaissance was the rediscovery of man and of nature, the later Renaissance has been the rediscovery of the body as the habitation of the soul, and its re-establishment in dignity and worth.

The Association has also allayed the fears of those who saw in it the danger of a pietistic, conventional, and unvirile type of religion, a coming together of men of good intentions but weak in native qualities and force, largely free from temptations because lacking in virility. Whatever ground there may have been for the criticism of the membership of the Young Men's Christian Association as "goody-goody" and anæmic has long ago disappeared from most Associations. Nor has the Association succumbed to the danger foreseen in its early career that its influence would tend too strongly to the seeking of material success, and that its standards would be purely commercial. has sometimes yielded to this influence is true; that in some Associations commercial ideals are too strongly urged and commercial success too constantly emphasized as the end of living is also true. There was no reason why the Young Men's Christian Association should not reflect to a certain extent the aims, opinions, movements, and interests of the country as a whole, and those aims and interests have been, and are likely to be for a long time to come, very definitely stamped by the commercial spirit. But the Association has been saved, as the writer of these articles has pointed out, by its embryonic response to the appeal of the pressing industrial and sociological problems of There are, and will continue the hour. to be, members of the Association whose only interest in it arises from the fact that they can learn in its night and

day schools to earn more money; but many members, under the guidance of the most progressive Secretaries, and the Associations as organizations, are taking up the task of interpreting religion in terms of practical service and of the brotherly spirit. The Association has still a long way to go, but so have the churches. It is of the utmost importance, however, that the men who direct the energies and activities of the Association should define more clearly to themselves and to others the higher ideals for which it stands; and while they endeavor to pave the way to success and to open the doors of opportunity to young men, they should make it their business to interpret success in spiritual terms, and to impress on the young men who come under their influence the highest ideals of unselfish living.

The work of the Young Men's Christian Association has now become so vast, its membership so large, its facilities and instruments so well ordered and so finely adapted to their ends, that it has assumed a great responsibility, and those who appreciate most deeply what it has done are most deeply concerned with the question what it can do in the future. Are the men who are responsible for the broad policy of the Association aware of the greatness of their opportunity? Do they realize fully what can be done with the tools in their hands? Do they understand the meaning of their access to the young men of the country. Are they taking a statesmanlike view of their duty and their prospects? These questions are not asked in the spirit of criticism, but from a deep appreciation of what has been done, and in the earnest hope that the Young Men's Christian Association may command and exert an influence in this direction which will utilize to the utmost an opportunity for religious and ethical training the like of which has perhaps never come in the way of any other lay body. Among all the forces which are to-day at work in American society to build the Nation soundly and solidly on immovable foundations, there is perhaps no force greater than that in the hands of the Young Men's Christian Association.

THE MOROCCAN QUESTION

BY PROFESSOR E. MONTET, D.D.

Dean of the Theological Faculty of the University of Geneva, Switzerland, author of "A Journey in Morocco," etc.

N International Conference of the Powers to settle the Moreccan Question is taking place at Algeciras. Will this Conference really solve the Moroccan problem? We may be permitted to doubt it. For one who is acquainted with the history of Morocco since its entrance into relations with the European Powers there can hardly exist any illusions on this subject. The policy of the Sultan of Fez has always been to play off against each other the interests and selfish ambitions of the Christian States, and in this way to neutralize their influence. It will in all likelihood be the same after the Convention of Algeciras.

When the German Emperor so brusquely intervened at Tangier, he wished to arrest the action of France in her Moroccan projects, and, it must be admitted, he has succeeded. But his political course, it must also be said, is a short-sighted one, and, what is more, it is a policy entirely to be condemned from the superior point of view of the interests of civilization, and from a humanitarian standpoint.

Whoever considers the matter from the latter point of view, which is the only true one, whatever may be going on at the present day in Morocco, will recognize that the deplorable state of things in that country can only be corrected by a single will; that is to say, by the intervention of a single European Power

The experience which the writer has acquired during a number of years past in Moroccan affairs, added to the knowledge which he has of that country as the result of an extended journey of study and exploration (1900–1901), qualifies him to posit certain facts as the basis of the affirmations which he ventures to make.

Morocco, which geographically is only a few hours from Europe, is in point of

civilization removed from it by many centuries, and in passing from France or Spain to this corner of Africa you pass from the twentieth century to the Middle Ages; this is said literally and without figure of speech.

There is not in Morocco any avenue of communication, any railway, any road, any telegraph line. The roads the most traveled (Tangier to Fez, Mazagan to Marrakech, etc.) are simple tracks, good in a flat country with firm ground, and detestable in the mountains or in marshy districts. Outside of these "grand roads" the traveler cuts across the fields and passes where it seems to him best. I have journeyed in the Atlas Mountains, trailing after me some fifteen pack animals bearing baggage, tents, and provisions, having as a guide only my compass and the tracks made by the feet of horses and mules which had previously passed that way. The sole bits of road worthy of the name which I encountered in Morocco, between Larache and Rabat in particular, were remains of Roman roads. In Morocco, a country notable for its numerous watercourses and many large rivers, there are few if any bridges. One may count perhaps half a dozen of them, of large size, in a country a third larger than France. These large bridges are of Roman origin or date from the Middle Ages. I had to cross two of them. One was on the route from Fedhala to Casablanca. It would have been more prudent, with the beasts of burden, to pass over by ford-The other was near ing the stream. Marrakèch (Morocco). The great holes in the roadbed of the bridge warned the traveler to proceed with the greatest caution.

Morocco is a country without administration. Outside the custom-houses which in the ports open to Europeans are actually under the control of France, the taxes are collected in an altogether

Digitized by Google

arbitrary fashion. When the Sultan is in need of money, he demands it of his Kaids, governors of provinces, cities, or districts; and the Kaids, bringing pressure to bear on their officials, exact from them double or treble the money needed. In December, 1900, passing through the great market of Souk et-telata, where more than three thousand Moroccans from all parts of southern Morocco were gathered to exchange their products, they came to me and inquired inquired of me, the European traveler newly arrived from the seacoast-if it were true that shortly the supervision and control of the Kaids would be superseded by that of European officials. The i. es seemed happy at the prospect of this change, which they believed imminent.

A country which has neither roads of communication nor a well-regulated administration is a country in which security is precarious. When I traveled in Morocco, the country was in the midst of peace. I was able to proceed from Tangier to Mogador along the coast, from Mazagan to Marrakèch, and to penetrate the great Atlas Mountains from Amizuriz to Dar-Ouled-Emplous, in the province of Haha, in comparative safety. I had nevertheless encountered real dangers, had been attacked once in the country of the Zaira, again at the bridge of Marrakech, and had traversed a province in rebellion against its Kaid. To-day it would be altogether impossible for me to make such a journey.

Morocco is a country in which the administration of justice recalls that of the Middle Ages; a justice expeditious but On arriving at Rabat I barbarous. was shown the spot where, some time previous, three thieves, taken in the act, had been punished. They had cut off a hand and a foot of each of these poor wretches, and left them on the spot without succor of any kind. Two were dead; the third had survived his horrible wounds. At Casablanca I saw a Moroccan both of whose ears had been cut off by a Kadi with his own sword and on the open street, for I know not what offense. And what shall I say of the blind man whose eyes had been put out, and of other mutilated witnesses to the justice of the Sultan? And then, finally, the prisons of Morocco! I camped at Mogador at the foot of the walls of the celebrated prison of that city. At the time of the revolt of Rehamna, in 1895-6, twelve hundred political prisoners were crowded together in this horrible place, fastened one to another in human clusters with heavy chains. These unfortunates were decimated by typhus, by filth unspeakable, and miseries of every kind. It was here that Raisouli was for political reasons chained to the wall for three years, and it was here that he nourished the hatred which he afterwards displayed against the Sultan Abd-el-Aziz in the affair Perdicaris. When I encamped at the foot of these gloomy walls, I heard during the night at regular intervals the cries of the jailers guarding the prisoners, and at times also the laments of these unfortunates, invoking Allah or imploring the grace of the Sultan.

Morocco, finally, is a country in which there is neither an army nor a police, in the European sense of those words, to make its authority respected. We have recently seen how the army has defended the Sultan since Bon-Hamana has begun his insurrection. The Sultan does not venture to come out of Fez; at some kilometers from the capital he would be kidnapped. If ever Morocco is invaded by the armies of a European Power, they will drive before them the regulars of the Sultan. The mountaineers only, of the independent tribes, will resist with tenacity and fierceness, and the Europeans will repeat the experience they had with the Kabyles at the time of the conquest of Algeria. I have attended maneuvers of Moroccan soldiers; they were most pitiful. I have even been present at military exercises conducted without arms. A European officer of artillery told me he had seen Moroccan cannoneers sighting their guns by removing the breech and making use of the barrel of the cannon as a telescope! At Tangier, at the time I stayed there, the artillerymen, deeming their pay insufficient, devoured the tallow which had been given them to grease their guns.

Such illustrations, drawn at hazard from various departments of the public life of the people of Morocco, will show what the state of affairs is in that country, and that everything there is yet to be created and done.

One of my best friends in Morocco, a Counselor of State of the Sultan Abd-el-Aziz, said to me recently that it was necessary to begin the era of reforms in that country by the creation of roads and railways, and by establishing a well-regulated administration and an impartial justice. He was right, but this simple programme implies an entire revolution.

Will a federation of Powers be capable of accomplishing these reforms? It does not seem so to me. The manner in which the concert of European Powers is checkmated by Turkey enables one to foresee a similar hold-up of Europe in Morocco.

In order to accomplish anything it needs a strong will, and a single one. The great colonies which the European States have founded in Africa and in Asia have prospered only when they were under the direction of a single power. The same thing has been true of countries under protectorates. Morocco ought to become a protected country, as is Tunis to-day. This rule is best adapted for the present to the Mussulman countries which fall under European domination. In these countries the great obstacle to European control is the religious question, or Islam. This

question can be solved only by leaving the nominal authority in the person of the Sultan, their religious head. Islam ought to be the holy ground which the Christian does not trench upon. The Mussulmans will consent to resign the government and administration of the country in temporal affairs on condition that their religious faith, their worship, their mosques, and all that belongs to their religion is treated with entire respect and not interfered with.

Does this mean that France or any other European Power can effect a peaceable occupation of Morocco? I should be glad to believe it, but I do not think so. An Arabic proverb tells us: "God has created men for war." The experience of mankind since its origin until now tends to confirm this utterance of the Arabian sage. This is to express the belief that to civilize Morocco will require some volleys of musketry and cannon. But what will this matter if justice, if good government, if personal security and all the benefits of civilization, follow in their train and are implanted there forever! Let us invoke, then, with all our might the hour in which Morocco shall pass under the protectorate of a single European Power. On that day, and on that day only, barbarism will cease to reign in that country, and a future will dawn for its unhappy inhabitants.

RADIANCE

BY STEPHEN VAN RENSSELAER TROWBRIDGE

The mighty master Michael Angelo,
While working with his chisel, oft was known
To place above his head a candle prone,
That every stroke should be within its glow,
That he across his art should never throw
The shadow of himself; but carve each stone
In free accord with promptings from the Throne
To his responsive genius here below.

So may Thy love above my forehead shine
That neither shadows of a weary mood
Nor dark reflections of a sorrowed mind
Shall mar the lives God wills me to refine.
But ever may Thy loving spirit brood
O'er all my daily toil for humankind.

A MODERN LAY ORDER'

BY ERNEST HAMLIN ABBOTT

HEN the man at the club discovers what the subject of this article is, he will probably turn over the pages to find something else to read. To him it suggests the dull, the colorless, the vapid. When he thinks of the Young Men's Christian Association, he naturally pictures to himself a room where a group of innocuous young men are playing checkers, or a hall where an anæmic person with a limp Bible in his hands is exhorting a gathering composed of commonplace young men.

Even if such a picture were really representative once, when the Association was more nearly like its prototype, the original society of drapers' clerks, it is by no means representative now. In one city of the Middle West a very different picture comes to the minds of some of the most successful men when the Young Men's Christian Association is mentioned. They are members of a Gymnasium Club. Down a corridor they see doors opening into a series of compartments. Within one of these compartments a man, wrapped in a blanket robe, is resting after his exercise and bath. Other men are preparing for a game on the gymnasium floor and then a plunge in the pool. An attendant is moving about with the air of quiet efficiency. To others the picture is that of a room in which a couple of gasoline motor-cars are raised, by supports under the axles, several inches from the floor. Around each stands a group of men, one or two with wrenches in their hands. Under one of the cars a man is lying face upward examining the mechanism. They are members of the Automobile To a group of boys in a Western city the Young Men's Christian Association means a room in which the furniture

and the fireplace are their own handiwork and where they gather to read, to plan their games, and to receive, perhaps unconsciously, a good part of their moral training. In a big machine shop once a week, just as the wheels begin to slow down for the noon hour, the men greet with a nod of recognition a newcomer who appears with a bundle under his arm. Taking their dinner-pails, some of them begin their lunch where they are: others gather in one end of the shop; still others set to work distributing song While the men are eating, the visitor chats with one and another; then the men join in a song to the accompaniment of a little portable organ, listen to a direct, homely talk on a religious subject of practical import, and, as the machinery begins the creaking that soon is to grow to a din, return to their places and resume their work. To those men that "shop meeting," a welcome diversion, if nothing more, is the Young Men's Christian Association. A railroad fireman leaves his engine after a night run, makes his way to the Association building, orders a hot meal with steaming coffee, has a smoke in the billiardroom, and then goes up to sleep in a clean bed, glad to escape from the dirty, crowded boarding-houses into a place he can call his own: this is the Association as hundreds of railroad men picture it. To the Japanese soldiers in Manchuria the Young Men's Christian Association, the society bearing the name of an alien religion, is the only place put at their disposal where they can in any comfort read and write.

There is little resemblance between any of these pictures and the scene presented by the gathering of a few drygoods clerks in the purlieus of St. Paul's Cathedral, London, in 1844. Yet out of the latter gathering all the activities which I have illustrated, and scores of others, many equally unlike their original, have sprung. On this continent at least it would be difficult to find a society out-

¹ This is the third and concluding article of the series on the Young Men's Christian Association, written as a result of travel and observation. The other articles appeared under the titles of "Christian Pagans" and "The Exodus from Philistia," in the issues of The Outlook for December 16 and 30, 1905, respectively. Editorial comment on this series will be found on another page.—The Editors.

wardly resembling the first Association. That was little more than a prayer-meeting, composed of young men in the drapery trade. George Williams, its founder, who died only last November, lived to see the Association become a great lay order, masculine in constituency and character, unchanging in religious impulse, elastic in form, indefatigable in experimenting with methods, free from entanglement with any ecclesiastical body, capable of almost indefinite development, adapted to promote by every means individual and social wholesomeness, morality, goodness, righteousness, and prepared to be the instrument of any man or body of men intent on achieving that end.

Like other living bodies, the Young Men's Christian Association has thus been evolved from a very simple organism to one that is complex. At first a society of clerks, it has become adapted to most diverse classes, groups, and com-The Associations established for railroad men soon became a distinct The nature of the railroad species. employee's calling (unless he is an "office man") requires him to live much of his time away from his family. Association provided him with a home away from home. The Army and the Navy branches similarly became differentiated from the ordinary Associations by conforming to the conditions of the soldier's and the sailor's life. College Associations, finding already in colleges certain common instruments used by Associations, such as the gymnasium, the library, and the club-room, met the exigency by developing in other directions. At Harvard, for instance, the Association has been the leader in organizing the philanthropic activities of students. At Yale it is in effect the college undenominational church. Where large factories exist, industrial Associations, so called, have been formed with special reference to the use of workingmen. Associations conducted for colored young men have thrived. Special Associations have also been organized for Indians and for foreigners. Of such as these it is possible for me here only to make mention, to indicate the many modern ramifications of the Association

in America. The City Association, which is the original type, and from which all of these are departures, has been in turn influenced by them, as in the wide adoption of dormitories and the relaxation of arbitrary rules concerning conduct and amusements, both largely due to the example of the Railroad Associations.

One modification in the City Association deserves special mention. This is the development of special departments, and even buildings, for boys. Against this modification one Secretary made to me an emphatic protest. "I advocate the boy's coming into the general building, so that I can see him. He belongs to the organization. I want him to feel that he belongs to it. If a boy has to come in by a back alley entrance or go to a separate building, he'll drop out at sixteen, if he holds on as long as that. In this building the boys have the best rooms." There was no real change of subject when he added: "There is no smoking allowed in the building except in dormitory rooms. don't want any. If we had a public smoking-room, there would be a lot of loafing. It's not very elevating. When a man goes to church, he doesn't claim the right to smoke there; he shouldn't here." This secretary recognized, as most secretaries do, that in dealing with boys he must exercise restraint. Parents who do not want their twelve-vearold son to smoke would justly hold the Association responsible if their son learned to smoke in a public room of a Young Men's Christian Association building. So he applied the same restraint to grown men as to boys, and assumed to decide for everybody what was "elevating" and what was not.

Association secretaries, as a rule, however, are coming to realize that the liberty which it is necessary to deny to the immature it is impertinent to deny to adults. They have already discovered, moreover, that a boy's interests and ideals are not those of a man. Instead of disregarding the men and adjusting their standards to the boys, or of abandoning the boys at the most impressionable age, they have grafted upon the Association trunk another branch, com-

monly called the "junior department." The man in charge of this department is surprisingly often one who has decided talent for gaining the respect and affection of boys. Some of these "junior departments" have acquired a very distinct character of their own. In one the boys have grouped themselves into clubs for various purposes, one of which was composed of the leaders among the boys. In another Association the central interest is provided by the summer camp; material for winter study and recreation is there gathered; esprit de corps is created by preparation for it; and throughout the year the groups of boys are largely determined by their natural grouping as they tent together.

There is an age, however, when the boys are not yet men, though they are no longer boys. It is during this transitional period, which is roughly that of the college undergraduate, that occurs a hiatus in the work of the Young Men's Christian Association. The boy who is entering upon that period is becoming impatient with the restraint that he formerly accepted without question; but as yet he has not acquired the self-control which is expected of the man. It is then, according both to the testimony of secretaries and to the statistics of Associations, that he is most likely to leave the Association, not to return. If, in the attempt to solve the problem of those who, as one secretary expressed it, "are no longer boys and not yet men," the Association should put forth another branch midway between the junior and the senior department, it would act in accordance with its past history.

Coincident with this growth in diversity of forms there has been a growth in organization. This growth amounts to a constitutional change in the Association. By it has been made possible the multiplication of branches. Originally the Young Men's Christian Association was a voluntary organization whose members were its "workers," its officers, its executives. As its interests multiplied the Association employed men to do special tasks. Its first employed officer was called, I believe, a "missionary." Gradually the employed officer became more important. His function, at first

mainly that of a lay preacher and leader of evangelistic meetings, was enlarged. It included clerical duties. He became known, then, as a "secretary"—a title which is still attached to the chief employed officer. To clerical duties were added administrative. As the activities of the Association became more and more involved, these accumulated functions were distributed among several The office of General Secretary was created, charged with the duty of general oversight; the occupant of this office became the chief executive. Subordinate offices were devised-those of Physical Director, Educational Director, Religious Work Director, and the like each charged with some distinct responsibility.

It is this body of employed officers which now really constitutes the Young Men's Christian Associations throughout the land. True, these men are nominally but the employees of a society in which there are many thousands of members; true, certain men elected from these members hold the property and can control its administration. As a matter of fact, however, the members of the Association exercise no authority, and the boards of directors or trustees seldom initiate any plans or guide the development of any project. The active members, who, in distinction from the associate members, have the privilege of voting, are most abstemious in the exercise of that privilege. Indeed, in some Associations their number is not even recorded. The character of the Association is derived almost altogether from the character of the employed officers, its prosperity due almost entirely to their efforts: its limitations are their limitations. I have referred to the Association as a lay order. It would be more accurate, however, to say that the lay order consists not of the members of the Association at large, but of the employed officers. The membership in the Association is fluctuating; the body of employed officers is stable. The members are hardly more than men who pay dues to obtain the privileges which the Association offers, or who engage in the work of the Association incidentally; the employed officers are men who have made. of the work for the Association their calling.

Of the small group of employed officers in a local Association the General Secretary is the head. He is the abbot or prior, as it were. His coadjutors, though nominally chosen by the Board of Directors, are generally selected by him. impresses upon the Association the stamp of his own traits. If he is slovenly, the Association building is in disorder. he is pietistic, the men who gather about him pass the pious phrase like current If he is courageous in making experiments, the Association is permeated with the air of enterprise. If he is broad in his interests and can discern the signs of the times, the Association becomes a stronghold for conspirators on behalf of the public good.

In some Associations the tradition of the old days when the General Secretary and his coadjutors were little else than hired men is still strong. Such an Association I found in one of the important cities of New England. The General Secretary proved to be an amiable man, conscientious in the performance of his routine duties, and as absolutely incapable of doing anything original as he was of doing anything wicked. He was not unaware of the most obvious defects of the Association by which he was em-He deplored its isolation, not ploved. only from the great mass of men, but even from the churches. But he was as helpless in respect of these defects as a coachman is in respect of the domestic infelicities of his employer. He had the special disadvantage of being responsible. not to an individual, but to a society. He was evidently studying to please, not one man's tastes—that is comparatively easy-but the tastes and whims and prejudices of a continually shifting group of people. Personally he may have had the courage of Luther, but officially he displayed the timid caution of a political time-server.

Happily, men of this type are slowly disappearing from the ranks of employed officers. They would disappear more rapidly if it were not for the unconscious influence of the so-called international organization. The fact that the Associations throughout the world are bound

together by a federal organization has made wasteful duplication impossible, and has enabled the Associations to render each other mutual aid: but it has also retarded the growth of independence among the employed officers. officials of the international organization inevitably emphasize the importance of conformity. Uniform reports, which they call for from the secretaries, are impossible without uniform standards; and these standards they exalt. virtue of their position, moreover, they are constantly acting as intermediaries between the Association at large and the public. They are consequently sensitive to any tendency which might temporarily alienate or even trouble their constit-The federal organization has therefore urged upon secretaries the duty of submitting to the authority of their boards of directors. The handbook published sixteen years ago by the International Committee exhorts the secretary to take and keep "a subordinate place," and tells him that "he should studiously avoid making himself prominent in the community, in the press, or in conventions." 1 That such counsel this year would sound somewhat antiquated is due to the constitutional change by which the employed officer is rising out of the position of hired man and becoming a member of a new profession.

This elevation of the employed officer has been the unavoidable result of the process of ramification in the Association itself. When the Association was little more than a permanently organized prayer-meeting, it needed no employed officer; when it became a missionary organization, the only employed officer it needed could very well be a subordinate; but now that it finds itself called upon to solve new problems, to adjust itself to various environments, to become a versatile instrument for social amelioration, it cannot require of the men who are devoting themselves to its service anything less than that they be leaders.

Such a continuously widening experience as the Association has had could not fail to be educative. As the Association has tended to become multiple

¹ Quoted in the Young Men's Christian Association of Chicago Official Bulletin, October, 1905.

in form and more highly organized, it is tending to become broad in spirit. It is now tolerant of much that it once vehemently denounced. The proprietor of a clothing store whose first comment on the Association of his town, when I called to see him, was a condemnation of it for having pool-tables was a survival of a past period. The only real objection to pool and billiards which I could elicit from conservative secretaries was an economic, not a moral, one; the games, they asserted, cost in money and in supervision more than they were worth. But this breadth of spirit is more than a tolerance of what was once thought intolerable. It is not a sign of a loss of convictions, but of the acquirement of new convictions. Perhaps I may indicate the ruling spirit in the Young Men's Christian Association by contrasting its traditional conceptions of democracy and of religion with the conceptions which are now gaining ascendencv.

From the first the Association has been democratic; that is, it has never been deliberately exclusive. Indeed. the more conservative secretaries seem to be the more insistent on democratic methods. One of these told me that in his opinion the Association was losing its democracy. He cited the newer buildings with their marble entrances, their artistic furnishings, their comfort and elegance. Another protested against doing anything for any particular class of men; he wanted everything that was done to be done for all classes. Another criticised the tendency of the Associations to treat men in groups. He would not provide any special accommodation for business men, or for mechanics, or for working boys. "The Association," he argued, "ought to break down class I believe in mixing clerks with feeling. mechanics, especially in social life." On this theory of democracy the Association practically acted for years. The result was that the men who did not care to be mixed with other men indiscriminately, without regard to any common interests, avoided the mixture by avoiding the Association. This was due, not to snobbishness, nor to class feeling, but simply to the fact that men prefer to associate with those who are congenial to them. The Association consequently remained for a long time a class institution. The Associations governed by this traditional view of democracy I found to be the least democratic among Associations; to be, as a rule, composed mainly of clerks, salesmen, small shopkeepers, and the like. If in any such there happened to be a considerable number of artisans, I found on inquiry that they made little use of the building except to patronize the "educational classes," thus remaining a group largely by themselves in spite of the theory under which the Association was managed. The tendency now is to abandon that method of trying to force upon men democracy devoid of class, and in its place to adopt methods which will make the Association a democratic force—that is, a force in which all classes of men can and will participate. In a New England Association where the government had become virtually a close corporation. the secretary proposed that the members be grouped into clubs, each club to be represented on the Board of Directors. In that same Association the "junior department" is organized on that very basis; as a consequence, not only is the membership composed of all kinds of boys-street boys, working boys, and school boys-but the boys themselves direct their department. The experience of other Associations has confirmed the principle that democracy is promoted, not by destroying the barriers that keep the classes distinct, but by providing some service in which men of all classes can share. Association secretaries are. therefore, now more than ever inclined to the practice of forming within the local Association clubs, each composed of men mutually congenial, and at the same time to bring certain men from all these clubs together for certain kinds of service. Men who will never join in a common pastime or mingle naturally on a social occasion will heartily unite in carrying on a series of religious services or in advancing some project for municipal improvement. It is those secretaries who are acting on this idea that have had the greatest success in drawing into their Associations all classes of men.

Of religion, as of democracy, the Young Men's Christian Association is tending to take a broader view. Under the guidance of its employed officers the Association has been far ahead of the churches in practically regarding religion as a matter affecting a man's body as well as his soul. But in its attitude toward all modern intellectual movements in Christianity it has been extraordinarily conservative. It has been afraid of the least intelligent in its constituency. Yet it is growing in courage as it is growing in breadth of view. The narrow, conventional, mechanical, materialistic interpretation of Christianity I have heard in all its baldness presented only once in the various Association meetings I have attended. Then it was at a little noon prayer-meeting in an Association which is almost a byword among secretaries for its depressing lethargy. Less than a score of miles away its reputation for immobility was such that the mention of it was greeted with laughter. other hand. I have heard in several Association meetings interpretations of Christianity given which attempted to make account of the knowledge of the world and the Bible which men have now acquired. Few secretaries with whom I have talked have evinced hostility to the critical study of the Bible; though the opinion of many might be expressed in the words of one: "The religious conservatism of the Association has been its salvation, has kept it out of doctrinal controversy." I think it is very doubtful whether the so-called evangelical test in its present form could be adopted now One Association if presented anew. which I visited has formally discarded it, and is flourishing, though it is deprived of the benefit of the international organization: others have practically ignored

it and have not suffered. The most thoughtful secretaries are very well aware that the Association can no longer afford to disregard those intellectual difficulties which make religion a perplexity to many young men of to-day. Several Associations are supplementing the ordinary classes for "devotional study," as it is called, with courses in the literary study of the Bible. With the increase in the number of secretaries who have had a college training, the Association is less than ever subject to that fear of honest questioning and independent thinking which is the bugaboo of untrained minds. It is finding itself intellectually.

The development of the Young Men's Christian Association has been of the most normal sort. Its present tendencies are the natural product of its past history. Its first period of growth was one of branching out into a variety of forms. Its second period was one of organic development in conformity with the varied functions it was called upon to perform. Its third period, in which it is now entering, is one of intellectual growth in response to the experience it has gathered. These three periods are overlapping. The first is not yet ended. The Association was happily spared in the beginning the incubus of a philosophy or creed. Its capital was, fortunately, not a doctrine, but a religious and moral purpose. Now that the Association is reaching maturity, it can formulate a much truer philosophy than it could have had in the beginning. Its officers are now trying as never before to define its function, to put before its members an ideal. When that function is defined, that ideal formulated, it will not be based on theory and therefore be mechanical, but will be the outcome of experience and therefore be vital and growing.

PRESIDENT JOHNSON'S POLICY

BY JAMES SCHOULER

Author of "A History of the United States," etc., etc.

THE policy initiated by President Johnson upon his accession to office was substantially that which Abraham Lincoln had announced to his counselors and prepared to enter upon before his assassination. this explains readily why Lincoln's Cabinet co-operated with the promoted Vice-President, and—all except Stanton secured for him, despite any misgivings as to his temper or capacity for carrying that policy out, a harmonious and united administration, each member bearing his own share of the obloquy which followed. Some changes in this Cabinet came about naturally. Yet Johnson made no reactionary changes, as various ardent Democrats urged him to do; and his new advisers—Alexander W. Randall, Orville H. Browning, and Henry Stanbery—were Northern men of sound Union affiliations and principle, worthy to be ranked as friends and followers of Abraham Lincoln. For the great Union party of 1864, we should remember, was made up of war Democrats as well as Republicans, and Lincoln was not rechosen, nor even renominated, without a strong factional opposition from most of those radical leaders who now opposed the plans of his associate and lawful successor.

Ward H. Lamon, the friend and former law partner of the murdered President, wrote Andrew Johnson, in February, 1866, that, to his own ample knowledge, as long Marshal of the District, peculiarly intimate at the White House, Lincoln's intended policy of reconstruction was "in exact accordance" with that of his successor; that Lincoln had known well the plans of the Northern radicals and opposed them; that he had meant to bring about "immediate reconciliation" between the sec-

tions, and pursue "a vigorous prosecution of peace." There is other clear testimony, perhaps even more conclusive. to the same effect.1 But how tactfully and patiently, with consummate skill and regard for surrounding circumstances, would President Lincoln have pursued his ends, mingling as he did in his own nature both Northern and Southern sensibilities! He would have held well together his own party support, and avoided to the utmost an open schism. The popular confidence he had gained during his first term would have sustained him. Nor would his guidance have shown inflexibility of methods. He was an ingenious experimenter in politics; yet, having no pride of opinion, he allowed any experiment to fail which was not found feasible. While an emancipator at heart, and, as time proved, a determined one, he had sought first to persuade the loyal border States to emancipate upon the basis of National recompense; he had further proposed colonizing the blacks, when freed, in some jurisdiction abroad; and both these plans he quietly allowed to fail because they proved impracticable.

Andrew Johnson's influence as Chief Executive and reconciler of the sections may be said to have culminated on the Washington's birthday anniversary of February, 1866. He had now been President for more than ten months, and on the whole had administered the Government well, carrying himself with dignity and decorum on official occasions and in the crowded audiences of the White House. Delegations and visitors from all quarters of the Union had been well impressed by his frank and generous utterances, made in the full sincerity of a high official purpose. Once, since Congress had met and measured its majority strength against him, he had met its reconstruction measure with a

¹ See Schouler's History of the United States, vol. 6, page 616, and citations.

¹ Among those suggested for the Cabinet by letter to President Johnson, during his first year of office, were Dickinson, Sumner, Charles Francis Adams, and John A. Dix, for Secretary of State; also General James B. Steedman (whom influential men of all politics indorsed) and Francis P. Blair, Jr., for Secretary of War. 264

veto, and had prevailed. The first Freedmen's Bureau bill, as framed and passed by the two Houses, was liable to objection at the South as fostering something of a military despotism; and the President, when returning the bill, avowed that he shared with Congress a strong desire to give the colored freedmen an adequate security and protection. Good Union men at the North, tried and true, stood with him on this veto; nor was any breach among his sympathizing supporters perceptible.¹

٠,٠

For the holiday celebration of February 22 various mass-meetings were planned in Northern cities to sustain the President's policy as against Congressional obstructiveness. With Southern States excluded from representation, a majority, but not two-thirds, of each branch was against him. The monster demonstration of this kind—and a notable one indeed—was at the Cooper Institute, New York, in the evening. Francis B. Cutting, a prominent citizen, presided; and among those who figured in an imposing list of officers were Hamilton Fish, William C. Bryant, David Dudley Field, Senator Edwin D. Morgan, and Representatives Henry J. Raymond and William A. Darley. There was an immense crowd and great enthusiasm. Among the chief speakers were Denison, of Ohio-lately war Governor of that State and now the Postmaster-General-Raymond, and Cutting.

But the star speaker of this meeting was Seward, the premier, whose sentiments had been held in reserve and whose commitment at the present time was highly significant. His sickness, his narrow escape from assassination, and a more recent domestic bereavement, enhanced the sympathy of his fellowcitizens upon this first emergence from seclusion. Seward spoke amid a storm of cheers and applause. His speech was a deliberate one, and deserves a close study. Between the lines we may read that he feared an approaching breach in the great Union party; that his effort was to soothe, to reassure, and to keep

down the antagonism now developing between White House and Capitol Hill, among statesmen of fierce and willful temper. He said nothing of vetoes nor of negro rights nor of new guarantees, but he argued most strongly against all vindictive procrastination of peace; he protested against the present disposition in Congress to keep States indefinitely out and unrepresented; he opposed all proconsular or imperial government at the South. To the vindictive of his party associates he quoted with point the two fathers of a familiar comedy whose children, after much tribulation of disobedience, had come into the marriage originally designed for them. "Why not forgive?" says the one: "it has all turned out at last as you wished it." "Damn it," says the other, "because I have not had my own way of having it." "There never was and never can be," said Seward, " any successful process for restoration and harmony among the States except the one which the President has undertaken." At the same time, he contended that the whole difference at the present time was one of pilots. "The country is completely safe," he proclaimed, "and will not be saved over again in this day and generation. It will be safe if you approve what the President says; it will be safe if you approve what the majority in Congress says; safe if you believe what they both say; safe, too, if you disbelieve and reject what they all say."

On this same Washington's birthday, Andrew Johnson in person began undoing all the good that he had thus far accomplished by making a highly imprudent and undignified speech from the White House balcony to a miscellaneous holiday throng of Washington residents who came thither to hear him. an exordium, duly prepared, which set forth the reasons of his reconstruction policy in language unobjectionable, he yielded to various calls from the crowd (some of them probably his personal enemies who meant to shame him), and, with tongue unloosed as his temper rose, he berated by name his political foes. "What has Andy Johnson done?" was the theme of his rambling remarks at the close, as he complained of the fierce

¹General Sherman, February 4, had written him from St. Louis, expressing his hope that radical ideas would not prevail, and wishing that the President might carry out the entire pacification of the Union according to "natural laws." Johnson MSS.

assaults now made upon him by Northern radicals in and out of Congress.¹

Congress now passed its Civil Rights Bill for the negro by a significant twothirds vote in the two Houses, and the question with Andrew Johnson was whether to interpose a veto, likely to prove futile, or to improve his last good opportunity for composing the new political strife and reuniting his support. Two earnest letters reached him while he deliberated, both from prominent men at the North hitherto among his friends. One of these, March 17, was from Henry Ward Beecher, who besought the President to sign the Civil Rights Bill, both "because it is right" and because "it will harmonize the feelings of those who should not differ." The writer realized "the deep tide of moral feeling North," and had suffered among his own friends from being thought a supporter of the Administration policy. The other letter was a long one, March 22, from Governor Jacob D. Cox, of Ohio, a gallant soldier, whose support had been open and constant to the present date. The advice he now tendered confidentially was frank and outspoken, yet judicious and respectful in expression. "The Western sensitiveness," he wrote, "is great lest the advantages of this war be lost now by a mistaken statesmanship. We should conciliate the loyal spirit, wherever we can do so without sacrifice of principle." Since lately returning from Washington he has been impressed with the belief that the Democratic party are hypocritical in supporting the President's policy. And most earnestly he wishes the President to approve the Civil Rights Bill—to "strain a point in order to meet the popular impulse, rather than make a strict construction the other way." "My own view," continues the Governor, "is that ultimately it will be found that a separation of the races will be found necessary; but as no one can tell how long it will take natural causes which are at work to bring about that result, I recognize the necessity and propriety in the meantime of giving to the freedmen a large measure of kindness and protection, rather than in any way to stint the justice they have a right to expect. . . . Though some provisions for enforcing the civil rights bill are objectionable, yet they are civil provisions, under the check of laws and legal responsibility, and not the unrestrained despotism of military power which was embodied in the Freedmen's Bureau bill."

President Johnson, however, returned the Civil Rights Bill to Congress March 27; the two Houses speedily passed it over his veto-even Dixon and Doolittle among his friends failing to sustain him in the Senate on this occasion—and the bill became a law without his signature. And so it was, later in the session, with a new Freedmen's Bureau bill, better framed than the original one for meeting his objections. The breach between the Executive and the present Congress thus became irreparable, with two-thirds in both branches instead of a majority Johnson's now unified against him. obstinate resistance was largely maintained on the argument that they had excluded rightful representatives of the South, who, if admitted, would have reversed results. The Fourteenth Amendment passed Congress presently, in an utter disregard, though constitutional, of the President's wishes or participation, and finally Tennessee alone from the insurrectionary region was admitted to representation. The long session closed with the rupture complete between Executive and Congress, and each prepared to test its strength with the country at the fall elections. Now, as Andrew Iohnson's supporters concluded, the line would be drawn distinctly between friends and foes, and men must take one side or the other in the approaching campaign.

Yet, in justice to Johnson himself, it should be conceded that the new President steered clear of Tylerizing, and would not commit himself to those peace Democrats who now saw the chance for cementing anew their old alliance

¹ It was widely reported and believed at the time that the President had fortified himself for this critical occasion by a glass too much. Such was certainly the case when he was inducted Vice-President and got into the same rambling and undignified vein; for of that fact his own MSS. preserves the proof, and he had doubtless resolved not to repeat the offense. Johnson probably resorted less frequently to alcoholic stimulants than some of our most famous generals; yet the few occasions of such exhibition were highly unfortunate for him and his supporters. He carefully preserved, however, among his papers some newspaper reports of such colloquial speeches, with verbal corrections by the pen, as though not ashamed of them.

with the South. New York Democrats labored in vain with their Washington friends to get Seward turned out of the Cabinet, and to have the whole Government patronage bestowed on their political behalf. In November, 1865, Preston King, Collector of the Port of New York, had died suddenly, but after an interval of many months the successor selected for this chief custom-house and post of local patronage was one whose personal integrity as a financier was regarded, and not his political influence.

Every little while, through all these first twelve months, had come a petition to the President from one quarter or another to appoint Francis P. Blair, Jr., to his Cabinet. Johnson's manuscripts show, as to the three Blairs, that they made strong and mischievous effort to embroil him with his Republican sup-But counter advice reached the President to "keep the Blairs out of his confidence," and such advice went not unheeded. Blair senior is seen in March, 1866, urging the President to veto the Civil Rights Bill. His son Montgomery-ex-Postmaster-General under President Lincoln, and now a leading practitioner in the Supreme Court—was incessant with written advice; and, living as he did near by the White House, he probably had many oral interviews besides. Letters from his own correspondents are in this manuscript collection, indorsed with sharp comment of his And frequently Montgomery Blair is seen seconding the New York efforts to have Johnson make alliance with the Democrats, reorganize National politics, and, displacing Seward as well as Stanton, make up a new set of advisers for his administration.

A letter of April 11, 1866, appears explicit enough on this point. Some had said that Blair bore a grudge against Seward; not so, he replies, and he has no reason for any, for Seward had done him various personal favors. "My strenuous opposition to him arises solely from the conviction that he, more than any one else, is responsible for the Civil

War, and that he is doing all he can to involve us in another by striving to keep the so-called Union party consolidated. . . . Though he is making an effort to keep up a conservative section within the Republican party, it is the avowed purpose of his associates not to break with the party. . . . Democrats are anxious to support you, and hence it is of the first importance to unite the Republicans who agree with you and the masses of the Democrats in order to restore the Union. . . . You should not keep Seward any more than Stanton and others who are known to oppose you. Mr. Stanton is acting in concert with Mr. Seward. The radical press are restrained from attacking Mr. Seward while pouring out their wrath against you."

Possibly it was with reference to this former Cabinet associate rather than to any present co-adviser that Secretary Seward is reported to have said about this time, in the course of a table conversation, that the new President was certainly a wise Executive in this respect—that "he did not tell one Cabinet counselor what another one had said of him."

One more letter is worth quoting in the present summary of President Johnson's first year's correspondence. once more, was supplied to his portfolio through the Blairs, who perhaps had been sounding the writer to find how far he would go in diverting Sumner's hold upon the Republican party in Massachu-John A. Andrew, now ex-Governor of that State, and practicing his legal profession, had visited Washington early in 1866. His letter of March 18, after his return, seems to have been written under some promise made to the elder Blair, but he inclosed it to the son, Montgomery. "My views," he writes, "were as clearly expressed in my valedictory as in my power. Those convictions I had reached after much disinterested and independent study and thought; and everything I have seen since has confirmed me in those conclusions." He was not ready to come out against the radicals of his State at the present time, and although by no means vindictive towards the South, as Sumner was, he plainly favored some experiment of negro suffrage, and otherwise strongly

¹ Thus, a friend writing him early from Florida that the Chief Justice's tour (see The Outlook for January 13, p. 72) was to secure that State for his own succession, with the aid of corrupt agents, Blair turned over the letter, with his written advice that "the Chase vermin should be squelched out."

wished to do the freedmen justice. "The country," he writes, "is settled on one point, viz., that the rebel States ought not and cannot be returned into the Senate and House without conforming to some arrangements made necessary by the rebellion, in order to adapt their constitutions to the changed relation of slaves." The difference between the President and Congress was only one of method, as it seemed to him. "I am myself opposed to public meetings of either interest, of any man, leader, or party, . . . and in this remark I include President Johnson himself." In short, Andrew was for soothing public sentiment and not irritating; and he felt no

doubt that the people would settle down on these points: (1) The extension of suffrage to all qualified therefor, without respect to condition, color, or descent; (2) universal amnesty for engaging in the rebellion; (3) requiring the popular vote of those classes of persons entitled to vote in 1860, and who had carried their own States into rebellion, on the adoption or rejection of the measures proposed as the basis of reconstruction in their States respectively. He saw no possible hope for peace on other conditions; and to him appeared otherwise, as the only final alternative for the South, the extermination of one race or the other.

SOME EXPERIMENTS IN SUNDAY-SCHOOL WORK

BY THOMAS DOANE PERRY

O those who are watching the progress of our Sunday-schools it is gratifying to note the new and improved methods of work that are coming into use and the strong evidences of a determination to better understand and serve the religious needs of immature and growing lives. As a rule, Sunday-schools are far less efficient than most modern educational organizations. The past half-century, it is true, has seen many admirable methods of work, but it has also been characterized by an inability judiciously to eliminate such as have been inadequate to changing conditions and improved standards.

In general, it may be said that the older method of Sunday-school work was to select a series of verses or chapters from the Bible, and search for their applications to the problems of life; the newer way, and one that is rapidly coming into deserved use, is to begin with life problems and find help toward their right solution in Bible truths and characters. This latter method is especially interesting to young people at the time when standards and ideals of life are in their formative period. Between the ages of fifteen and twenty there is a natural reticence that leaves many im-

portant questions unasked, and yet it is a time when the keenest interest may be roused in the discussion of problems relating to Christian manhood and womanhood in the different activities of our complex modern life. Young people of this age need to be shown that religion and life are closely related, and that the practical solution of every-day problems, large and small, may and should be found in the truths of the Bible.

It has been a source of interest and pleasure to the writer to attempt a few experiments in somewhat unconventional lines of Sunday-school work. These have been laid out year by year, as conditions have suggested, and are therefore a gradual growth. Every experiment has been tried and proved workable. They were made upon a class of a dozen boys, ages averaging seventeen, who had the indifference and aversion to Sundayschools characteristic of their age. environment was a small city church, scarcely holding its own against the larger "downtown" churches, and lacking in its ability to reach and hold young people. The boys came from widely differing homes—a few where standards and ideals were high, a few where parents had been able to give them little that starts a boy on the right road in life. About half the boys were still in school, and the rest at work.

The first experiment was a series of informal talks, based on chapters from Dr. Josiah Strong's book, "The Times and Young Men," with such titles as these: Three Universal Laws of Life, Service, Sacrifice, and Love; Present Social Conditions; Value and Use of Time; Bodily Health; True Worth of Education; Amusement Problem; Choosing a Profession; Use and Abuse of Money; Religious Problems of the Twentieth Century. These talks were given by the leader and followed by a discussion, often quite general and engrossing enough so that the superintendent's closing bell failed to attract atten-The appointment of a programme committee by the class, to select and submit courses of work, and the approval of each course in advance by vote, avoided dissatisfaction with the work under consideration.

In the second experiment talks followed by informal discussions were given on some of the prominent Old Testament characters. The introductory themes were: Inspiration of the Bible; Its Literary, Historic, and Scientific Value; Principles of an Evolutionary Creation; Helpful Conceptions of God; Beginnings of the Human Race. Following these were talks on Noah, Abraham, Lot, Isaac, Jacob, Joseph, Moses, Joshua, Gideon, Samson, Samuel, Saul, David, and Solomon. These character sketches dealt more particularly with the human side of these men, the odds against which they struggled, and the success they achieved in spite of obstacles. The treatment was largely new to the boys and held their interest. Little or no direct Bible study was done, and much of the matter presented was that approved by modern Bible students and critics.

Experiment three was an attempt to help the boys in settling the all-important question of a life-work, a problem toward the solution of which too few practical aids are usually given. The course comprised two series of talks on alternate Sunday noons; one by prominent men of the city, eminent in their professions, who explained the opportunities and ob-

stacles in their chosen work and summed up the inducements offered in the various fields to a boy who desires to become a vital Christian force in his life-work. In this way the following professions were presented: Law, Ministry, Teaching, Medicine, Engineering, Finance, Agriculture, Mercantile Life, Railroading, Manufacturing, Insurance, and the like. The boys were eager to improve the opportunities offered to ask questions.

The boys themselves were asked to give the other series on the lives of influential men of modern times, among whom were Edison, Agassiz, Henry Drummond, Cecil Rhodes, Bismarck, Joseph Jefferson. Horace Greeley, Phillips Brooks, Booker T. Washington, Robert E. Lee, Gladstone, Edward Everett Hale, Marshall Field, U. S. Grant, Roosevelt, Charles W. Eliot, and Dwight L. Moody. It was thought that careful preparation for one or two talks during the year would be of greater value to the members of the class than a more or less desultory study of successive lessons.

During this experiment the leader of the class was absent nearly four months on account of sickness. The class, through their president, faithfully carried on the work according to schedule, engaging and assigning speakers, with only slight assistance from the Sunday-school superintendent. All regular meetings were kept up and well attended.

The next experiment was more along the line of Bible study—a course in the life of Christ, considered topically. Theological discussion was avoided so far as possible, and yet such phases of the subject were studied as are puzzling to us all. The following topics were selected for the series of talks, given mostly by the leader: Prophecies Concerning Christ; Birth of Jesus; Education; Young Manhood; Temptation; Parables; Miracles; Disciples; Public Opposition; Last Supper; Betrayal and Trial; Crucifixion; Resurrection; Significance of Christ's Life in History; Christ, the Man; Christ, the Teacher; Christ, the Physician; Christ in Art; Christ in Literature. The effort was made to present these subjects thoughtfully and reverently in the light of modern

research and criticism. Care was taken to discuss both sides of disputed questions, thus giving the boys opportunity to weigh arguments and form decisions for themselves.

Alternating with the above were addresses, given by men active in municipal affairs, on various civic problems, chiefly those of local interest. The aim of this course was to develop in the boys just coming of age an interest in the affairs of the city and a feeling of responsibility for their good conduct, and also to show that the best type of Christian manhood is one that takes an active part in municipal life. The following topics are representative: City Organization, given by the Mayor: Municipal Ownership; Board of Health Problems; School System, given by the Superintendent of Schools; Parks and Boulevards; River Navigation; City Library, given by the Librarian; Board of Trade; What is Done with Tax Money; Young Men's Christian Association; Hospitals; Ideal Newspapers; Liquor Problem; Union Labor. Several of these topics were presented by those of the boys whose regular work put them in touch with that special phase of city life. Close attention was given to these speakers, and the growing interest in anything pertaining to the welfare of the city was quite evident. By unanimous vote of the class this course was continued another year as mentioned below.

The experiment now in progress consists of three distinct courses, the first of which is a series of talks on the history of religions, non-Christian and Christian, given by the leader twice a month. The following topics will give an idea of the course: Beginnings of Religion, Vedic Hymns, Brahmanism, Hinduism. Buddhism, Confucianism, Zoroastrianism, Mohammedanism, Shintoism, Judaism, Catholicism, Episcopalianism, Congregationalism, Other Evangelical Denominations, Salvation Army and Volunteers of America, Community Religions, Christian Science, and Spiritualism. This course was suggested by one of the boys, and, as outlined, indicates the influence of ancient Oriental religions in the shaping of Christianity, as well as the various forms Christianity assumes to-day. The intelligent questions asked and the keen interest shown prove that such material is well suited to rouse interest and stimulate thought in boys of that age.

The second course is a continuation of the civic work by speakers outside the class once a month. The readiness of busy men who are carrying heavy responsibilities to contribute their time and strength for a talk to a class of young men is a fine evidence of the earnest Christian manhood to be found among our representative men in the different departments of professional and business life.

The other is a series of debates by members of the class once a month. The subjects of these debates are drawn chiefly from local civic problems, but include municipal ownership, organized labor, and Sunday observance. In these, as in work previously assigned to members of the class, almost no difficulty has been experienced in persuading the boys to take their parts. They seem to realize the value that such work may be to them, and the need of their contributing something to the work of the class. As one of the last debaters said, "You fellows all ought to debate, because you learn so much doing it."

In addition to the regular class work, a club modeled after the college fraternity was formed for social work among the boys, but the two organizations have been entirely independent of each other. Besides regular meetings the club has given one or two plays, an annual banquet, a dance, and occasional canoe parties and sleigh-rides. The fraternity idea has been of much assistance in holding the boys together.

These five experiments constitute about four years' work, although the last one is not yet finished. During this period the interest and enthusiasm in the class have grown slowly but perma nently. None of the original members of the class have been lost except through removals or death, and the membership has considerably more than trebled. A number of the boys have materially lengthened the time they intended to give to their education, several now being in college. A wholesome respect

has come to the boys for religious work, and many of them are active in the various organizations of the church. In spite of its perplexities, the form of work here described abounds in interest and satisfaction, and the leader is by no means the least of those who receive full value for the time and energy invested.

THE IGNORANCE OF "GOOD" CITIZENS

BY J. HORACE McFARLAND

President of the American Civic Association

"I—I don't know."
"Is there a legal limit to the bonded debt, and has it been reached?"

"Indeed, I've forgotten!"

"Do you remember the tax rate?"

"Er—well, it's pretty high."

"What is the total valuation, or assessment, for tax purposes?"

"Let me see; I think it is about—no, I don't remember."

"Do you know what the basis of the assessment is?"

"It seems to me it is about full valuation. Wait; no, it's seventy-five per cent., I think. You see," he added, apologetically, "I don't look after these things. I'm not in politics!"

The speaker was my host in a mid-Western city, in which I was to address the local improvement society that evening upon the necessity for a civic awakening. He had just been telling me how his good wife had been endeavoring to have the Mayor and the city Councilmen come to hear me, and he added, as we drove along in his well-appointed brougham, "I hope you'll stir them up; we need all sorts of improvements."

Then followed my questions; for improvements cost money, and the first thing to be considered is, Where is the money to come from? But my host, active in the forward movement in his

city, a man of intelligence, wealth, and position, a typical "good" citizen, didn't know the first thing about the statistics, the finances, and the taxing plan of his own town. Wait; I wrong him—he did know, and state with pride, the population of the city. "We have thirty-five thousand people here," he said, "and we will surely have fifty thousand by 1910"—all this with great pride. "And we have the greatest implement factory in the State; I tell you, we're growing right along!"

I never knew one to fail on the population! But my friend's ignorance as to the town finances was not at all singular or unusual, and I was in no way surprised. The next day I called on the Mayor of this lively little city, and he told me what I wanted to know, except that even he got the tax rate doubled, correcting himself shamefacedly before I left, after telephoning to the City Clerk.

That evening I was to speak on the same subject in a progressive city claiming more than three hundred thousand inhabitants. At the pleasant dinner before the address my hostess—it is always a good woman who starts these efforts!—introduced me to some representative citizens, fine men all of them. One, an architect of prominence, was also president of a business men's organization. Another noted architect was there, and also the very active secretary

of another trade organization. An exjudge, the senior member of a prominent law firm which represents a large telephone company, sat next to a prosperous leather merchant.

I put the same questions asked above to the whole table. The silence was eloquent until the hostess asked us, "Would we have more of the salad?"

But the judge, when he had reflected, did know the constitutional debt limit, and the secretary added to it the fact that a State law provided for a five per cent. annual sinking-fund tax. No one was entirely sure as to the exact tax rate, and not one of these selected "good" citizens knew enough about the city of his home to tell me how the parks were sustained.

A few weeks before I had visited another and larger city of great progressiveness, having for its Mayor a man of National repute, and the most efficient Chamber of Commerce I have yet learned There was a great civic gathering, of. and my host was the owner and editor of a daily paper of considerable prominence. I catechised him about the city's financial condition, but he was blissfully ignorant, except that "C--- was growing very rapidly, sir!" Pursuing my inquiries at the City Hall, I finally found one man, a Commissioner of Public Works, who was thoroughly well informed. The rest of the officials knew a little, but not enough to hurt!

I might cite many more instances of the ignorance about city business affairs that I have uniformly encountered among the "good" citizens in dozens of cities I have visited in the last three years, but I think my point is plain. I cannot record one instance of even relatively complete primary knowledge-just primary knowledge of city affairs, I mean possessed by any one man I have interrogated, unless he was a city official. Indeed, in one case, that of a Middle States city of about seventy thousand population, in which I had a two hours' informal conference with the Mayor and the Councils about a park system, there was not a man among them who definitely knew the assessed valuation upon which taxes were assessed, or the total of the city's current bonded indebtedness.

Of course I do get interesting sidelights in answer to questions. The ex-judge with whom I dined as above mentioned, and who introduced me later to an audience of his townspeople, told me how he had drafted a bill, and helped have it passed by the State Legislature, permitting his telephone company to erect its poles on any city or town street, or on any country road, without regard to local conditions or objections, and but slightly subject to any regulation! It is in that State just as if in New York the Legislature had given telephone companies the right of eminent domain, permitting them to plant poles at will in Manhattan!

But my desire is to emphasize the danger-indeed, the criminality-of the prevailing ignorance of "good" citizens about the financial affairs of their own home cities and towns. Many a man who reads this can talk luminously about the Panama Canal, upon which he has opinions, but cannot tell the debt or the debt limit of his own city. Another will tell you just how the railroad rates should be regulated, but he will be absolutely ignorant as to the cost of water or of electric lights locally. A sneer will be heard from your friend about the ignorance of the lately resigned president of a great insurance company as to salaries paid to his associates; but can he tell you the salary of the Mayor of his city?

A municipality, large or small, is responsible for its debts, and the citizens thereof supply the money, in the shape of taxes and assessments and rates, to pay those debts and to run the business of the municipality. Every dollar of taxable property the citizen has is liable for the debts of the municipality. That is, the assessed valuation of a city is its capital fund, upon the credit of which it may borrow money on bonds issued, and the taxes provide its working income and its means of repaying loans. most commercial corporations the stockholders know with more or less accuracy the capital stock, the bonded indebtedness, the rate of dividend, and the value of the property; yet in the municipal corporation, of which each taxpayer is a stockholder, with all his property liable to assessment, ignorance of these primary details is the rule, and knowledge the exception.

Really good citizens are intelligent citizens, who are informed at least upon the fundamental facts of the finances of their immediate municipalities. Ignorance always promotes "graft," and for such ignorance the taxpayer, who carelessly pays without knowledge—but often with grumbling—and votes without information, has no excuse.

Whenever business men are businesslike in their relations as citizens to municipal financing; whenever they consider taxes and assessments and bonds and salaries as they would in private or corporate life; in short, whenever "good" citizens are honest in knowledge as well as in criticism, grafting will become a hateful memory only.

I want to suggest a little catechism for citizens to ask themselves, in the hope that where the answers are at first missing, investigation will supply them. Only when these or equivalent queries can be answered from memory with an approximation to accuracy is a "good" citizen really fit to vote upon any local affairs involving the use of money:

What is the assessed valuation of your city or town?

Is it a full valuation, or at an agreedupon discount from the real value—that is, if your property is assessed at \$5,000, would you be willing to sell it for that sum?

How is this valuation determined, and how often is it revised?

What is the city debt, and what rate of interest is paid upon it?

What sinking fund provision is there for the repayment of the bonded debt?

Is there a constitutional debt limit, and if so, to what per cent. of the valuation may your town borrow?

What is the total tax rate, and how is it divided for city, school, and State or county uses?

These are the bare *primary* facts, knowledge of which is essential to honest and intelligent voting. A really efficient citizen will soon want more information, and get it, as to water rates, paving assessments, park maintenance, electric and gas light costs, the granting of public franchises, and other things for which he pays his money. He can't know too much!

with his governmental relations. All

SOME BOOKS ON SOCIOLOGY

HESE volumes treat of different aspects of social questions, and in different methods. We here attempt simply a description of the books for the benefit of the lay student of the social problem.

Professor Small defines sociology as "the process of human association." It includes economics, jurisprudence, ethics, and politics, as these are defined by Professor Seligman. For sociology deals with society as a whole, while economics deals with man's industrial relations, jurisprudence with his legal relations, ethics with his moral relations, politics

these relations have been more or less the subject of action since the days of Moses, and the subject of study, at least, since the days of Plato; but the term sociology Professor Small attributes to Perhaps a more important division of sociology, or at least of sociologists, is one which Professor Small suggests. He puts them in four classes, according to their point of view: 1. The historical sociologists, who inquire how men came to associate as they do now. 2. The scientific sociologists, who inquire how they manage to preserve the status 3. The prophetic sociologists, who are interested in inquiring what are the present indications as to the ways in which men will associate in the future. 4. The practical sociologists, who ask what is the thing to be done to make the association better than it has been and We wish that Professor Small had

followed this division in his volume, and told us historically how society has developed, what it is, whither it tends, and what we can do about it. His book indicates that he has the scholarship for the first and second tasks, the vision for the third, and the humanity for the fourth. But this he has not done. stead, he has devoted the first half of his volume to a report, interpretation, and criticism of Spencer, Schäffle, and Ratzenhofer, which may be of great interest to the special student, but are not interesting or valuable to the general reader, and do not appear to us essential to the second half of his volume, which contains his own interpretation of sociological laws. Nor is this portion of his book written so as to be understood of the common people. It is academic both in its structure and its phraseology. one of his sentences he refers to "what we speak of in sociological jargon as the subjective environment." There is more "sociological jargon" than there needs to be in his pages. In brief, his volume is rather for the student, perhaps we might say the advanced student, than for the interested but not especially prepared thinker on sociological problems.

In this respect Professor Seligman's book differs from it radically. treatises on economics are generally made well-nigh unintelligible to the laity by reason of their economical jargon. Professor Seligman's treatise is remarkable for its lucidity of definition and its simplicity of phraseology. nitions at once so clear, so simple, and so accurate we have rarely if ever met in the literature of economics. Take, for example, wealth. Wealth is a commodity or service which possesses three qualities: first, utility—if the thing is of no use it is not a good at all; second, externality-skill, intelligence, virtue, are not wealth: a man is not wealthy until he has transmuted his intellectual qualities into some external object; third, limitation in amount—if it is free to all, its possession may make him happy but not wealthy: enjoyment of sunshine is not possession of wealth. Along with this lucidity and accuracy we find a balanced judgment; as in the author's recognition

of other than economic motives in the inspiration and direction of industry, in his dismissal of the "economic man" as a being that has no real existence and a fiction that is of no service; and in his recognition of the value of both the deductive and the inductive method in the study of economics. His volume is, we take it, intended primarily as a text-book, but it is, what text-books very rarely are, fascinating reading to any man interested in economic problems. Some of the conclusions will surprise uninformed readers of the capitalized press, as, for example, these (we condense): permanent gain from a successful strike often outweighs the temporary loss of all strikes, including the failures. growth of unionism has brought with it amelioration in the conduct of strikes and lessened their number. Unionism has been, on the whole, a conservative force. We commend this volume heartily to any thoughtful layman who desires to get from a responsible authority some grounding in the essential principles of industrial laws.

"The Sociological Theory of Capital" is a new edition, with a valuable introduction and annotations, of a volume published in 1834. The author should not be confounded with the John Rae who is the author of the well-known "Contemporary Socialism." The biographical sketch gives a pathetic picture of the author's struggle with an adverse fate—a picture which exemplifies the truth that it is almost as perilous to attack orthodoxy in economics as orthodoxy in religion. The preface gives the reader an admiration for the moral courage and the intellectual acumen of the author. His book is an attempt to show the fundamental errors in Adam Smith's "Wealth of Nations"-a book which in 1834 was regarded with almost as much reverence by orthodox economists as was the Bible by orthodox Protestants. How radically he differed from Adam Smith is indicated by the following quotation from one of his chapter headings in the Table of Contents: "Instead of there being any grounds for a presumption against legislative interference, from the assumption that nature ought to be allowed to pursue her own plans; the

presumption is, on the contrary, that nature gave man his peculiar faculties for the purpose that universally, and as well here as elsewhere, he might acquire the direction of events, by discovering the laws regulating their successions." We do not remember to have seen more clearly and forcefully stated the argument for protection from its effect in promoting diversified industry and reducing the waste caused by expense of transportation. Mr. Rae's book is neither as radical nor as original as it was in 1834, but it is interesting as a contribution toward modern thought by a bold, original, and independent thinker. fessor Mixter ought not to have given to the public such a volume as this without adding an index.

"Trade Unionism and Labor Problems" we may dismiss with few words because it is impossible to deal with it in detail within our limits, and general criticism is in the nature of the case impossible. For it is composed of twentyeight entirely separate essays on distinct aspects of the labor question, and contributed by different authors. A number of them have primarily seen the light in periodical publications, and all of them may properly be classified as periodical literature. Some of them are of more transient value than others. All of them are written by authors who are in general sympathy with labor organization, but we think none of them are written for the purpose of advocating trade unions and their methods. In other words, they are not partisan papers; but their authors make no pretense to that bloodless and unhuman spirit, miscalled scientific, which can treat problems of human life, in which moral principles are involved, and on which both the moral and the material welfare of the community depend, as though they were problems in algebra or geometry. The volume is full of valuable information, but it is rather material for the student than history, philosophy, or sociology for the general reader.

In this respect "The Coal Mine Workers" differs radically from it. The author, Frank Julian Warne, is known to the readers of The Outlook by his contribution through our pages to their knowledge of the coal situation in Pennsylvania. He is one of that class of students of social and industrial conditions whom science and humanity combined have produced in America, and who are distinctly a product of a democratic country and a scientific age—that is, of a period in which love of humanity and love of truth are mingled in something like equal proportions in its best teachers. In our judgment, this book deserves to be characterized as an authority, and, as far as we know, as the best authority, in the limited field of which it treats—labor organization in the coal fields of the United States.

Comment on Current Books

Apostolic Succession and the Problem of Unity

Except for its untoward bearing upon efforts toward church unity, the majority of

Christian people in English-speaking lands care nothing for the fiction that the clergy of the Anglican, Greek, and Roman Churches, and only they, are the genuine successors of the Apostles, and that these three alone constitute "the Holy Catholic Church." Against this fiction the Rev. Edward McCrady, rector of Grace Church in Canton, Mississippi, argues temperately and cogently with the "Catholic" party, who would commit the Protestant Episcopal Church to its support. Giving historical and documentary proof that neither this Church nor the Church of

England has officially adopted their theory, he contends that it is a mere theory, and one whose consequences are most to be feared by its supporters. "Let us beware lest we to-day, in vainly boasting of a mere outward succession from the Apostles, are not, like the Jews of old, losing the true inward succession that is alone of permanent value." The appropriate typographical style of this volume is highly creditable to Sewanee. (The University Press of Sewanee, Tennessee.)

The Castlecourt
Diamond Case
An amusing detective
story in which the author,
Geraldine Bonner, carries
her reader through many complications by a
compilation of statements supposed to be

made by half a dozen or more people involved in the mystery—a not very probable thing in itself, but one productive of some queer contrasts. The plot is frankly farcical. (Funk & Wagnalls Company, New York. \$1.)

This is one of the books en-The Egyptian larging knowledge for which Sudan the world is debtor to Christian missionaries. The account given of the Southern Sudan by the war correspondent Steevens, in his book "With Kitchener to Khartum," describes it as a worthless land, "a God-accursed wilderness." We have our own "bad lands" in the far West, but an account of these is no fair description of our country as a whole. The same may be said of Steevens's account of what he saw of the Sudan. Dr. J. K. Giffen, a missionary of the American United Presbyterian Church, tells another story of it. It was, indeed, almost depopulated by the Mahdist wars during the last two decades of the nineteenth century, but it is a land of splendid possibilities, the remnant of whose inhabitants is beginning to feel under British protection the healing and uplifting hand of Christian civilization. Dr. Giffen's book has much to say of this, in his interesting account of the people and their traits and customs. It is practically the only reliable and complete account in print of an interesting and promising country, of which the earliest mention is attributed to the eighteenth chapter of Isaiah. (The Fleming H. Revell Company, New York. \$1, net.)

A scrap-book of expert The Empire and opinion concerning the the Century more important problems now confronting the British Empire and its several parts, this remarkable symposium of nearly nine hundred pages brings together a mass of information of substantial value to many classes of readers. Its predominating note is Chamberlainite, but the editor has included papers written by authorities who roundly differ from Mr. Chamberlain. Thus, a lengthy argument for protection by Mr. J. L. Garvin is followed by a defense of free trade from the pen of Mr. J. St. Loe Strachey. In all, the book contains over fifty essays and an imperialistic poem by Mr. Kipling. It is impossible even to mention the names of the various contributors, but an idea of the sound usefulness of this compilation may be gained from the statement that, in addition to papers dealing with the problems of empire in a general way, detailed studies historical, political, economic, and military are made of each of the colonies and dependencies. There are six articles on Canada, ree on Australia and New Zealand, six on

India, six on South Africa, four on Egypt and the Sudan, and one each on the West Indies, Ceylon, Burma, the Straits Settlements, the British possessions in West Africa, and the East African protectorate. In every instance the writers are competent to treat of the themes allotted to them, and if their views are frequently colored by political preferences, they are nevertheless informative and deserving of close attention. Among the more general essays perhaps the most noteworthy are the contributions of Messrs. W. F. Monypenny, Bernard Holland, Richard Jebb, and John Buchan, who write respectively of "The Imperial Ideal," "The Crown and the Empire," "Imperial Organization," and "The Law and the Constitu-tion." The last two deal with the different expedients whereby a closer union of the mother country and the colonies may be effected, and it is interesting to find that both Mr. Jebb and Mr. Buchan (avor the colonial conferences plan as affording the startingpoint for a permanent Imperial Cabinet. (E. P. Dutton & Co., New York. \$6, net.)

Mr. Charles Whibley has provided this new edition George Bentinck of Disraeli's biography of Lord George Bentinck with a vigorous, indeed a forcible, introduction. It smacks of the campaign orator rather than of the essayist, passing from an adroit assault on Cobden and Peel and the principles they represented in the fiscal struggle of sixty years ago to a parallel between the protectionist leader of 1846 and the protectionist leader of to-day. The most thoroughgoing "tariff reformer" of modern England can find nothing to complain of in Mr. Whibley's eloquent flights, although the recent elections must convince him that the optimistic prediction with which the work closes is a trifle rash. From the historical standpoint, too, there is ample room for criticism. The sweeping statements common to campaign documents abound. We are told, for instance, that Cobden and Villiers "had little interest in the masses. They were the champions of the employers, and their end and aim was to reduce the wages of the workmen," and that Cobden "hated factory acts as bitterly as he hated trades unions." Comment on the book which has given occasion to this plea in behalf of the Chamberlain cause is unnecessary at this day. (E. P. Dutton & Co., New York. \$2, net.)

Napoleon's
Love Story

The Count de Soissons, who has translated this romance from the Polish of Waclaw Gasiorowski, points to its author as a "worthy champion of that art of novel-writing

which secured a world-wide renown to Sienkiewicz," and assures us that "he is a very able master of the historic romance, originated by Sir Walter Scott." Without being willing to indorse fully his high opinion of the youthful novelist-Gasiorowski is little more than thirty years old—we must say that " Napoleon's Love Story " has left a decidedly favorable impression on our mind. It is too long and treats of an unpleasant theme—the liaison between Napoleon and the beautiful Countess Walewska-but it is a strong piece of work, with passages of rare dramatic power and some fine characterizations. Gasiorowski, we are told, is an enthusiastic admirer of Napoleon, but the Napoleon of these pages is the reverse of admirable, and the presentation should go far to disenchant undiscriminating heroworshipers. A word of praise is due the translator, whose version is flexible and agreeable, preserving the unique individuality of the original. (E. P. Dutton & Co., New York. \$1.50.)

The Open Church for the Unchurched

The Rev. James E. McCulloch, of Nashwille Tennessee here

ville, Tennessee, here throws upon the problem of city evangelization the light of a great example. Under the leadership of the late Hugh Price Hughes the British Wesleyans have shown in London what can be done in American cities, whose churches are said to be twenty years behind the forward movement now well under way there. Where we have city mission chapels the great central halls of the British Wesleyans are their largest and most costly edifices, and thither the crowds throng. In these strategic points the "open" or "institutional" church has its home, its arsenal, its altruistic supply for needs which other parts of the social organism—the home, the school, the government-fail to supply. What is most to the point, the ablest church leaders are put in command. These methods are worthy, not of entire adoption, but of wise adaptation to American needs. This is an inspiring book. As Bishop Hendrix says in its Introduction, "it is a picture of the firing line." (The Fleming H. Revell Company, New York. \$1, net.)

The Ranch on the Ox-Hide

The author of this young people's story of frontier life is Captain Henry

Inman, whose volume on "The Old Santa Fé Trail" in a more systematic way but with immensely entertaining qualities revived the old days of pack trains, trappers, teamsters, adventurers, and Indian fighters. The same kind of material is here used in describing the hardships, perils, and sport of a group

of four boys and girls thirty years ago, and before the Indian, the buffalo, and the antelope had disappeared. (The Macmillan Company, New York. \$1.50.)

In this book Mr. W. H. The Reconstruction Mallock deals only with of Religious Belief three fundamental articles of religious faith-God, freedom of the will, and immortality. Concerning what is distinctive in Christianity he has nothing to say. The foes he attacks are materialism and determinism. His attempt is to show, first, that faith in all three of the fundamental articles named above is essential to the social organism, and, second, that faith in at least the first two is really implicit in the agnosticism which ignores and the materialism which denies them. This is not an original argument, but it is put by Mr. Mallock in an original way. His book would be a third better if it were a third shorter. It appears to us quite conclusive to any one who is patient to read it and open-minded to give it attention. Simple as they appear to be to the superficial thinker, materialism and determinism are both self-contradictory, and their self-contradictions are by Mr. Mallock effectively exposed, though the process of argumentation is sometimes needlessly elabo-

Dr. Martha Tarbell has Teachers' Guide produced a work for teachers of the International Sunday-School Lessons for 1906 which ranks with the best of its class. It would be difficult to excel it in the line which passes over all critical problems to illustrate and apply to pupils of all ages the teaching of the text as it stands. Aside from its immediate value for the current year, whose lessons are all upon the life of Christ, it has a permanent value for preachers in quest of "sermon-stuff." To these its copious selections from helpful writers and numerous apt anecdotes present a large quarry of illustrative material. (The Bobbs-Merrill Company, Indianapolis.)

rated and complex. (Harper & Brothers,

New York. \$1.75, net.)

The United States in the Twentieth Century

When M. Pierre Leroy-Beaulieu's work first appeared, The Outlook (October 29, 1904) de-

voted considerable space to an account of the scope and conclusions of the book, recognizing it as one of the most important volumes about the United States ever written by a foreign student and observer. The book has now been carefully and admirably translated into English by Mr. H. Addington Bruce, and will undoubtedly take its place as an informative and instructive survey of the industries, resources, and development of the

United States. The author is the son of the eminent economist Paul Leroy-Beaulieu, and has himself published more than one book dealing with economic and industrial topics. He furnishes for this translation an extremely interesting preface, in which his view as to one tendency in this country and the danger of that tendency is thus expressed: "Of the qualities that have co-operated to elevate them [the American people] so rapidly to such a commanding position, the most impressive is a great, a tireless energy. Now that the obstacles raised by nature have been overcome, now that the country is already so wealthy that the individual cannot always hope to see his efforts as richly compensated as was formerly the case, there is danger that this precious quality may be to some degree lost. It seems to me that the first care of the Americans should be to maintain it in all its integrity. Now, the essential condition to the development of energy is liberty. Every restriction on liberty, with however good a purpose, diminishes the sentiment of individual responsibility and initiative. Yet we often hear mooted in America as elsewhere measures which, under the pretext of correcting abuses, would immeasurably extend the State's sphere of action and reduce the liberty of the citizens." Equally interesting is his remark in regard to the future of our great trusts: "I am persuaded that I ought to

adhere to my original opinion that the majority of these unwieldy organizations will be unable to survive an acute and prolonged period of depression. I believe, to put it briefly, that the attempt to monopolize a great industry and to control prices is certain to fail unless it receive direct or indirect governmental aid. And I am convinced that an unduly high opinion has been entertained of the dangers as well as of the strength of the trusts, and of the part they have played in the development of American manufacture." (Funk & Wagnalls, New York. \$2, net.)

No impulse of natural feel-With ing encounters graver diffithe Sorrowing culty than a tactful ministration of sympathy in the home overshadowed by the wing of the death angel. To facilitate it this little book, edited by an experienced pastor, Dr. Frederick W. Palmer, of Auburn, New York, has improved in various ways upon manuals in common use. By its classification of Biblical selections according to their suitability for different circumstances, its prayers, and its choice "songs for faith and comfort," it offers "suggestions for the use of pastors, missionaries, and other visitors in the homes of sorrow," most profitable for the avoidance of monotony and formalism in the effort to discharge a sacred duty. (Fleming H. Revell Co., New York. 75c., net.)

Letters to The Outlook

MORMONISM

Of the letters sent us concerning Mr. Irving's article on "Some Aspects of Mormonism" we here print one entire letter and passages from a second in criticism, and one in approval. Mr. Irving stated quite as frankly as any of our correspondents the evils of the Mormon hierarchy. We cannot understand how his article could have been interpreted as a "defense of Mormonism." Nor do we find anything in the article to imply that "time will effect a natural cure of these evils." The difference between Mr. Irving and his critics seems to have been occasioned by the fact that he urges as a cure for those evils, not denunciation, but education.—The EDITORS.

The amazing defense of Mormonism by G. A. Irving in The Outlook of January 6, 1906, comes as a surprise to many, in view of the startling disclosures made in the trial of the case of Reed Smoot, United States Senator from Utah and Apostle of the Mor-

mon Church, before the Senate Committee of Privileges and Elections.

We must take exception to one premise upon which the article is based—that prejudice against the Mormons exists to a large degree because of the biased reports of Christian workers in Utah, concerning whom the writer says: "From the very nature of his work, and the attitude of suspicion and hostile criticism which he often assumes on engaging in it, he is often blinded to the good of Mormonism." An apparently much more extended acquaintance with Christian workers in Utah allows us to assert that in hundreds of addresses given in the East by such there has not yet been heard one word which has differentiated the average Mormon in his social instincts and his neighborly attitude from other citizens, while each speaker has fully recognized and publicly granted that where hierarchic command does not limit his activities the lay member of the Mormon Church is quite as ready to do the kindly deed and to establish friendly

relations as the man of any creed. In addition, it is without question a fact that many of the strongest opposers of Mormonism, and thus known in Utah where they have lived for years, and who have spoken through the East on this subject, have yet the most pleasant relations with scores of Mormons, and are respected and loved in Mormon as well as Gentile communities. This is so eminently true of numbers of the best known of anti-Mormon Christian workers as scarcely to need repeating. Though they strive to lead him from the hold of a Church the doctrines of which are so notoriously "at odds at many points with Christian doctrine and the highest instincts of religious truth," yet it is not the Mormon as an individual with whom these workers have any quarrel, but rather with that organization whose history has been one long story of conflict with the United States Government, which has again and again broken its pledges to that Government, and which seeks the domination of the State by the Church, claiming its right to the temporal as well as the spiritual control of every member.

Our country is founded upon the absolute separation of Church and State, yet the Mormon Church has placed denominational teaching in the public schools of Utah. "Outside of two or three larger towns, every public school in the State is, in all but name, a Church school." Owing to Gentile agitation following the disclosures on this point at Washington, orders were issued from Church headquarters that such teaching should cease, but Mr. Irving assures us that it continues unchecked. "'Have you given up your religious classes in the schoolhouse?' some weeks afterward I inquired of my Mormon neighbor. 'No, indeed,' said he, with a smile; 'it was never intended that we should.'" We are thus introduced to one of the marked features of the Mormon hierarchy—its duplicity, the public promulgation of orders to be quoted to tourists, to be published in Eastern papers, to mislead the unwary, but accompanied to the faithful by that underground information that informs him that these orders are for effect and not to be taken literally. From the acceptance of the manifesto of 1890 and the steps which finally led to Statehood, to the present, so full has Mormon history been of these examples that the initiated scan closely every order issued, to learn, if it may be, the inward meaning.

Church teaching has been continuously traitorous, and its logical result may be seen in one Mormon town, where last year the public observance of July Fourth was by proclamation of the Mayor set aside in favor of the celebration of July 24—a great Church

holiday; also in a Mormon town of southern Utah, where, on July 4, 1905, the flag was not hoisted on the public flagstaff until late in the afternoon, and was then placed at half-mast.

Hope has come to Utah in the overwhelming success at the polls last November of the new American party formed of those Gentiles and few Mormons who realized the deadening effect of the Church dominance in politics and the downward trend of civic life under its influence. The "Deseret News," official organ of the Mormon Church, published in Salt Lake City, while it does not definitely place the blame where it belongs, upon city officials under the control of the hierarchy, would nevertheless not agree with Mr. Irving, "Nowhere have I found personal safety more secure and property rights more respected," as it has repeatedly during the past few weeks set forth the dangers in the streets of Salt Lake City from thugs and the lack of safety provided by the police. This is, however, quite "another story," as many non-Mormon cities are equally unsafe after nightfall; but if the Church paper, corroborated by other Salt Lake City papers, is to be believed, that community will quite hold its own with the other cities as to robberies, hold-ups, gambling-houses, and brothels. Mr. Irving paints his picture with too flattering a brush.

We are further informed as to polygamy that, "so far as its practical bearing on life is concerned, it is fast becoming derelict." At the trial of Reed Smoot, President Smith, of the Mormon Church, testified that he had five wives, all of whom had borne him children since the manifesto of 1890 forbidding polygamy; a number of the Twelve Apostles, seven, we believe, likewise testified that they were living in polygamous relations with two or more wives, while other high officials of the Church testified to similar conditions in their lives. All of these men, in answer to the questions of the members of the investigating committee, acknowledged that they knew they were living in open defiance of the laws of the State and of the publicly promulgated manifesto of the Church, yet President Smith, a lawbreaker by his own sworn testimony, is looked upon by Mormons as the "mouthpiece of God, a prophet, seer, and revelator." Further, in April, 1905, at the time of the Church conference and after the above disclosures had been made, these men were confirmed in authority by the people. "Of the eight thousand people present, quite half fully understood that certain of those they were called upon to confirm, judged by human or divine laws or under the rules of their own organization, were absolutely unworthy; but all the vast assembly, with only two exceptions, voted to confirm them in their positions."

Is polygamy a "derelict" among a people who deliberately sanction it in the leaders sworn to uphold Church laws, some of whom have taken new wives since Statehood? It is in Utah a notorious fact that younger men desirous of achieving ecclesiastical eminence have become polygamists since Statehood. "Many young women are plural wives to-day who were not fifteen years old at the time the pledge [to abstain from polygamy] was given."

Let us quote in closing from the protest adopted by the American party at its inception on March 14, 1904:

The law-abiding people of Utah have read with amazement, indignation, and disgust the declaration of President Joseph F. Smith, of the Mormon Church [at Washington], that they are broad-minded enough to consent to the shocking violations of law and public decency which he confesses to have committed.

We protest that we are not deserving of this sort of praise; on the contrary, we most emphatically repudiate and repel the statement, which in fact is an allegation that we, knowing of his defiant lawlessness, are accessories to his crime.

We declare, on the contrary, that he and the other polygamists have surrounded themselves with an impenetrable wall of secrecy in their perpetration of the misdeeds testified to, have systematically suppressed the record of births required by law, and it has been impossible, through court process or otherwise, to obtain any exact knowledge of what was being done, much less legal evidence of the offenses; that the public sentiment of the law-abiding people here has at all times been zealous for the punishment of polygamy and polygamous practices, as well as of other crimes.

It has therefore been impossible to know what was being done in this regard, notwithstanding strong suspicion of the facts entertained by many persons. The weil has been lifted in part, for the first time, in the testimony that has just been given by the Church leaders in Washington; and nowhere in the whole country did this testimony occasion so much astonishment and humiliation as in Utah. The investigation thus far has been so fruitful that we call for its rigid continuance, confident that further disclosures equally startling may be expected, as there are certainly deeper depths than have yet been sounded.

Thousands of the leading citizens of Utah indorsed this protest—men and women who know conditions by daily contact therewith, and at the polls vindicated their signatures. In the face of their solemn declarations, will the American people be lulled into fancied security that time will effect a natural cure of these evils?

M. KATHARINE BENNETT,
Corresponding Secretary Interdenominational Council of Women.

As a reader for many years of your magazine, I feel that I am privileged in its interest, and especially that of the country at large, to express my deep regret and surprise that

you should have given circulation and prominence to the Mormon article in the January issue. Surely the recent developments in the Smoot investigation have revealed beyond a doubt the spirit, method, and menace of a system born of fraud, nurtured in deception, and perfected in intrigue!

At the Smoot trial last winter the writer heard Senator Burrows put this question to the custodian of the Marriage Records in the Mormon Temple: "Do you mean to ten me that if the Senate of the United States were to demand those records of you that you would refuse to give them up, if ordered you do by the President of the Mormon Church?" "I could not give them up without authority from the President of the Church," was the prompt reply. Nor did he.

Just here lies the evil of Mormonism, in this belief of its disciples that the authority of the Church is greater and more sacred than that of the State. Upon this claim we base our demand for a legislative, restrictionary power, a Constitutional Amendment which will compel a recognition of Governmental authority and jurisdiction, heretofore utterly and successfully ignored, and that too, with the full knowledge and hearty indorsement of the "Big Twelve," who, Mr. Irving claims, are "the whole thing in Utah."

It is the public ignorance of the real facts in the Mormon problem—procurable to any who honestly desire to know and have the welfare of the country at heart—this apathetic endurance of appalling conditions, which a united public sentiment could speedily overthrow, that is responsible for the growth and vaunted prosperity of the foulest system which ever endangered a nation's safety and honor.

At the request of the President of the Interdenominational Council of Women, and representing also the National Woman's Christian Temperance Union, as lecturer in their joint campaign for an Anti-Polygamy Amendment to our National Constitution, I voice the general, aye universal, protest of the Christian womanhood of the Nation. On their behalf I ask that, in fairness to them and the cause they represent, you generously give publicity to this appeal.

(Mrs.) MARIA C. WEED.

New York City.

I desire to express appreciation of the article, "Some Aspects of Mormonism," by Mr. Irving, appearing in your January 6 number. Many articles are written concerning Mormonism by writers having plainly but a superficial knowledge of the subject matter, and usually from a prejudiced view-point. Mr. Irving comes nearer reciting the situa-

tion as it is known to those intimate with Utah and her people than many who have essayed to treat the subject. A native of New York, for ten years last past resident in Salt Lake, and with a most pronounced opinion regarding the iniquities of polygamy, I am constrained to say that much injustice has been done the masses of the Mormon people in many of the articles condemnatory of them and their religion heretofore written. To my mind, the solution of the question, as Herbert Spencer might put it, in line with his "Synthetic Philosophy," is evolutioni.e., education, not attack—and it is a singular fact that now where Mormons apostatize they seldom if ever embrace another faith. The one man, to the mind of many of us in Utah, who has done more enduring good for the Mormon people than any other, and who seems to have a more comprehensive knowledge of the practical way of handling conditions existent, is the Hon. George Foster Peabody, the New York financier philanthropist, who, in pursuing his altruistic ideas, has accomplished great good in Utah. His large beneficences to the Young Men's Christian Association in Salt Lake have caused a \$200.-000 building to rise, with an Association now having 1,500 members, hundreds Mormon. His inauguration of the traveling library, with dozens of cases of books, which are sent to the most remote parts of Mormon Utah, together with donations to our hospitals throughout the State, and other acts of similar kind, have proven of more real value in furthering the principles sought to be inculcated by non-Mormons than all the antagonistic articles ever written. Charity, patience, and education will prove the panacea for C. P. OVERFIELD. Mormonism.

Salt Lake City.

"THE MODERN CONCEPTION OF FOREIGN MISSIONS"

Dr. Gulick's article with the above title in The Outlook of November 4 has doubtless been read by many, as it has by myself, with deep interest. The article is timely; it is valuable. Does it perhaps invite, not criticism, but the addition of a further thought or two from one who, in the experience of a somewhat prolonged missionary life, has passed from what Dr. Gulick terms the "individualistic" into the "socialistic" conception of what foreign missions aim at and work towards?

1. May it not help us to look less at any theory of humanity, individualistic, socialistic, or other, and observe, the rather, what has been and what now is the practical form of work in the efforts of Christ's disciples to

fulfill our Lord's last command? If we do this, will not the query at once arise whether the conception Dr. Gulick commends can rightly be termed "modern"? The missionary work of the apostolic and of the postapostolic age-and there was an abundance of it-aimed, and that with marked success, at saving men as they were found, in all races, all classes, and also at elevating, purifying, Christianizing the whole social order within and without the Roman Empire. So, later on, the process of the evangelization of the various peoples of Europe, from the time when the first Gregory sent the monk Augustine to England at the end of the sixth century till the conversion of the Bulgarians in the tenth, was that of using the net rather than the hook. The aim was first to convince rulers and leaders of the people of the superior claims of Christianity, and through them to make Christian, and then to instruct in detail the people of the tribes and races subject to the ruler's authority. This method was carried to its extreme length by Charle-

Speaking generally, and it must be confessed somewhat inaccurately, modern missions are about a century old. There is no doubt that the great awakening, a century ago, among Christians of the West, to the duty of fulfilling our Lord's last command, resulted in missionary efforts which showed their results chiefly in individual conversions. "Soul-saving" was the watchword. It is equally true that a result, and a regrettable result, especially in the lower ranks of human life and society amid ancient Oriental civilizations, was often to isolate the converts from their people and render them dependent on their foreign benefactors. If those first missionaries, of saintly and illustrious memory, could now be challenged to answer for the method they adopted, would they not, in turn, challenge us to tell them what other course was then possible? What was the condition of India or China, not a century but half a century ago? China was then literally closed to foreign residents except in well-defined quarters of a few coast cities. India as well as China was closed and sealed and barred against foreign religious and social influence. Human life was thickly incrusted in customs ages old; Eastern civilizations run back into hoary antiquity. Orientals treated with contemptuous superiority religious and social innovations coming from the West. Even fifty years ago it required all the tact and perseverance of Christians fired with a passion for souls for whom Christ died, to get a hearing from one person here and from another there, among Oriental peoples. It is no wonder

that genuine converts were few and that little impression was made upon society. Yet the aim of those pioneer missionaries was to do just what the missionary of to-day can do and is doing. What we see is normal growth and development. We see the fulfillment of our Lord's parable of leaven. We may be grateful, but should not congratulate ourselves, over the fact that we are working nearer to the realization of the missionary ideal cherished by our predecessors. They saw only the rising of the morning star which has already ushered in our day.

We see that the stupendous enterprise we are working at means a spiritual uplifting and remolding of human life and society in all lands, a spiritual regeneration of men, individually and socially, intellectually, morally, politically. It is an enterprise compared with which Brooklyn bridges, Alpine tunnels, gigantic business trusts, are all child's play. But who can measure the responsibility which this knowledge imposes on us? The missionary work in its true idea, in its wide scope, in its stupendous plan and object, is that which makes life worthy of the sons of God, worthy of the brothers of the man of Nazareth, Gethsemane, and Calvary. Read through the Gospel records and observe that Jesus himself never had a shadow of doubt concerning the full accomplishment, in its time, of all for which he came to our world. Is he not seeing of the travail of his soul? Will he not, by and by, be fully satisfied? Recall the zeal of our predecessors in the translation and the widest possible circulation of the Bible, in the establishment of schools, in heralding the glad tidings. Let us rejoice that already many islands of the Pacific, and that at least one large people in the heart of Africa, have become Christian. And what are we going to do with the problem offered us in the Far East of a nation in some respects more Christian than some "Christian" nations, which is not yet Christian in name?

Measured by one human life, the progress of the kingdom of God in our world seems slow; measured by the eternal years into which that kingdom merges, we can both patiently wait its growth in time, and more courageously strive, during our day of labor,

to hasten our Lord's triumph, though it be but by one little hour.

GEORGE F. HERRICK.

Constantinople.

A CLEARING-HOUSE FOR BOYS' WORK

The very interesting articles by Ernest H. Abbott upon the work of the Young Men's Christian Association, and his careful criticism of its methods, make it worth while to call attention to one illustration of Association work which merits notice because it shows a readiness to adapt itself to local needs and a willingness to come into closest relationship to the churches.

In Norfolk County, Massachusetts, some three years ago, a county work was instituted with the purpose of giving to small towns unable to support an Association, some of the benefits of the Young Men's Christian Association. A man was put into the field, and it soon developed that the greatest need was for some effective work with boys. A society for boys, known as the Phi Alpha Pi, was planned and organized in several towns. It was found that the pastors of the churches were greatly interested in this work, and therefore several of the local societies were organized as boys' clubs connected with churches.

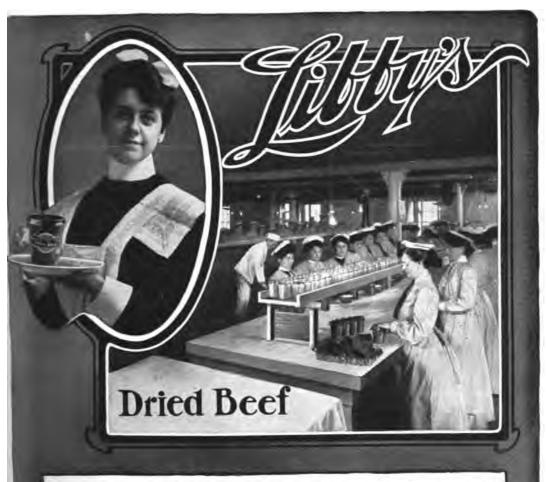

The result is that to-day most of the boys' clubs in Norfolk County, watched over and cared for by the County Secretary of the Young Men's Christian Association, are connected with various churches. The Young Men's Christian Association's Secretary has really taken the position of expert supervisor of boys' work in the churches of Norfolk County. He plans with the pastors and attends the meetings of the different boys' clubs, and his office in Boston is rapidly becoming a sort of clearing-house for the boys' work that is being done in the churches.

This is a valuable and efficient form of co-operation, and is suggestive of other ways in which the church and outside organizations may get together for the common good.

A GREAT BARGAIN IN BOOKS!

A STANDARD BIBLE REFERENCE LIBRARY OF TWELVE LARGE HANDSOME VOLUMES CONTAINING 9834 PAGES

ONE OUARTER ORIGINAL

EVERY BOOK NEWLY MADE

ORIGINAL PRICE, \$44.50; NOW ONLY \$11.00; SAVING \$33.50

Jamieson, Fausset, and Brown's Bible Commentary (2 Vols.)

A complete commentary—critical, explanatory, and practical—on the Old and New Testaments. Consists of notes that are concise, learned, and easily understood, that elucidate the difficult passages of Scripture. 1380 pages. Former price, \$9.00.

Fausset's Critical and Expository Bible Cyclopedia

This great work is the result of seven years of labor by the author, contains three thousand seven hundred articles, and makes a complete and perfect Bible Cyclopedia. 750 three-column pages, 600 illustrations. Regular price, \$5.00.

Conybeare & Hewson's Life and Episties of St. Paul

There is no work that will compare with this in giving a lifelike picture of the great apostle and the work which he did. 1014 large octavo pages, many fine illustrations, maps, charts, etc. Formerly sold for \$4.50.

Cruden's Complete Concordance

Scripture is the best interpreter of Scripture, and, next to the Bible, no volume is of greater value to the Bible student than Cruden's Concordance. 750 pages. Former price, \$21.80.

Kitto's Illustrated History of the Bible

No modern writer has done more to clothe with a fresh and living interest the main personages and incidents in Bible history than IOHN KITTO in this magnificent work. Over 100,000 copies have been sold. 735 double-column pages, 220 illustrations. Former price,

Edersheim's Life and Times of Jesus the Messlah (2 Vols.)

Gives a full account of the society, life and development—intellectual and religious—in Palestine, to serve as a frame and background for the picture of Christ. A life of the Saviour which is critical as wel as biblical. 1524 pages. Former price, \$6.00. This is the authorized American edition.

Sanford's Concise Cyclopedia of Religious Knowledge

A storehouse of information regarding Church History. Bible History, Names. Places. Customs, Doctrines, Creeds. Denominations, The Early Church, The Story of the Reformation, the various Young People's Societies, Theologians, Scholars, Cathedrals, Churches, etc. 985 pages. beautifully illustrated. Former price, \$3.50.

The Complete Works of Flavius Josephus

In this great work is contained the History and Antiquities of the Jews: Destruction of Jerusalem by the Romans; Dissertations concerning Jesus Christ, John the Baptist, James the Just, and the sacrifices of Isaac. Nearly 1,000 pages. Former price, \$4.00.

Smith's Dictionary of the Bible

An indispensable aid to Ministers, Teachers, Families, Sunday-school Superintendents, and Bible readers generally. 1024 pages, finely illustrated. Former price, \$4.50.

Three Thousand Selected Quotations

BY JOSIAH GILBERT.
Introduction by Chas. S. Robinson, D. D.
Burning words of brilliant writers from the literature of all ages, with complete index of authors and subjects. 681 pages. Former price, \$2.00.

Hand Embroidered Linen

Waist Patterns

We have just opened and are now showing a very choice assortment of fine Embroidered Waist Patterns of French and Irish manufacture. Each pattern consists of about three yards of material, with eyelet or solid embroidery in beautiful floral designs; collars and cuffs are embroidered to match.

Prices range, \$2.50, 3.00, 4.00, 5.00, 7.50, 8.50, 10.50, and up to 35.00 each.

Embroidered Robes

These are of the same high grade and style as the Waist Patterns. They are embroidered on fine sheer Linen. Most of the Skirts are cut circular, but a few show flounce effects.

Prices, \$10.00, 12.00, 17.50, 20.00, 30.00, and up to 65.00.

Each pattern contains sufficient material to make an entire suit.

EVELAND

TEA and COFFEE

That Need No Apology

How many hostesses there are who feel it absolutely necessary to apologize to their guests for their tea and coffee. This may be the fault of necessity, economy, or what is far more likely, unreliable grocers. In the prices of tea and coffee, sold in the usual way, the profits of jobber and trade are included, so that the purchaser frequently pays a high price for an indifferent article rather than a fair price for a good one.

For 24 years as importers, manufacturers, jobbers, and retailers combined, we have sold in our 47 stores the best teas and coffees at wholesale prices. The same policy has now been adopted in our new Mail Order Department.

KING CHOP Tea (35 cents per pound), unexcelled in its purity, delicate aroma, and charm of

DUCHESS BLEND Coffee (25 cents per pound). made of most carefully selected Java and Mocha.

Sample trial packages—2 ounce package of King Chop Tea and a 3 ounce package of Duchess Blend Coffee—will be gladly sent you upon receipt of ten cents to cover partial cost. When ordering, kindly mention variety of tea preferred—whether Formosa, Japan, Ceylon, or mixed, etc.; also whether coffee is desired ground or whole.

The Outlook

SATURDAY, FEBRUARY 10, 1906

0

The failure on the Strike Prospects part of the Interin the Coal Industry State Joint Conferences of coal operators and mine workers in session at Indianapolis the past several weeks to come to an agreement as to the wages and conditions of employment which are to prevail in the coal industry of many of the States for the scale year following April 1 presents a very serious situation. There still remains a possibility, though slight, that the amicable relations which have existed for the past eight years between the employees and employers in the more important soft-coal fields of the Middle West will not be completely severed, and the country in consequence plunged into a widespread industrial struggle; but from present indications the actual prospect is contrary to the hope expressed. It is true that in 1904 the Inter-State Joint Conference of the central competitive territory adjourned its first meeting without an agreement, presenting somewhat the same situation as the country confronts at present, only to reconvene later and agree upon the terms of a new contract before the old one expired—not, however, before a vote of the mine employees in the States affected was taken upon the issue. Then industrial conditions were regarded by the miners' officials as unpromising, and in consequence, with the indorsement of the members of the union, they accepted a reduction in wages of five and onehalf per cent. They claim now that they did so with the understanding that this reduction was to be restored at the following Conference. As the agreement embodying the reduction was for two years, the Conference of the past several weeks is the first held since the wage reduction was accepted. Not only did the representatives of the mine workers demand the restoration of this five and

one-half per cent. reduction of two years ago, but they asked for an additional increase of seven per cent., or a total increase in wages for the coming year over those paid the past year of twelve and Their demands also one-half per cent. included the prohibition of the labor of boys under sixteen years of age in and around the mines, an eight-hour day where not now in force, and other concessions too technical for mention here. Moreover, most of them are unimportant, inasmuch as all the demands of the mine workers were lost sight of in the debate over the demand for an increase Around this principal dein wages. mand centered practically the entire discussion of the Conference. The operators refused emphatically to grant any demand which carried with it an increase in wages, offering in opposition to the miners' demands that the present wage scale be continued for another year. With these differences clearly marked. the Inter-State Joint Conference of the central competitive fields has adjourned without any agreement, and unless something definite towards this end is accomplished before April 1, the mine workers of western Pennsylvania, Ohio, Indiana, and Illinois will refuse to sell their labor at the present price, and as a result will quit work on that day, thus suspending mining operations throughout these dis-The situation is even more seritricts. The Inter-State Joint Conference of what is known as the Southwest territory (Missouri, Kansas, Arkansas, Indian Territory, and Texas), meeting in Indianapolis at the same time, has also adjourned without an agreement being entered into. Thus, in nine States, employing over 225,000 mine workers, of which number approximately 175,000 are paid-up members of the United Mine Workers of America, a suspension of soft-coal mining is probable on April 1.

Add to this number the 75,000 mine workers in six other States in which the State agreement contract also expires on the same date, and we have a total of more than 300,000 soft-coal mine employees who may suspend coal production at the end of next month in fifteen of the more important mining States. Nor does this number include the 150,000 anthracite mine employees whose present arrangement under the award of the Anthracite Coal Strike Commission terminates on March 31. For the present the situation in the hard-coal fields is in the hands of the conference of operators and mine workers which has been called for February 15.

(2)

Thus is presented an Where the industrial situation Responsibility Lies in the coal fields of the United States never before confronted in this country. Something analogous to it, although on a much smaller scale, was experienced during the several months preceding the great strike of the mine workers in the central competitive and adjoining soft-coal fields inaugurated on July 4, 1897. On that date more than 100,000 coal-mine employees in eleven States suspended mining operations for eight weeks, affecting seriously the coal production of western Pennsylvania, West Virginia, Ohio, Indiana, Illinois, and a part of the anthracite region of Pennsylvania. At that time the actual paid-up membership of the United Mine Workers of America, which organization directed the strike, did not reach 10,000, whereas to-day it exceeds 300,000. At the inauguration of the 1897 strike the treasury of the union was practically empty; to-day the organization has at its immediate command a defense fund amounting to nearly \$3,000,000. The 1897 strike was one of the consequences flowing out of the breakdown several years previous of the Inter-State Joint Conference, but it succeeded in restoring this industrial machinery to the central competitive territory. Upon its successful operation since then is to be placed the credit for the continuance of industrial peace in the coal industry of those States, for no strike of any serious propor-

tions has taken place since 1897 in any of the districts governed by the Inter-State Joint Conference. We believe the public welfare demands emphatically that every possible means be resorted to by those having in charge the continuance of this industrial machinery before they permit the present crisis to merge into a still greater one by its breakdown. The consequences are so serious and the responsibility resting upon the leaders of the operators and of the mine workers is so great that a strict accountability will be demanded by the public of those who force upon it, or rather do not prevent it from experiencing, the threatened industrial war. That responsibility cannot be laid upon either party alone. For to affirm that the operators alone are responsible is to insist that they must always pay whatever the miners ask, and to affirm that the miners alone are responsible is to insist that they must always take whatever the operators Neither proposition is true. In a case of this kind, in which no vital principle is involved, but only a question of the proper sharing of the profits of an industry between those engaged in it, where agreement is not possible, arbitration should be resorted to. It is intolerable that the general public should be made to suffer a coal famine because the two partners engaged in the work of coal-mining quarrel over their division of the profits.

Judge Holdom, of a A Labor Union Chicago court, has fined in Contempt a Typographical Union for contempt of court, and sentenced two of its members to both fine and imprisonment. A request for jury trial was denied on the ground that "the Court has no doubt about the facts." The question whether an unorganized body (for the Typographical Union is not incorporated) can be punished for contempt because of the conduct of its officials, not specifically described by the body as such, is not even discussed by the Judge. It is a general principle that no person, whether corporate or individual, can be held guilty of a criminal act unless it is brought home to him; and it appears to us that the Judge in this case should either have

shown that the Union did explicitly authorize the acts of its officers which are adjudged to be in contempt of the injunction granted by the Court, or else he should have pointed out under what conditions a partnership—for as such an unincorporated union must be regarded by the law—can be held criminally responsible for the acts of an official not specifically authorized by the body of which he is an officer. In the case of Franklin Union No. 4 vs. The People, the union was incorporated, and there was evidence showing corporate acts of the union in violation of the injunction. In the present case the union was not incorporated, and we fail to discover in the Judge's opinion any indication of any evidence of organic acts by the union in violation of the injunction granted. The Outlook is of the opinion that no such body should be held guilty of contempt for the illegal conduct of its officers without explicit evidence that this conduct was authorized by the body; and it is also of opinion that in all proceedings for contempt for acts not done in the presence of the court, the accused ought to be entitled by law to demand a jury trial prior to the infliction of any penalty as for a crime. The same judge ought not to be permitted to issue the injunction, try the accused, adjudge him guilty, and determine the sentence.

●

The prediction of Kansas Oil-Producers' The Outlook sev-Problem eral months ago that the battle of Kansas against the Standard Oil trust was not won when it adopted drastic legislation is being amply fulfilled in the struggle of the independent refineries for business. Eight such institutions have been established, and five of them are in operation. output of refined oil has the advantage of the low freight rates and absence of discrimination, both resulting from the legislation of last winter. These alone, however, as the independent refiners are finding out, do not make large profits. In the first place, the Standard Oil Company quite naturally receives the same rates and sells at the same price, making the retail disposition of inde-

pendent oil to a considerable extent the result of State pride in its new industries. But Kansas has only a million and a half people; in every town of importance the Standard has a thoroughly equipped system of selling by wagons, and the market left for the independents is by no means sufficient for the upbuilding of a profitable business. When the adjoining States and Territories are sought, what happens? An address just issued by the independent refiners and sent to Commissioner Garfield says that the alliance between the railroads and the Standard, together with the latter's extensive network of pipe-lines, practically limits them to the State boundaries. prove this they give these instances: Refined oil can be shipped from Chanute, Kansas, to Weber, Kansas, 254 miles, for 10½ cents per 100 pounds; to ship it seven miles farther on the same road, to Superior, Nebraska, changes the rate to 30 cents. There is no change of routing, of cars, or of road, yet the rate is trebled. From Chanute to Kiowa, Kansas, 181 miles, the rate is 9 cents; from Chanute to Alva, Oklahoma, 199 miles, it is 35 cents. The Kansas rates are the result of State legislation, but of course are not operative outside the State lines. "We are hemmed in on all sides." say the refiners; "like prison guards, the railroads and the Standard Oil Company lurk on the borders of the State, gun in hand, ready to call a halt on any man who has the temerity to try to ship his oil, either crude or refined, outside the borders of the State. If we are going to have any independent competition in petroleum worthy the name, we must have a wider market than the State of Kansas."

(4)

The Demand for Federal Aid

Following this address came a meeting of oil-producers at Kansas City to consider ways and means of selling crude oil. The product of the Kansas-Indian Territory field is now over 60,000 barrels a day; the independent refineries take 3,000 barrels; the Standard is buying about 35,000 barrels a day, and already has more than 10,000,000 barrels stored in the territory covered by the conference. Since the attack by the Missouri

authorities on its organization in that State it has stopped work on a second pipe-line to Whiting, Indiana, from which the producers hoped relief. Oil prices, when the product can be sold at all, are practically the same as last spring, approximately 50 cents a barrel. Under these conditions it is evident that the owner of an oil well or refinery has no flattering prospect, and it is difficult to see how Kansas can add to its statutes in such way as to help matters. Naturally, the producers and refiners turn to the Federal authorities as their only refuge—for they refuse to believe the Standard's excuse that over-production has caused the low prices of oil. Up to this time the Standard has been little affected financially by the Kansas agitation. It has filled its immense tanks with oil at the lowest price ever known in the field, barely enough to pay for pumping it to the surface, and has reduced its cost to Kansas consumers (who are the only ones benefited) by barely the amount of the lessened freight. It has, however, been greatly the loser through public disapproval, and the Kansas strife has set other commonwealths so vigorous an example that, even if the Government does not take drastic action, enough States may join the movement to extend the market of both refined and crude oil to the extent necessary for permanent and satisfactory profit. This is the hope of the producers of the Western field, and they are waiting eagerly for Commissioner Garfield's promised report on the oil industry as a working basis and as an impetus toward effective legislation elsewhere. The facts emphasize the truth that the railroads can make or mar communities and even States as well as individuals, and that industrial liberty depends on some far more effective regulation of freight rates than present laws afford.

@

Reform Measures in Pennsylvania erno

The reform legislation made possible by Governor Pennypacker's

call for a special session of the Legislature is in various stages of progress. The repeal of the notorious Ripper Bill has been finally passed and approved by the Governor, and so one bit of iniquitous work of the regular session of 1905 has been undone. This bill transferred the power to appoint the Director of Public Safety and the Director of Public Works from the Mayor to the Council. By its repeal the scandal of divided responsibility has been put to an The personal registration bill has been reported out of committee practically as introduced by Mr. Sheatz, who represents the election reform element on the floor of the House. The present prospects indicate that the bill, which is a comprehensive and satisfactory one, will pass. The same forces have prepared and introduced a uniform primary bill (also introduced by Mr. Sheatz), providing for the holding of the primaries of all parties on the same day and under the supervision of the regular election officers. The ballot is furnished by the State, but each elector must ask for the ticket he wishes to vote, and, if challenged, must declare the party he expects to support at the next election. A very satisfactory civil service bill applying to Philadelphia has been introduced at Mayor Weaver's request. In a forceful speech before the legislative committee having the matter in charge Mayor Weaver declared:

The power which has heretofore been exercised by the Mayor, or those behind the Mayor, has made it possible to build up a great big machine, whose power was not confined to the city of Philadelphia. It is that power that this bill should take away from the Mayor. . . . I think the only way to apply the merit system is to give the Mayor absolute power to establish an absolutely independent Civil Service Commission. As far as I am concerned, I do not care who shall appoint the commissioners, or how they shall serve. I do not care whether this bill is to be operated under me or the next Mayor. I do want a merit system established in Philadelphia that will give every department the best service that can be obtained, absolutely regardless of politics. . . You talk about having three names certified. What would you think of one thousand men on the eligible list, as was the old custom, and not one being able to be appointed because some other man had the indorsement of forty politicians because he had performed some political service for a political boss, who did not care whether the city of Philadelphia got good service or not?

The prosecution of ballot-box frauds in Philadelphia continues. Last week three

election officers in the Twenty-sixth Ward were convicted of stealing the regular ballot-box and substituting for it The Commonone stuffed to order. wealth proved that the substituted box was stuffed with ballots which had been previously marked and tied up in packages of ten. The announcement that 195 ballots had been cast was a cue to those in the other room to place that number in the second box. In their haste, however, the conspirators threw in one package too many, making 205 instead of 195. A set of officials from a Fifteenth Ward Division were convicted for falsifying the count at the February, 1905, election. The conviction of these men indicates that the changed frame of mind of the people of Philadelphia on this subject continues.

In Democratic Sen-**Treaties** atorial caucus last Not Party Measures week Senator Patterson, of Colorado, resenting an attempt to enforce party discipline in opposition to the San Domingo treaty, declared that never before had action on a treaty been made a question of party consideration. This is certainly in accord with reason and justice, and we have not seen any allegation that as to actual historical practice Senator Patterson was in error. The reply made by Senator Culberson avoided entirely the principle involved and attempted to make a special and exceptional case of the San Domingo matter, by asking if there had ever been known "a treaty which departed so far, not only from the tenets of the party, but from the traditions of the country, and one which had been negotiated in such an extraordinary way." It cannot be too positively asserted that international peace and friendly relations must not be endangered by dealing with treaty proposals and obligations as fit subjects for factional, partisan fights in caucus or on the floor of Congress. In the Senate itself Senator Patterson had already declared openly that he was in favor of the President's policy as to San Domingo. Senator Morgan had given a similar intimation, and other Democratic Senators were known to have the like inclination. The caucus was an attempt to bind al! Democratic Senators by the two-thirds vote adopted as an authoritative caucus method by the party in the Senate two or three years ago. This was carried through; with only four negative votes the caucus formally resolved that it was the duty of every Democratic Senator to vote against ratification. Later on Senator Patterson introduced a resolution in the Senate declaring that the action of the Democratic caucus, in dictating to Senators how they should vote on the San Domingo treaty, was a plain violation of the spirit and intent of the Constitution of the United States. It remains to be seen whether the five Democratic votes necessary, according to the general estimate, to insure the ratification will be cast regardless of caucus tyranny. Press discussion seems to foreshadow the success of the treaty; and Secretary Root's thorough exposition of Domingan complications and of the need of prompt action, before the Senate's Foreign Relations Committee last week, made a decided impression.——We are glad to note that the bill to preserve Niagara Falls by joining with Canada in fixing practical measures of restraint has been favorably reported to the House, and that Mr. Lodge's bill for improvement of the consular service has passed the Senate—a measure already characterized in The Outlook as acceptable only on the "half-loaf" principle, and one that might well be improved in the House with even the faint hope that the Senate might in conference accept such betterment.

❸

On more than one occasion Reprisal, the American Government Not Revision has irritated the rest of the world by the establishment of extreme tariffs. America has now a chance to know how it feels. On March 1 the new German high tariff goes into effect. Under its provisions there is an important increase in the rates on various products, notably breadstuffs, for which we have hitherto found a large market in Germany. Exports of manufactures to Germany will also be affected-in the

growing shoe trade, for instance, the present rates are to be doubled and trebled. By the new tariff, however, minimum rates—which would largely continue our trade on its present basis—are offered to nations giving similar favors. The concessions offered by the Dingley tariff do not, of course, answer for such "similar favors." The German Government, therefore, has been hoping that a treaty of reciprocity might be established between it and the American Government. Concerning this Prince von Bülow, the Imperial Chancellor, said recently:

We have, naturally, a lively interest to reach a new agreement with the United States, and this wish corresponds not only with the friendly political relations of the two peoples, but also with the economic needs of both. Of course we wish in our new agreement with the United States to maintain the same points of view as those that controlled us in recasting our general commercial relationships and in the new commercial treaties already negotiated. We have, accordingly, drawn our proposals after a careful examination of the German interests affected. Our proposition will, we think, be quite within practicable limits, and certainly we shall approach the American Government with no requests that would injure the vital features of the American economic organism.

The Chancellor's view as to the means for bringing the two nations together in a new trade agreement is that ten tariff experts on either side shall meet for a frank exchange of friendly explanations. It is, of course, always possible to recognize contrary views when the general advantages of real reciprocity are kept in mind. Instead of this, what is proposed by the leaders in Congress? An increase of twenty-five per cent. over the Dingley schedules is to be assessed on imports from every country which fails to give to American products mostfavored-nation treatment, and a duty of twenty-five per cent. is to be imposed on all imports now on the free list when coming from countries which fail to give their lowest duties to the United States. This is the negation of reciprocity and revision. It is reprisal.

German
State-Owned Railways

The advantages and disadvantages of government ownership of railways as exemplified in Germany are set forth in a popular.

The advantages much taken from the taxes needed to pay Government expenses. The traveler helps pay the taxes, and the contribution even from foreign travelers is no inconsiderable amount. It is certain that

and interesting way by Mr. Charles Edward Russell in the current number of "Everybody's Magazine." In point of speed American railways are undoubtedly superior, and there is a great deal about the military discipline and excessive formality and rigidness of system in the German management that would seem irksome and absurd to Americans. A most amusing pen-picture, for instance, is given by Mr. Russell of the pompous station-master of "Bomburg-Homburg," with his magnificent uniform and grandiose supervision of the departure of a train. But in the essentials of comfort. cheapness, and convenience there is much to praise in the German roads. Mr. Russell says, "As nothing need be scrimped or stolen to make up dividends on watered stock and fraudulent bonds, the outfit is uniformly good, the roadbeds and track are in excellent condition, and the stations great roomy places, often of elaborate and handsome design." The trains are seldom late, and accidents are almost unknown. Russell asserts that although the German roads carry nine hundred million passengers a year, almost none meet with accidents, and that in America more people are killed in a week by the railways than in Germany in a year. The cheapness of passenger rates may be judged from the fact that there are fourth-class cars in which the peasantry may travel at the rate of less than a cent a mile. ing-car compartment with two berths closed off by itself, from Berlin to Frankfort, costs only \$2.50. There are liberal reductions for round trips, circular tours, and workmen's tickets. Private ownership of railways in Germany has almost passed away since 1871, when the first experiment in this direction was made. To-day twenty-nine out of every thirty-two miles of railway in Germany are owned by Government. Moreover, the business is made to pay. It is computed that the net annual profits of all State-owned railways for ten years have been between This is just so five and six per cent. much taken from the taxes needed to pay The traveler Government expenses. helps pay the taxes, and the contribution even from foreign travelers is no incon-

Germany in acquiring railways was not actuated by the desire of putting into practice any theory of State Socialism, but by the wish to get money to help pay her enormous military and other Government charges. Moreover, as Mr. Russell puts it, "The Government woke up in 1871 to recognize two facts: first, that whoever owns a country's transportation service owns the country; and, second, that it needed the national highway for national use." Prussia took the lead, and at the outset all the objections advanced by opponents of the idea in America were strenuously urged—that it would be a wrongful interference with private rights, that the vested interests of private companies could not be ignored nor purchased cheaply, that widows and orphans who owned railway stock and bonds would suffer. According to the account given by Mr. Russell, all this was overcome by one man—a " man with iron will, unbeatable and unturnable, who kept hammering away until he got what he wanted." Albert von Maybach, of the Prussian Ministry, "went quietly into the stock market and bought the control of one or two railroads. On these he instantly slashed all rates and reached out for all the business." brought the private companies to terms one by one, and a fair system of compensation was carried out. At present an Imperial Railway Department at Berlin harmonizes and co-ordinates the work of the different roads and enforces uniformity of method and fairness of charges-just as our Inter-State Commerce Commission should do if it had the power. Freight rates are probably a little higher than in America, but the classification is simple, the rates are the same to everybody, and are not changed arbitrarily or through favoritism. quote once more from Mr. Russell's conclusions: "So far as any outsider can discover, there is no grafting, and assuredly there is no stock juggling, bond juggling, rate juggling, rebates, discriminations, thefts, underbilling, wrong classifications, skin games, and frauds on shippers. Every shipper knows exactly what he pays and what his competitors pay, and the chief plaint of the American shipper is absolutely unknown

in Germany." American railways should make such a contrast impossible.

The Russian revolu-The Revolution in tion has been parthe Baltic Provinces ticularly devastating in the Baltic provinces. There distress has been the lot of people who are in sympathy with neither the revolutionists nor the autocracy. Generations ago this region was settled by German families, many of them of lordly wealth and station. In the course of the years they have become patriotic Russians, though they have kept their Teutonic blood They comprise the great landowners, soldiers, bankers, merchants, scholars, and rulers of the region. With their loyalty to Russia they have a Teutonic sense of the right to their own traditions, customs, and privileges, and they cling to the German language. They long ago obtained and have until recently preserved inviolate certain concessions which the autocracy has granted to no other portion of the Empire. The university at Dorpat, for instance, has had its own police and court, and its members have not been answerable to the local officials of the Czar. It is these people of German descent, therefore, who have given character to the Baltic provinces. Some of the Czar's most trusted Ministers have always come from this German element, which has been a strong force in the Empire. Russians proper in these provinces are, as a rule, bureaucrats and officials; the Germans, for the most part, constitute the landed aristocracy, and are still largely imbued with the spirit of feudal-The Letts, on the other hand, as the Slavic people in that region are called, are generally of the lower classes; they are the peasantry, the small dealers, and the tenantry. It is the Letts who have been engaged in a violent and destructive uprising in the Baltic provinces, and the object of their attack is mainly the Teutonic upper classes. In the meantime this German population has had many of its ancient privileges revoked by the Imperial Government. Its traditions have been violated and its feelings flouted. Even the name of the city of

Dorpat has been changed to Yuryev. Between the Letts on one side and the autocracy on the other, the people of wealth, cultivation, and high spirit in this part of Russia have been thrust into a condition of misery and helplessness. In the region around Reval they have been driven from their homes, which have been burned and wasted; some of them have lost their lives, and others are crowded into the fortified portion of the city called the Dom, there to face death from hunger and destitution. The Letts now are in turn suffering; for the Imperial Government has been characteristically unfeeling in visiting reprisals upon them. Action has already been taken for the raising of a fund in the United States to relieve the distress among the Germans and the Letts, and the Merchants' Exchange National Bank of New York is acting as the depository and forwarder of contributions. The experience of the Baltic provinces is an illustration of the fearful waste, not only of property, but also of human life, energy, and character, which is the penalty of such a convulsion as that through which Russia is now passing.

&

Last week two important Russian congresses were held in Congresses Russia—one by revolutionists, one by conservatives. The Congress of Revolutionists was held at Imatra, Finland, and lasted two days. Ninety delegates were in attendance, representing the central committees of the Social Democratic Revolutionists, the Peasant League, the Council of Workmen, the Polish Socialists, and the Finnish Revolutionists. The collapse of the December risings had apparently disheartened all except the Poles, who wished to make another immediate at-This desire was voted down, and the conference decided to postpone further revolutionary operations until spring, when agrarian troubles are expected to begin again. As to the Duma, or proposed parliament, the Congress thus put itself on record:

Owing to restricted and unequal suffrage, the arbitrary rule of the satraps of martial law throughout the Empire, and the countless arrests and repressions of the true defenders of political freedom and of the interests of workmen, the latter are able to enter the National Assembly only accidentally and in small numbers. The existence of such a caricature of a National Assembly as a feature of constitutionalism will only serve to interest the autocratic and bureaucratic systems, extend their calamitous rule, help to improve the credit of Europe, and forge new financial chains for the nation.

At Moscow the Congress of Noblemen They demanded (1) a strong was held. power, using sensible measures to suppress revolution and to protect peaceful Russians from violence; (2) the immediate announcement by the Emperor of the date of the convocation of the Duma, not later than April 28; (3) the sacrifice of the dreams of the Poles and other border nationalities to the interests of the whole nation, for Russia is one and indivisible; (4) the maintenance of the inviolability of private property, but (to enable peasants to buy private holdings) the sale of unoccupied Government lands on easy terms, and the establishment of a system of easy credit. Two days later the Emperor showed his heed of the first of the statements regarding In receiving a deputation from the Government of the Province of Kursk he said, as reported:

My brothers, I am most glad to see you. You must know very well that every right of property is sacred to the State. The owner has the same right to his land as you peasants have to yours. Communicate this to your fellows in the villages. In my solicitude for you I do not forget the peasants, whose needs are dear to me, and I will look after them continually, as did my late father. The National Assembly will soon assemble, and, in co-operation with me, discuss the best measures for your relief. Have confidence in me. I will assist you. But I repeat, remember always that right of property is holy and inviolable.

As helping to solve the agrarian problem, the Government is now considering appropriating a huge sum to compensate private owners for land which the Government would like to expropriate for distribution to the peasants. The operation would be accomplished by the Peasants' Bank's purchase of the lands and their sale to the peasantry on the installment plan. The difficulty in all this, of course, is the size of the sum necessary, the impossibility of obtaining it in Russia, and the well-nigh impossibility of adding to the already great sums borrowed from abroad and those which must still be borrowed in order to meet the deficiency in the budget.

2

The Danes have again Frederick VIII. a "Frederik" on the of Denmark In the list of throne. Danish kings since 1513 there has been an uninterrupted alternation between the two names Christian and Frederik. Throughout Denmark last week, while Frederick VIII.'s accession was hailed with appropriate satisfaction, sorrow at the death of Christian IX. was, of course, the dominant sentiment. The affecting grief of the members of the remarkably united royal family was reflected everywhere in the little kingdom. From the whole world, too, there came unanimous eulogy, finding expression in the public press of whatever political opinion and in the thousands of despatches sent to the Amalienborg, the palace where the late King died. Family services had already been held over his body. The interment takes place at the cathedral of Roskilde, about twenty miles from Copenhagen, and the ancient capital of Denmark. Once the town had a hundred thousand inhabitants; now it contains only about six thousand. cathedral shelters the tombs of most of the Danish kings, from the time of Harald I., who died in 987. The bodies of a number of the early monarchs are entombed perpendicularly in the huge columns of the old cathedral, doubtless emphasizing the sentiment that the kings were veritable "pillars of the Church." The Danish crown worthily descends to Frederick VIII., who, in character, ability, and popularity, strikingly resembles his exemplary father. The new King is sixty-three years old. At the age of twenty-six he married Princess Lowisa (Louise), the daughter of Karl XV. of Sweden, the tallest princess in Europe, and at the time of her marriage perhaps the wealthiest, as inheriting the property of her mother, a sister of the late King of Holland. The King and Queen have eight children. The eldest is Prince Christian, now Crown Prince, who married the beautiful Princess "Adiny"—as she is

affectionately called—or Alexandrine of Mecklenburg-Schwerin. The King's second son, Prince Karl, is now Haakon VII., King of Norway. Prior to the proclamation of his accession King Frederick held a council of state, at which the Ministers tendered their resignations and were requested to retain their posts. Afterward the new ruler, surrounded by the princes, received the Cabinet Ministers, the presidents of the Landsthing and the Folkething—the two houses of the Danish Riksdag, or Parliament—and the chief court, civil, and military officers. Then the Premier, Jens Christian Christiansen, stepped out on the balcony of the palace and shouted to the throng of fifty thousand people below, "His Majesty King Christian IX. is dead! Long live his Majesty King Frederick VIII.!" Hurrahs broke from the crowd, the flags on all the public buildings were run up, and a royal salute thundered from the city's forts. The King then appeared on the balcony and addressed his people as follows:

Our old King, my dearly beloved father, has closed his eyes. He fell asleep peacefully and calmly, having faithfully discharged his royal duties to the last. In taking over the heavy heritage placed on my shoulders, I cherish the confident hope, and offer a sincere prayer, that the Almighty may grant me strength and happiness to carry on the government in the spirit of my dearly beloved father, and that I may have the good fortune to reach an understanding with the people and their chosen representatives on all that tends to the good of the people and the happiness of our beloved fatherland. Let us join in the cry, "Long live the fatherland!"

₩

There may not be so much The Chinese about partitioning Army China if future military reviews there continue to mark such progress as did the one recently held near the city of Hosien. The scheme of the maneuvers was the assumed invasion of the metropolitan province of Chili by a southern force from the province of Shantung. During the entire maneuvers some thirty thousand men-threequarters of the Northern Army-were engaged: the final parade showed 20,000 infantry, 1,200 cavalry, 1,300 artillery, with 120 field and mountain guns, and, finally, 1,100 engineers. The infantry

was armed with Mauser magazine rifles of the 1888 pattern, with a short dagger bayonet, many having been made at the Chinese arsenal at Hanyang. The cavalry was armed with Mauser carbines and swords; the men were mounted on Mongolian ponies, which, though small, were in good condition; the saddlery and accouterments were bad and the men had no spurs. The Chinese cavalry is proportionately much weaker than the infantry, and years will be required to perfect it. On the invitation of the Imperial authorities, thirty officers, representing foreign armies, attended the maneuvers. These guests sharply criticised the generalship displayed; for instance, the absence of proper support for the artillery, which they thought was injudiciously placed. But the foreign officers gave abundant praise for the control of the troops and the steadiness of discipline exhibited, the latter bearing favorable comparison with that of European troops. For example, an observer, while riding behind some of the Chinese soldiers lying in cover, noticed that not one turned his head from attention to his work. Even the very critical correspondent of the London "Times" remarks in that paper: "Better fire discipline could scarcely be conceived. The manner in which the drivers handled their teams and brought the guns out of line one by one was a sight for gods." He adds that the commissariat arrangements were admirable. All this may be said to be the creation of the past four years, and is due to the genius of Yuan-Shi-Kai, Viceroy of the Province of Chili, probably the most influential man in China to-day. There was a time, not so far back either, when the appearance of Chinese troops meant mostly a display of banners and parasols. But those military experts present at the recent maneuvers who were familiar with military conditions in China even five years ago were astonished at the revelation of military efficiency, especially in the infantry. Progress in that branch of the service is not astonishing, however, when it is remembered that under Gordon the Chinese marched with seeming tirelessness and fought with courage. From such material Yuan-Shi-Kai has created a provincial army which will be the nucleus of an imperial military reorganization.

In the task of building up Foreign Aid an army in China the great need is not men but officers. In consequence, Yuan-Shi-Kai and the other viceroys who have imitated him have obtained officers from Japan; the troops already give many evidences of Japanese training. But China needs something besides officers; she needs the Japanese samurai spirit—that military tradition which has made Japan an incredibly easy victor, first over China and now over Russia. China has now to overcome the opinions which for centuries have caused the profession of arms to be a little esteemed one. Consequently ambitious young men have shunned it. They can hardly do so in the future, now that the Government has established military colleges at many of the capitals of the eighteen provinces. Americans have a peculiar interest in the military college at Ngangking, the capital of the province of Nganhwei, for its students and those of the training camp are treated free at the clinic of the American St. James's Hospital. In addition, a year ago Dr. MacWillie, in charge of the hospital, offered to Commander Tan, of the military college, to train an ambulance The offer was eagerly accepted. Twenty-four men were thereupon taught by regular lectures and given practical experience at our hospital clinics. course included instruction in the treatment of wounds and fractures, in asepsis, in bandaging, and in the handling of stretchers. The Chinese were not long in attaining creditable proficiency. This ambulance corps was the first ever organized in the Chinese army. It marked a new and definite departure in the Empire's annals, not only of militarism but of humanity. In these times of anti-American feeling in China, due largely to our harsh application of the Exclusion Act, it is a satisfaction to know that in the Chinese army itself—the outward expression of an awakened nationalism-American influence of another and better kind has made itself felt.

Last week the Protestant A Significant Missionary Boards united Dinner in giving in New York a dinner to the Chinese Commissioners. Something over five hundred guests were present, and more would have been there if they could have been accommodated. The event was doubly notable. Fifty years ago the Christian churches would certainly not have offered this honor to representatives of a pagan nation, and probably the pagan representatives would not have accepted the dinner, if offered. Missionary service has educated both Christians and pagans. The lews in the first century looked upon pagans with commingled hatred and contempt. They would fellowship no pagan unless he were "born again" and became a Jew. When they commended a Roman centurion, it was not for his value as a man, but because "he hath built us a synagogue." Jesus Christ inculcated a different spirit. He commended the centurion for his spiritual worth. Paul, first to catch his Master's spirit, told the idolworshipers at Athens that they were the offspring of God and that their idol-worship was a praiseworthy seeking after God; and Peter was explicitly taught in a vision that he was not to refuse to eat with pagan commissioners. These two tendencies—the Jewish and the Christian—have contended in the Church ever since: and the dinner to the Chinese Commissioners is a striking evidence that the Christian spirit of fellowship with pagan peoples at last dominates in the Christian Church. Nor is the testimony of the Chinese Commissioners to the value of Christian missions, as measured by Chinese standards, less remarkable. Witness this extract from the address of the Viceroy Tuan:

We take pleasure this evening in bearing testimony to the part taken by American missionaries in promoting the progress of the Chinese people. They have borne the light of Western civilization into every nook and corner of the Empire. They have rendered inestimable service to China by the laborious task of translating into the Chinese language religious and scientific works of the West. They help us to bring happiness and comfort to the poor and the suffering by the establishment of hospitals and schools. The awakening of China, which now seems to be at hand, may be traced in no small

measure to the hand of the missionary. For this service you will find China not ungrateful. Protestant missionary work in China has not created Chinese prejudice against America; but it has done much to counteract the hostility excited, not unjustly, by some commercial boors abroad and some political boors at home.

٠

The resignation of the The Achievement Rev. William S. Rainsof Dr. Rainsford ford from the rectorship of St. George's Church, New York, happily does not bring to an end the distinctive work which he there initiated and maintained. For twenty years and more he has brought the power of a vigorous and electric personality to bear upon the lives of thousands of individuals; but he has also organized an idea and embodied it in a church. For over a year Dr. Rainsford has been in Europe; but the church which he has brought to life by teaching it how to spend its life for the community has been doing its work with continued vigor, under the Rev. Hugh Birckhead, his assistant-incharge, now chosen as his successor. St. George's is as great a monument to a man's faith as could well be imagined. Dr. Rainsford found it decadent; instead of engaging in the business of getting support for it, he set it to work. He made it go into the boarding-houses and tenement-houses; he set it the task of maintaining a trade school; he put before it problem after problem, showed it the way to find the solutions, and then committed to it the labor of working out those solutions in practical, visible form. As a result he has in twenty years built up one of the busiest and one of the richest churches in the land. It is busy in practical work for the good of humanity, it is rich in resources some of which may be measured in money, and others measured only in personal devotion and activity. Dr. Rainsford has now had the wisdom to see the limit of his own strength. The marvel is not that he cannot bear the burden longer, but that he has borne it so long and so erectly. He has set before all the churches of the land an example which they will find it difficult but exhilarating

to follow. He has preached not only with words, but with deeds, a sermon on the text, "He that loseth his life shall find it;" and he has written that sermon in enduring stone and in still more enduring institutions.

Reform Needed in Sunday-School Instruction

The Outlook agrees with the "Pilgrim

Teacher" in its criticism of the course of study presented by the International Lesson Committee intended to cover the next three years. "This course," says the "Pilgrim Teacher," "seems to us to be a failure, and lacking in the very elements necessary to make such a course succeed. It is simply forty selected passages, brought together without attempt to group the teachings under main heads, and failing to show any real progress of thought. It is not an advanced course in any sense, and seems to us decidedly inferior to the regular lessons, except in this respect—that most of the selections are longer than those assigned in the regular course." The International Committee has never receded from the original idea of making lessons which are texts for conversational sermonets to be preached by lay teachers, male and female, to their pupils. The conception of a systematic graded course in the study of the Bible, pursued along the lines and in accordance with the methods of modern education, is one which they have never perceived, or perceived only to reject. The result is that the International Course is gradually being abandoned, and churches are substituting their own courses or lamely attempting to use the International Course as a basis for systematic study by various supplementary devices. The "Pilgrim Teacher" calls for a radical change in the International Lesson Committee, and we suspect that it is right in thinking that only thus can an international course be secured which will serve the purposes of a real Biblical education. According to the official report, this Committee directs the Bible study of nearly twentysix millions of people. It should be composed of men who are familiar with modern pedagogic methods and in harmony with the best spirit of the Church of to-day.

Definition by the diction-

⊕

The Nuisance ary shows that a nuisance of Noise is that which annovs or injures. The excessive noises of a great modern city do both, and in a majority of cases the nuisance is quite unnecessary and often malicious or willfully perverse. Whenever a citizen has the courage and determination to stand up for the public comfort and rights in such a matter, commendation and assistance should be forthcoming. This is true of the brave fight now being made by Mrs. Isaac L. Rice, of New York City, against the shriekings, in season and out of season, legal and illegal, excessive, repeated, and continuous, from the whistles of tugs and steamboats in the rivers and harbors of the metropolis. Mrs. Rice had an exact record made of the number and length of these blasts in the night, and found that at least twice they exceeded twenty-five hundred. One can imagine the distress caused to sick or wakeful people in hospital or out. Several hospital superintendents have indorsed the attempt to reduce this injurious practice, and have declared positively that serious harm was done to many patients thereby. Dr. Gregory, of Bellevue Hospital, for instance, points out that often an hour's sleep to a delirious patient may mean life, and that its disturbance by shrill or hoarse or incessant whistles may mean Mrs. Rice has also gathered abundant proof that most of this noise is unnecessary and some of it illegal. Why, for example, should an insignificant tug carry an enormous whistle with a steam pressure of two hundred pounds? Why should tugboat masters be allowed to call their absent crews or wake up stevedores on a wharf by midnight screaming from the middle of the river? Why should tugboat captains be allowed to gratify their idea of sportiveness and sociability by "tooting" without visible cause, so that an Albany boat captain declares that eighty per cent. of the whistling is sheer rowdyism? The extent of the evil and urgent need of reform have been proved abundantly by Mrs. Rice's investigations, and, indeed, " The Pipe of

trothed.

and curses God:

are matter of general knowledge. But when the question comes up as to whom we should look for remedy, inaction and indifference are met. The United States Government, although it has control over navigable waters, appears not to possess the right to regulate steam whistles; the Police Department refers complaints to the Board of Health; the Board of Health is spending all its appropriations in other ways. So nerves continue to be shattered, sleep to be made impossible, suffering of sick people to be unrelieved. Ultimately this will be seen to be part of a larger question of municipal comfort and health, and all wearing and nerveracking noise will be obviated or reduced to a minimum.

What may be termed an

experiment in the music-

Desire '' drama form is the "Pipe of Desire," performed in Boston last week. It is called an opera; it is rather an imaginative portrayal, in verse, acting, and music, of a very human experience. A peasant, Iolan, who has earned his home "by the might of his strong arm," encounters on the eve of his wedding a company of friendly elves. Contrary to the ancient law, they permit themselves to be seen by him. At their demand the Old-One, their king, plays against his will on the magic pipe for them to dance. Iolan, amused, laughs at the king and the pipe; he boasts of his strength and of the money he has earned; in requital, he is made to dance by the magic of the pipe. Then, in spite of warning, he seizes in self-confidence the pipe himself, and plays upon it; and the music rouses in him a desire for his be-

"Where is this God?
Where dwelleth He?
For I would take Him in my hands
And throttle Him.
You God, if you have heard me on my knees
Give thanks for every pittance
Won by reeking toil,
See, as I hurl the gold you've turned to lead

him; but her feverish journey over rocks,

through thorn bushes, across icy streams,

ends with her death in his arms. Iolan,

in his rage of grief, hurls away his money

His cries for her bring her to

Back in your mocking face, And hear me curse you! No, fool, there is no God, And—I am all alone."

Then the Old-One speaks:

"There is a God whose laws unchanging No man may hope to disobey. Upon His Pipe you blew your one desire, Forced your own will upon the ordained way. Man has his will, Man pays the penalty."

All that he had won now become worthless in his hands, Iolan, humbled, confesses his willfulness and dies, while the elves in the forest chant, "All is not amiss—nothing is wasted." Both the author of the text, Mr. G. E. Barton, a Boston architect, and the composer of the music, Mr. Frederick S. Converse, who is Assistant Professor of Music at Harvard, are Americans. Their joint work is American in the freedom of its structure; and in symbolizing lawless strength and the Nemesis which follows the lawless use of strength is peculiarly applicable to America. Mr. Converse has given this theme a setting of genuinely dramatic music. He has used the Wagnerian idiom with its melos and its leading motives. If in a single hearing the music does not seem to be marked by a distinct style which is recognizable as the composer's own, it is by no means marked by the insincerity of mere imitation; it is spontaneous and expressive of the progression of dramatic feeling from beginning to end. Mr. Converse has written what musicians call a good " score." Both orchestrally and vocally it is the work of a man who understands his medium. This was, so far as we know, the first performance in America of a music-drama by a native American composer, and is notable for that if for no other reason. Mr. Walter Damrosch's "Scarlet Letter" was composed and performed in America, but Mr. Damrosch is not a native American. Mr. J. K. Paine's "Azara" is an opera by a native American, but it has not been performed in this country. The "Pipe of Desire," moreover, is less an opera and more consistently a music drama than either of these compositions, and also more than either of these displays the spirit of the innovator. It is not likely to prove popular; but it marks

a point in the development of American music worth recording.

A Remarkable
Bit of Acting

In its own way—and that way may without misapplication of a much-abused

word be called unique-Mr. Henry de Vries's impersonations in the play "A Case of Arson," which has now been seen for some weeks in New York City. form a notable piece of acting. When one is told that this actor presents in his own person seven different characters. as unalike as can be imagined, and that these succeed one another on the stage with intervals of less than a minute. one exclaims, "Oh, yes! a remarkable tour de force, a clever example of the ' lightning change 'act familiar to the variety stage." But this is very far from the mark. Not only are the seven men distinct as regards appearance—costume, height, size, hair, and the like-and not only does each in facial expression seem individual and consistent with the part played, but the characters are rendered with artistic sincerity and with convincing force. Were they to follow one another at intervals of half an hour instead of half a minute, they would still be honest and vivid acting. The main situation of the play has real emotional power and holds one in its grip somewhat as did that of Irving's "Matthias" in "The Bells." Two brothers, suspected of collusion in the burning of a tobacco factory owned by one of them whose little daughter has perished in the building, are brought before the magistrate for examination, and after them five other witnesses. timid and weak-minded brother who tries to screen the guilty man, and the defiant, passionate culprit who is half-crazed by his child's unforeseen death, yet struggles against the net of evidence skillfully drawn about him until at last he is forced to confess the crime, and breaks down in remorseful anguish, are charactercreations worthy of any stage or any authorship. The play has the disadvantage of being too brief for an evening's entertainment and of being preceded by a silly and rather vulgar farce, but in itself it is one of the most artistic dramatic achievements of the season, and Mr. de Vries in it shows that he has qualities that belong to a great actor.

Last week's session of the inter-Morocco national conference at Algeciras, Spain, concerning Morocco, was important in freeing the Conference from most of the minor questions before it. The Conference now finds itself facing the graver issue which caused the serious strain last summer in the relations between France and Germany. The question is, Who shall control the Moroccan police? France objects to an international control; Germany objects French control, which, according to France, is necessary, owing to the troubles constantly arising by reason of the long Franco-Algerian frontier.

Church and State in France

By the operation of the new law the State assumes a certain control of ecclesiastical buildings in France. The riots in the churches last week in Paris call renewed attention to the great historical event last year in France, the separation of Church and State—a larger historic event, in our opinion, than a change in the form of government.

Any deplorable lack of tact or ridicu lous excess of zeal on the part of Government agents can hardly detract from the great fact that last year France found herself at a turning-point in her intellectual, moral, and religious evolution. In decreeing the separation of Church and State, the French Parliament only confirmed this condition of fact and sought a corresponding modus vivendi. This was the reason for the surprisingly calm tone of the debate in Parliament over the Government's measure. Had parliamentarians been in advance of public opinion, the debate would certainly have been an excited one. But the often excitable members of the Chamber of Deputies and of the Senate followed the discussion for the most part with tranquil attention, regarding that discussion as practically a register of what had already been decided by the people at large.

Yet that discussion concerned a more solemn question of conscience to the French people than any which they had been called upon to answer since 1789, that other year of deliverance. For more than a century from 1801 the French Government had enjoyed the right of nominating Roman Catholic priests to the bishoprics of France in return for the assurance of financial support. The Government also lent such support to Protestant churches and to Jewish synagogues. The main differences which arose in regard to State support had to do, naturally, with the Roman Catholic Church, since the overwhelming majority of the French people belong nominally to that communion. If the State has only just now formally denounced the Concordat with the Vatican, the actions of some of the representatives of the Roman Catholic Church in France have long indicated what was coming. Ever since the establishment of the present Republic, troops for an assault on that form of government have come from Roman Catholic ranks, particularly from the monastic orders. The members of many of these orders are not only conservatives in politics, but violent reactionaries, ready to enroll themselves under any banner so long as it promised to deliver the country from a detested democratic régime. Even the praiseworthy intervention of that broad-minded statesman, Leo XIII., had a result in many ways diametrically opposed to that which the Pope desired. Of course there are many loyal, liberal Roman Catholics in France, whether belonging to the clergy or the laity, who never dream of addressing themselves to Church authorities except on matters religious; but there are others who act otherwise, moving blindly along the grooves of the narrow, century-old tradition which makes religion not only a spiritual but also a political power. Such Roman Catholics in France, as elsewhere on the Continent, are called Clericals. Years ago Gambetta truly warned his country: "Clericalism! There is your enemy!" The events since Gambetta's death have impressively justified his opinion then so urgently expressed.

The fruits of Clericalism in France have been especially seen in our time in the year-long, scandalous negation of justice in the Dreyfus case, in the absurd imposition on a credulous public of a Léo Taxil with his crusade against the Freemasons, in the astounding circulation of that scurrilous sheet "La Croix," and, above all, in the treasonable enterprises of the monastic order of the Assumptionists against the very life of the State. These were followed by a quarrel concerning the right of nomination for vacant sees and of the duty of recalcitrant bishops to the State, events not so much noted by the public as were those of which mention has just been made, but which brought home to the consciences of many of the faithful whether to Church or State—the question of the proper supremacy of one and the other. This question was both political and religious, as will be readily seen, but it is an error to see only politics in its solution, despite the fact that certain prominent French politicians are boasting that they provoked the crisis which has resulted in the rupture of the Concordat. Such politicians are, as M. Paul Sabatier says in his just published volume, like a child who one year plants seed and the next points to giant forest trees as the fruit of that seed. This may be accepted as the view of not only a foremost French Protestant, but also of a man of larger mold. For the author of the standard Life of St. Francis of Assisi belongs emphatically to the Church universal. A sturdy Protestant, his is so large a creed that it includes a real reverence for the many benefits which the Roman Catholic Church has conferred, and for the other great men besides St. Francis whom she has inspired. Hence it is that liberal Roman Catholics of our day delight to do him honor.

M. Sabatier carefully entitles his work, not "The Separation of Church and State" in France, but "The Separation of the Churches and the State." The separation, as voted last year, has proportionately as much to do with Protestants and Jews as with Catholics; in the

¹ La Séparation des Eglises et de l'Etat. Par Paul Sabatier. Librairie Fishbacher, Paris.

opinion of many Protestants, the new law works greater injustice to their own communion than it does to the Catholic. With the history of the improper practices of the monastic and teaching orders fresh in mind, M. Sabatier justly protests that if there were only Protestant churches and Jewish synagogues in France, the question of separation between the churches and the State would not have imposed itself so soon. However, as he adds, in twenty years or in fifty years the problem would have arisen just the same, and have been solved in the same way. For, with all due credit to the waves of feeling provoked by particular acts, such as the Dreyfus injustice, the rupture with the churches was, we believe, in its ultimate analysis, the normal and necessary outcome of democratic laicization.

Again, coincidentally with the above, Roman Catholic internal growth in the direction of free thought should be noted. The shameful record of the Assumptionists and the other traitors to the body politic does not, of course, constitute the record of the Roman Catholic Church in France. Despite such misrepresentation, there exists in France not only a loyalty to the Government on the part of most Roman Catholic priests, but also a growing spiritual breadth, seen, perhaps, more than anywhere else in the circulation of the works of the erudite and liberal Abbé Loisy-even if his books are not addressed to the great Though almost a Protestant, public. this priest remains a Catholic, yet he may be said to have reconquered the liberty of exegetical teaching. He has been followed by such men as Canon Chevalier, Monsignor Duchesne, and Abbé Houtin. Such ecclesiastics are as far from orthodox Clericalism as from the extremes of Calvinism. But, in M. Sa- (batier's opinion and in ours, their appearance marks the end of one kind of Catholicism and the beginning of another. This is borne in upon us more than ever when another of their followers, M. Le Roy, writes:

No authority can make me find, or prevent me from finding, that a certain reasoning is solid or weak; above all, whether a certain notion shall or shall not appeal to my common sense. I say not only that it has not this right, but that the thing is radically impossible; for it is I who think, and not the authority which thinks for me. Against this fact nothing can prevail.

Thus, to-day in the Roman Catholic Church in France there are two Catholicisms—that of yesterday and that of tomorrow. The abolition of the Concordat marks, we hope, the end of Clericalism, or the Catholicism of yesterday, even if we shall still see certain sporadic explosions of fanaticism. The Catholicism of to-morrow, as M. Sabatier prophesies, will, we believe, seek more and more an alliance both with democracy and with free thought-indeed, we have already seen notable open, mutual, friendly discussions assuring this tendency. Though the new Catholicism may not resemble the old any more than the butterfly resembles the chrysalis, it will be the old, after all, in the sense of One who said, "I came not to destroy, but to fulfill."

Is Railway Rate Regulation Constitutional?

Now that public opinion has unmistakably crystallized in favor of rate regulation by Congress, the opponents of Governmental interference have thrown up a second line of defense—namely, that such rate regulation is unconstitutional. The unconstitutionality is urged on two grounds: first, that the Constitution confers on Congress no power to bring inter-State traffic under any such regulation as is proposed; and, second, that, if it has such power, it must exercise it directly—it cannot delegate the power to a Railway Commission.

The United States Constitution provides that Congress shall have power "to regulate commerce with foreign nations and among the several States and with the Indian tribes." It is under this general provision that the bill now before Congress for the regulation of inter-State commerce has been drawn. But it is contended that this general provision confers on Congress no power to enact such a law. This position, carelessly assumed without argument by certain of the daily journals, is presented

×

with historical and legal arguments in its support by Mr. E. Parmalee Prentice in the January "Harvard Review." He contends (1) that this "power to regulate commerce was not given as an indefinite jurisdiction, but was intended as a specific authority to effect certain well-understood ends," such as to raise revenue by Federal taxation and to prevent vexatious interference with inter-State commerce by State regulations; and (2) that the Fifth Amendment to the Constitution, providing that no person shall "be deprived of life, liberty, or property without due process of law," prohibits Congress from interfering with the commercial liberty of the person, whether individual or corporate, except for—he does not specify the exceptions, but let us say except for such purposes as the raising of revenue or the prohibition of vexatious interference with commercial liberty. An instance of the latter is furnished by the charges, reported elsewhere in this issue, preferred by the Kansas oil refineries against the railroads passing through Kansas, that they have purposely adjusted their freight rates so as to prevent Kansas refineries from selling oil outside the State. Without attempting here to summarize Mr. Prentice's argument, we may state his conclusions in his own words, thus:

The right to engage in inter-State commerce is part of the inalienable liberty which, according to the philosophy of that time (1787), has a higher source than the Constitution itself, and whose protection is one of the chief purposes for which government is instituted

Or, again:

The right to engage in commerce is, then, part of the liberty derived from the States which neither the United States nor the States may deny. There is no process of law by which the right may be taken. As the right is derived from State law, it belongs to those to whom the State gives it, whether citizen, alien, or corporation.

He even goes so far as to affirm that the provision of the Constitution that "no tax or duty shall be laid on articles exported from any State" "should forbid taxation of inter-State transportation," though he admits that on this point the practically uniform course of all the later decisions of the Supreme Court of the United States is opposed to his contention. He regards transportation from one State to another State as exportation, whereas the Supreme Court regards only transportation to a foreign country as exportation. On this point the decision of the United States Supreme Court is final. (Woodruff vs. Parham, Thayer's Cases on Constitutional Law, p. 1922.)

And it is equally final upon the general point that the authority of the Congress over inter-State commerce is the ultimate authority, and is subject only to those limitations which either the explicit provisions of the Constitution or its necessary implications put upon the exercise of that power. "This power," said Chief Justice Marshall, in the famous case of Gibbons vs. Ogden (1824), "like all others vested in Congress, is complete in itself, may be exercised to its utmost extent, and acknowledges no limitations other than are prescribed in the Constitution. . . . The power over commerce with foreign nations, and among the several States, is vested in Congress as absolutely as it would be in a single government, having in its constitution the same restrictions on the exercise of the power as are found in the Constitution of the United States." Sixty-three years later Mr. Justice Bradley (Robbins vs. Shelby Co., etc., 120 U. S., Thayer's Cases on Constitutional Law, 2056), for the Court, reaffirmed the same principle in language equally explicit: "In the matter of inter-State commerce the United States are but one country, and are and must be subject to one system of regulations." In view of these decisions by the Supreme Court of the United States, the notion that the powers of Congress over inter-State commerce are limited to specific objects, such as the raising of revenue, or the prevention of restrictions by the States, may be dismissed as a purely academic proposition, Whether those powers should have been so limited or not it is not important to consider. The Supreme Court has decided that they are not so limited.

Furthermore, certain specific declarations of the United States Supreme Court are of value as showing what the Congress can do and what the States cannot do in the matter of inter-State commerce. Thus, Congress can give a franchise to an inter-State railroad and the State cannot tax such a franchise (California vs. Pacific Railroad Company, 127 U.S.); impliedly it can levy a tax on goods transported from one State to another. for the State cannot levy such a tax, because to do so would be to usurp the power of Congress to regulate inter-State commerce (Reading Railroad Company vs. Pennsylvania, 15 Wall, U. S.); under its power to regulate commerce it can "without doubt provide for granting coasting licenses, licenses to pilots, licenses to trade with Indians. and any other licenses necessary or proper for the exercise of that great and extensive power" (License Tax Cases, Thayer's Cases on Constitutional Law, p. 1276).

The Outlook does not question that the liberty safeguarded by the Constitution includes industrial liberty, nor that the right to engage in inter-State commerce is a right which the Congress cannot arbitrarily deny to the citizens of the country. But this right must be exercised subject to such regulations, general in their character, as are intended to promote the public welfare. Congress can create inter-State commerce railroads and exempt their franchise from State taxation; it can require any person, whether corporate or individual, to take out a license as a condition precedent to engaging in such inter-State commerce, as it requires coasting vessels to do; it can protect its citizens from unjust or unequal freight charges which interfere with the free and untrammeled carrying on of the inter-State commerce. In short, it can exercise all the power which any government can exercise in providing such regulations for inter-State commerce as may in its judgment be necessary for the general welfare, provided its regulations are not in violation of explicit provisions or necessary implications of the Constitution.

Whatever powers any theorist harking back to the time of Thomas Jefferson may think Congress ought to possess, Congress does, in fact, possess those powers which the Supreme Court has declared that the Constitution confers upon it; and they are entirely ample for all the purposes of any legislation at present proposed. How far those powers can be delegated to a Commission is a more difficult question and one which we reserve for future consideration.

The Recovery of Faith

When I was a boy, I was quite religiously inclined. I believed everything in the Bible from Genesis to Revelation. It was the source of all my strength, comfort, and inspiration; and by obeying the precepts and injunctions of it I expected to be justified and saved. Jesus Christ, to me, was a living reality, a being whom I believed had actually come from heaven, was crucified, and rose from the dead, and who sat on the sight hand of God making intercession for right hand of God, making intercession for all his followers here below. God was One to whom I regularly prayed, and with whom I communed as with a personal friend. When I sinned I fell upon my knees and tremblingly begged his forgiveness; a being, of human attributes, whom I feared and loved, and who had the power to raise me up or strike me dead. All these things were not myths, nor even matters of faith alone. I believed in them as much as I believed in my own existence. And from this faith came a joy, even the memory of which is enough to make life worth living. Whether my faith was false, or whether from reaction, I became a blatant and reviling infidel. Having an ear attuned to the harmony and melody of beautiful language, and especially of prose-poetry, I was attracted by the rhet-oric of Ingersoll. His sophistry did not influence me much, but it led me to other works which did. Influenced more by form than substance, I read and re-read the pompous and stately language of the famous sixteenth and seventeenth chapters of Gibbon's "Roman Empire," which shook my faith in the authenticity of the Gospels. From Gibbon I passed to Darwin, Huxley, Wallace, Haeckel, and the materialists, whose conclusions, I foolishly believed, completely upset and destroyed all reality in revelation, and took away all my remaining faith in the Bible, Jesus Christ, or God. I am glad to say, however, that the faith of my younger days had left such an imperious influence upon my soul that, while I professed myself an infidel, I was still unsatisfied; and after groping in the dark for two or three years, I finally became convinced that I was wrong. I became reconstructions of the state of lieve the Bible to be the Word of God, but not with the warmth and feeling with which I used to believe it. I believe in Jesus Christ, but he is to me merely a historical personage, who means but little more to me than Plato or Aristotle. I believe in the existence of God, but this belief is purely

intellectual. It has no more influence over my life than the belief in the law of gravitation. He is a vague abstraction whom I neither fear nor love. My mind, from reading works of science, has become so analytical and dissecting, even in matters of faith, that I even criticise the grammar and logic of prayers. All this I regard as a misfortune. I crave for the faith of my boyhood days; I have struggled for it; on my knees I have begged and implored for it, but it has not come.

This pathetic letter portrays a common experience. But the longing it expresses can never be satisfied. It is but the old cry in a new form, "I would I were a boy again," and the man never can be a boy again. We cannot go back; we must go forward. It is as impossible to recover the lost faith of one's childhood as to recover the lost joys and hopes and loves.

The joys of childhood can never return to the mature man. In the Christmas just past the father and mother had their Christmas joy no less than did their children; but it was not the same. The eager expectation, the bubbling merriment, the ecstasy of delight in the new possession—these were impossible to the onlookers. There was both a quieter and a deeper joy, in which were strangely mingled with the reflected gayety of the children the sorrows and joys of the years that are gone. The grandfather who sat down on the floor beside the baby and showed her how to put her new doll to sleep had a deeper joy in the child's possession than she had in her own; but it was not the same.

The hopes of childhood never can return to the mature man. He also has hopes, but they are not a child's hopes. The one flash and fade with brilliant but evanescent glory like the aurora borealis; the other glow with growing light like the dawn. The one is born of inexperience that has known no trouble and expects none. Stevenson has well interpreted this childhood hope:

"The world is so full of a number of things, I'm sure we should all be as happy as kings."

The other is born of experience; an experience that has met trouble, vanquished it, and made it a minister to a joy and peace that childhood cannot know. Paul has expressed this manhood hope: "We glory in tribulations also,

knowing that tribulation worketh patience; and patience, experience; and experience, hope."

The love of youth can never return to the mature man. Youth has its love and old age has its love, but they are not the same. There is a glory of the spring and a glory of the autumn; for season differeth from season in glory. There is in man's life but one honeymoon. The orange-tree sometimes bears blossoms and fruit at the same time: but in life the blossoms fall before the fruit comes; the blossoms will turn to fruit, but never the fruit to blossoms. Youth and age have each its song of love; but not the same song. From the ample treasures of song we select one interpretation of youthful love, the closing verses of Coleridge's "Genevieve:"

"Her bosom heaved,—she stepped aside,
As conscious of my look she stept,—
Then suddenly, with timorous eye,
She fled to me and wept.

She half enclosed me with her arms,
She pressed me with a meek embrace;
And, bending back her head, looked up,
And gazed upon my face.

'Twas partly love, and partly fear, And partly 'twas a bashful art That I might rather feel than see The swelling of her heart.

I calmed her fears, and she was calm, And told her love with virgin pride; And so I won my Genevieve, My bright and beauteous Bride."

Compare with this the well-known verse of Burns's "John Anderson, my jo, John:"

" John Anderson, my jo, John,
We clamb the hill thegither;
And monie a canty day, John,
We've had wi' ane anither.

Now we maun totter down, John, But hand in hand we'll go; And sleep thegither at the foot, John Anderson, my jo."

The love of old age, the love that goes down the hill that the two climbed together in youth, is not less sacred, and to our thinking not less full of deep and divine joy, than that of the youthful lover in the first rapture of the newly discovered love. But they are not the same; and it would be as idle for John Anderson to attempt to recover the rapture of youthful love as for Genevieve's

lover to anticipate the peacefulness of the love of old age.

What is true of joy and hope and love is true of faith. The faith of childhood once lost can never be recovered. sometimes kept, but at too great a sacrifice. For he who boasts of a childhood faith simply bears witness against himself that, while he has grown in muscular strength, in nerve power, in intellectual capacity, in executive energy, he has not grown in his religious experience. A childhood faith is beautiful in a child; it is a dwarfed and stunted faculty in a mature man or woman. The faith of childhood is born of the child's imagination. It is an unquestioning and therefore an unreasoning faith. He makes no distinction in his own mind between what he has seen and what he has imagined. The perplexed mother need not be perplexed at his nursery tales told with such serious assurance that it is "true, mamma." To him what he has imagined is "true." He is as ready to believe in Santa Claus as in Jesus Christ, in the Arabian Nights as in the miracles of the New Testament. The reindeer and the sleigh-bells are as real to him as the Wise Men and the Shepherds. Do not undeceive him. Life will undeceive him in due time.

But do not envy him. Do not try to go back and recapture that nursery experience. The faith of manhood is of a different sort. It is not an unquestioning but a questioned faith. It is not founded on reason; but it dares submit itself to all the tests to which reason can subject it. The crucible never yet created gold; but it tries the gold and rejects the dross. Reason never yet created faith: but it separates the true from the false. After the crucible appears but little gold, but it is pure. After the reason there appears a shorter creed, but it is vital. Credulity has done the world more harm than skepticism. The only way to know anything is to dare to question everything.

We look back across the years and recall our childhood piety. Heaven was close at hand, just above the clouds, which were its draperies, or just above the starry dome, which was its floor. In heaven was the great white throne, and

the great God, awful or benignant as our fancy happened to paint him, and to him we addressed our childish petitions, sometimes wondering how he heard them, sometimes audaciously wondering whether he heard them at all. This vision of our childhood imagination is gone. It were as easy to reconstruct the castellated glory of the sunrise after the sun has reached the meridian as to rebuild this fabled heaven of our childhood faith. Some try to retain it, and seek in an imaginary world, which they know has no existence, a refuge from a real world of which they are too painfully aware. Some abandon their faith with the imagination with which it was connected, and live as best they can, ruled by conscience but not inspired by faith. But some look back without regret, because the faith of their early fancy has given place to the stronger and more inspiring faith of their manhood. To them God has become the Perpetual Presence; the One who is "never so far as even to be near:" the Great All Their childhood faith in a and in all. Celestial God has grown into the Hebrew psalmist's faith in the Ever-Present God:

"Whither shall I go from thy spirit? Or whither shall I flee from thy presence? If I ascend up into heaven, thou art there; If I make my bed in hell, behold, thou art

there;
If I take the wings of the morning,
And dwell in the uttermost parts of the sea,
Even there shall thy hand lead me,
And thy right hand shall hold me."

The vision of a celestial city and a sceptered and enthroned God has faded and will never return; but in its place has come Whittier's spiritual vision:

" I know not where His islands lift Their fronded palms in air; I only know I cannot drift Beyond His love and care."

Such souls would not exchange the faith of their manhood for their child-hood faith. This manhood faith is indefinable because it is infinite; it is mystical because it is spiritual; it is real because it is unsensuous.

If one's education has been almost exclusively in courses which have whetted his analytical faculties to exceeding sharpness and left his spiritual nature atrophied, he cannot undo the mischief by endeavoring to retrace his steps and go back to his childhood experiences, nor yet by turning from natural science to theological science, that is, by undertaking a new and enlarged course in argumentative literature. He will best find his way to a real, a manly faith, by mingling in literature and in life with men of faith, and by always being obedient to such heavenly vision as is afforded to him. So doing, he will find the light within him, which neglect has dimmed but not wholly extinguished, gradually, and to him almost unconsciously, reviving to re-illumine his life.

The Spectator

Among the many good stories told of General Grant, one has always appealed to the Spectator every time he has heard It is the story of the small "stag" party, where a member started to tell an objectionable story, when he was stopped by General Grant's forbidding look. In surprise he explained or apologized: "But there are no ladies present." "No," was the General's reply, "but there are gentlemen present." This story was twice recalled to the Spectator during a short trip abroad made last summer with a friend, a man of the world, an ex-army officer, now a university professor-a friend whose rule of life is short but inclusive, and, better yet, is vigorously lived up to. This personal code consists of four articles:

> Play your game straight. Do not injure another. Lend a helping hand. Be clean and decent.

It was the last article which received special exemplification.

æ

On board the steamer going over was an otherwise attractive young man, whose bright talk was often offensive because of the character of the stories he was constantly telling. He kept a certain smoking-room crowd uproariously laughing, and thus forced these stories on the attention of others who had occasion to frequent the place. The Spectator's

friend put up with it in silence for perhaps a day and a half, when he found, being both a smoker and a card-player, the situation intolerable, or, as Artemus Ward used to say, "2 mutch." Choosing a chance encounter on deck when no one was at hand to overhear, the man of the code kindly but firmly interviewed the objectionable story-teller. The interviewer acknowledged frankly that, a smoking-room being the sort of institution it is popularly held to be, the "interviewee" was probably "within his rights" in telling there the sort of stories he chose to tell—that is, that no appeal would probably lie to the captain. the same time, added the Spectator's friend, he did not believe it was the story-teller's purpose or wish to deprive any fellow-passengers of the privilege of the smoking-room, as would certainly be the case if he persisted. In short, the Spectator's friend appealed to the young man's sense of consideration for the rights of others in that manly, straightforward way which is almost sure to command respect. The result was that the intervention was taken, not as a rebuke, but as a friendly protest. The young man even attached himself to the little coterie that stood for clean fun in the smoking-room, and gave his own good qualities "a square deal," much to his own self-respecting enjoyment. fact, when he parted from the coterie in London, the young man volunteered the confession that it had been one of the pleasantest voyages he had ever made. The moral courage of the Spectator's friend had vindicated the vitality of the innate virtue of good breeding.

(20)

Perhaps the Spectator has made too much of the incident, and yet two comments passed on it at the end of the voyage seemed to give it significance. One came from a clergyman who thanked the Spectator's friend for what he had done to make the smoking-room tolerable and also for "giving a well-meaning chap a taste of decency." The other came from a supercilious stickler for the proprieties, evidently a solid citizen of acknowledged place in his home town, who said, "I do not understand how it

was possible for you, Mr. Blank, a gentleman and a professor in a university, with young men in your charge, to have anything to do with that foul-mouthed fellow with whom you so constantly associated." In vain the Spectator's friend tried to explain without in any sense making an apology, and urged that the young man had been misjudged. The censor but stiffened in his censoriousness—a type of complacent moral exclusiveness that still survives despite widening appreciation of the fact that "the contagion of suggestion," as the sociologists call it, may be as potent for good as for evil.

æ

The other incident, that of the home voyage, concerned a very different sort of person, a "hero of the ring," a lightweight champion pugilist, well known in the "sporting world." The boat was crowded with that army of returning tourists who all seek to reach America together in early September. At the table assigned to the Spectator and his friend all but one were men, the exception being the meek-looking wife of a yet meeker-looking husband. The pugilist sat next the wife, and his ordinary talk, unrestrained by the proximity, was the most dreadful in constant profanity and vulgarity the Spectator has ever heard. After two meals, lunch and dinner, the Spectator's friend decided that, if the meek husband did not protest, he must. So, with some natural trepidation as to possibilities, he sought an interview with the pugilist and informed him that he must either reform his conversation or dine in his cabin by himself, as the captain would, on appeal, certainly compel him to do. The naïve surprise of the pugilist that he had been offensive was as unexpected as was his willingness to do anything suggested, even to taking his meals by himself. On consideration, however, he acknowledged that that might prove to be—let his word be rendered-"lonesome." "But what shall I cut out?" he asked the Spectator's friend in all sincerity. The latter named a conspicuous phrase or two to begin with. "How's a kid to know there's any harm in them?" he next asked,

"What's the others?" So the Spectator's friend actually made out a list—an index expurgatorius—of twenty phrases that must be "cut out," the pugilist receiving it with thankfulness. It was good to see him conning the list diligently with moving lips until lunch hour, as he sat on deck by himself, foregoing his usual game of poker in the smoking-And he mastered that list—an inclusive list. Not once again, wonderful as it may seem, did he use one shockingly offensive phrase until the boat reached her New York dock. His parting words to the Spectator's friend were, "I thank you for teaching me how to behave among decent folks."

6

Now, the Spectator has no claim of ethical thaumaturgy to put forward for his friend. That friend is simply a type of an aggressive good breeding, a militant decency, which the Spectator rejoices to believe is becoming more and more a characteristic of the gentleman of the future. It is the type of healthy cleanliness that, without pose or pietistic convention, is almost sure of response, sometimes through the mere potency of personal presence, and sometimes through straightforward but tactful intervention for the sanitation of social life. As he counts to-day the many boys' schools where manliness is a cult, where all contamination of evil is excluded on detection regardless of the social standing of the boy's parents, he feels justified in his optimism. It is those schools that are largely giving the leaders to college life, which in generations must mean leadership in the world. These are "select" schools, but not in the sense of the advertisement; schools of high breeding, which run, of course, a certain risk of losing the American tradition of democracy but for the manliness which dominates them. what, I sometimes wonder," said a master in one such school during a chat with the Spectator, "becomes of the boys who by right should be with us but have to be excluded for the sake of the others? Do they all turn to degenerates? For they have lost the chance of early association which they once had,"

REACTION, LIBERTY, OR LICENSE IN RUSSIA

BY E. 7. DILLON

Dr. Dillon, as most of our readers know, is recognized as one of the best-informed writers on Russian topics, and this article from St. Petersburg is the result of observation on the spot as well as of a long study of the divergent currents of Russian agitation and political movements. Dr. Dillon's paper on "The Duma in Russia," printed in The Outlook of September 30 last, may well be read in connection with the present article, and with it will be found a sketch of the literary and journalistic life of the author.—The Editors.

F revolutions are shaped by general laws, they are also marked by national characteristics, and the political upheaval of Muscovy offers us racial traits for which we should vainly seek in the struggles for liberty waged by the English, American, or French peoples. One of these is precisely that rare idealism which I pointed out in a former article. The Russians share the capacity of Oriental races for useless self-abnegation, and are for that reason the stuff of which martyrs and fanatics are made. And that capacity more than anything else gives us a clue to the origin, suddenness, and success of the outbreak which startled the world last fall.

The truth is, a large section of the Russian people had long outgrown its Government. A group of narrow-minded officials ruled one hundred and forty millions, including hundreds of thousands who were wiser and better than themselves. This bureaucracy kept the millions in mental and moral darkness, while it condemned those among the hundreds of thousands who strove to emancipate the rest either to silence or to loss of liberty and exile. That was the state of things when the war with Japan broke out, and it might have gone on unchanged for another ten or twenty years if the Czar's advisers had only kept the peace. But the unsuccessful campaign deprived the autocracy of its prestige and won a hearing for the malcontents, whose name was legion. These men raised their voices against the system which had led to national disaster, and they asserted the people's right to some influence in staving off similar calamities in the future.

If the Emperor had been advised to recognize the fairness of that claim, and to grant it, even at the eleventh hour, all might perhaps have been well. But the only man who had the courage to offer this advice was Witte, and he was no longer a member of the Government nor a trusted adviser of the Czar. Nicholas II. therefore turned to friends of the unregenerate autocracy, and, following their advice, sought to stem the current, but only increased its force.

The people were told that as a revolution was impossible—because they could not hope to struggle with a vast armythey had better resign themselves to the inevitable. But they struck out a line of action of their own-or rather a line of inaction. They ceased to work. Inured to hardship, they underwent the consequent discomfort cheerfully: fearless of risks, they incurred that of famine unhesitatingly. Almost the whole population went out on strike, the wealthy helping the needy. It was an unprecedented spectacle for the onlooker and a novel problem for the monarch. partisans of absolutism were not unanimous as to the means of solving it. Some counseled grim patience: "The strikers must resume work," they reasoned, "because hunger, our ally, will compel them, if only we wait long But could any government wait until its subjects were stricken with famine? Certainly no Russian Ministers could, because the Slav character would not brook the cold, calculating ferocity presupposed by this Fabian policy. Therefore the Czar yielded, the revolution was accomplished, the autocracy

Digitized by Google

abolished. The liberal movement was thus shaped by the national characteristics.

But the end of absolutism was the beginning of chaos. Liberty having been promised, men demanded license. The Czar's officers were publicly summoned, and several actually forced to salute the red flag. A party of "intellectuals" and workmen exhorted the people to strike again, and they struck. A group of anonymous laborers ordered them to strike a third time, and to rise up in armed insurrection against the authorities. And hundreds of thousands obeyed the first behest, while scores of thousands executed the second.

There was no cool calculation, no practical forethought, no wholesome egotism, to serve as a corrective to this ruinous selflessness. The Slav can get intoxicated with an idea which he is utterly unable to grasp, and die a martyr's death for a principle which he cannot formulate. Many of the battle-cries of the Russian revolution are mere book notions. The crowd echoes them, individuals get arrested, wounded, killed for them, but many of those who speak and fancy they also understand are merely calling words to mind. The heroism with which mere striplings and women threw up barricades and died defending them was splendid; but the wild character of the demands in defense of which they fell was pathetical: an eight hours' working day, the abolition of property in land, the bestowal upon soldiers and sailors of the right of choosing their own It was nominally in pursuit of this will-o'-the-wisp that thousands in Moscow and other cities met their death.

This morbid idealism on the one hand, joined with an utter lack of the critical sense on the other, render a revolution far more formidable in Russia than elsewhere. For the suggestibility of the people is almost unlimited. You can tell the Russian masses almost absurdity and move them to make costly sacrifices for the acquisition of the unattainable. I saw many peasants who volunteered to go to South Africa during the war there to fight for the Boers because "the English pagans were forcing them to quit the Orthodox Church." I knew several

who told each other that, as Witte was President of the Russian Republic, henceforth the "Little Father," the Czar, would have it in his power to benefit his children unimpeded by officials. With these men one can do almost anything, especially by offering them land without rent and wages without labor; and as the parties of order neither educate nor bribe them, the factions of disorder are more likely to carry the day. The degree to which the average Russian peasant is plastic would surprise the European or American: Christian sects can make a man of him, Anarchists a wild beast.

A few instances of peasant character taken from incidents of the revolution may show the reader how difficult it is to make a forecast of what may be expected of the average Russian in the near future.

In the Province of Saratoff there is an estate belonging to the Ministry of Agriculture, which existed solely for the behoof of the peasants. It supplied them with models of every improvement in methods of tilling the soil that could be introduced into the district, lent them all kinds of implements, and helped them to buy some for themselves. It was in charge of a man who himself was a peasant, and had been the village elder.

Now, a few weeks ago a band of riotous peasants came to this manager and said, "We are going to pillage and burn your farm." "But," he replied, "this is not my farm, as you know. I am not a landowner." They answered, "It doesn't matter in the least; we are going to burn it down all the same." "You must be mad," he answered; "it is your own, lads." "That may be; but the fact is, we have received the order, and we are going to carry it out." Thereupon they took away the implements, drove off the cattle, pillaged the whole estate, stuffed a lot of things into the houses and set them on fire. And then they went away contented. Surely that was idealism with a vengeance!

But before going away, an official said to them: "Send a message, lads, to the representative of the Ministry, and say that you have set fire to the houses, and that Cossacks ought to be sent out at once to stop the rioting." And they

actually sent a courier of their own party with this verbal message. Immediately orders were given to the Cossacks to rush off and do what they could to quench the fire and punish the rioters. They galloped away, found the peasants, ordered them to give back the things stolen, and were obeyed without a murmur. And one of the peasants then said to them: "Instead of sending us to Siberia, let us have a good flogging." And they had it there and then. The Cossacks flogged them thoroughly with their whips, and they submitted to it almost cheerfully, and when it was over went away grateful.

That occurrence, which is truly typical, proves how easy it is to hypnotize the Russian peasant and enlist him in any cause, even though it be a movement against his own class interests, and how readily he may be fendered either meek and docile or brutal and cruel. Another striking instance may be found in the burning of Tomsk.

From an early hour the inhabitants of the famous Siberian city were astir. Mischief of some kind was brewing, and everybody had a presentiment, but few possessed any knowledge of what was coming—it might be an attack on the intellectuals, people alleged. It was the day of the month on which all salaries are paid throughout the Russian Empire, and the railway directors had fixed three in the afternoon for the payment of their officials, many of whom had meanwhile entered the theater hard by, where a liberal meeting was being held. At one o'clock a boy wearing a high fur hat darted in at the theater door and yelled: "The Black Hundred is coming here, and there are two hundred of them. Look out!" And the next moment over three hundred persons present at the meeting crowded to the doors, squeezing. crushing, and killing each other. Some hastened home, panting, trembling. Others, fearing to trust themselves on the streets, sought refuge in the railway building near the theater. Meanwhile the Black Hundred were advanc-They had killed five men who had met them on the way and refused to uncover. Further on they killed five more, whereupon the newly formed militia fired at them, scattered them, and then entered the railway building.

But the Black Hundred, rallying, moved ever steadily forward, along streets which were deserted. Finally they entered the cathedral, which was soon ablaze with wax lights, musical with solemn chants such as may well have come down from the Apostles. The Archbishop, standing at the altar, was singing a Te Deum and administering his blessing to the longbearded fanatics, who stood there attentive, earnest, eager to die for the cause of God and the Czar, as they understood They might have been crusaders about to go into battle, or martyrs on the point of sacrificing their lives. To the liberals and intellectuals they were known as men of the Black Hundred, partisans of the old régime, haters of the

Fortified with the archiepiscopal blessing, the band left the shrine, surrounded the railway house, and began to smash the windows with stones. A perfect hail of bullets from the second and third stories was the response to this. intellectuals inside were minded to sell their lives dearly. The Governor, informed of what was going on, despatched a hundred Cossacks and a company of regular soldiers, who encircled the house, but could do little against the thousands of people. Shots were for some time exchanged between the besiegers and the besieged. Terror seized the souls of the confined railway men, and they tried to get away. Engineer Klianoffsky came out first; a bullet entered his foot, he fell, and the crusaders killed him on the spot. Engineer Schwarze next tried his luck, actually got away from the doomed house, and ran nearly twenty paces forward, when he, too, was overtaken and killed. Uliashoff and Wolffson then made a rush for it, but were murdered near the theater. Others who followed were caught and slain in various ways. And the corpses lay there as a warning.

"The women and children may go if they will," shouted the men of the Black Hundred. But the women had beheld the bloody scenes from the windows and were afraid to move. This refusal infuriated the mob, who brought up torches and set fire to the house. And now the last act of the drama began.

The street was no longer wholly dark. Irregular tongues of fire shot upward and sideward from the edifice in which the railway men were besieged—tongues of fire which now illumined awful scenes and now seemed quenched in clouds of gray smoke. The stern crusaders who were lately praying in God's stone-built temple stood cheerfully around the beleaguered house, armed fantastically with pitchforks, pikes, shillalahs. Men, women, children, rushed to the windows of the house and shouted for help, throwing suasion and pathos and maddening terror into the modulation of their voices, which died away in the hum of the bloodthirsty mob or the crackling of the spreading flames. Rescue! Help! Mercy! Nobody in that dense crowd knew the meaning of the words.

Nobody? Surely some few. But the majority, too, had lost their character of human beings. They now seemed to delight in the spectacle of men, women, children, caught as in a rat-trap, and tortured diabolically for the pleasure of a mob. They also amused themselves by firing from time to time at the beseeching figures in the windows, "potting" now this one, now that. Homo homini lupus. "Have pity, dearest brothers, have pity on us! Oh, save us!"

Yet one of the witnesses hastened away, sought out the Archbishop and implored him in God's name to allay the passions of the mob, to save the victims whose forms were now gliding quickly, often, across the windows, whose cries were growing more piercing, whose terror was more intense. But the prelate was deaf or hard-hearted. He moved not. But the intercessor was persevering; he pleaded, he urged, he remonstrated, he adjured. Finally the spokesman of the Almighty arose slowly, went forth into the street, surveyed from afar the concourse of men made beasts, to whom his word might perhaps have given back their human character, and, raising his hands aloft, invoked a blessing. it for the victims? God knew. beasts who had once been men could only guess, and, claiming the blessing for themselves, they went mad with the intoxication of cruelty. There was no hope more for the beleaguered.

At one of the windows is a longbearded man. His hands are lifted up-He stands with part of his body projecting; his voice, pitched in the highest key, is shrill and piercing. His words are few, quickly spoken, accompanied by gestures. Pity! Mercy! Life! The mob moves nearer to the burning house, looks up with interest. Has he then touched their bowels of pity? Truly, for six of them hold out their hands to catch him and encourage him to jump. It is risky, for he stands three stories from the street, but there is no rescue. now without danger. The venerable old citizen lowers the upper part of his body till he is almost in sitting posture and then jumps. He falls, not into the arms of the six, which were suddenly withdrawn, but on the pavement—hurt, but not dead nor perhaps dying. The six who had deluded him with hope now surround him and beat him fiercely until he is dead and has ceased to resemble a man. Was the bishop's blessing for them?

Now it is a student who is making his escape from this hell upon earth, running wildly, headlong into the ghastly shadows of the night. One of the crowd espies him. Down with the student! After him! Fear runs well, but hate is quicker. One man coming up hits him on the head with a pole. The youth falls, and several figures stoop down over him. shout and laugh and seize hold and lift the stripling, manipulating the long stick. The crowd opens, and the scene is visible. They are stuffing the pole into his mouth and down his throat, and now they have split open his skull. . . . Alleluiah! another criminal is punished. Welcome the next! Thus, clubs, poles, forks, knives, did their work. And the executioners then plundered their victims, taking rings from their fingers and robbing them in every way.

By six o'clock the blood-soaked ground was strewn with corpses, naked and deformed. The space in front of the railway house and theater was thronged with over forty thousand people, against whom the soldiers felt themselves power-

For a long time all hope for the besieged had vanished. At first the fire was choked with smoke and died out; then petroleum was poured on the smoldering embers, and the flames burst out as before. And hours passed in these vicissitudes, ages to the victims, minutes to their torturers. The cries of the women and of some of the men for pity would have melted hearts of stone. By ten o'clock the second and third stories were like fiery furnaces. Wild figures flitted before the windows; terrible voices pleaded for life. Rifle-bullets brought down some to the pavement, where they were beaten to death by the joyous crowd. Others in despair flung themselves into the street, and were finished off in turn. Some climbed down by the rain-spouts, and on their arrival below were hammered to death amid shrieks of delight. tongues of fire grew longer, the crackling of rafters louder, the moans of the sufferers more continuous, until they mingled in one blood-curdling wail. Then from

within the doomed building came the sounds of revolver-shots. Some of the victims were putting each other out of pain; for any death is better than to be tortured by the mob. Gradually the cries grew fainter, and the crackling of beams and woodwork drowned all other sounds, until, with a terrific crash, the ceilings and roof were sucked into the sea of fire, and bury the bodies of sixty-five human beings.¹

And the men who played the part of demons in this pandemonium of Tomsk were mostly Russian peasants, of whom there are over eighty millions in Muscovy. It is their attitude that will shape the destinies of the Russian nation. And their attitude depends upon the strong will of the few who shall first succeed in hypnotizing them. If the Anarchists are successful, the new year comes fraught with ruin to Muscovy; but if the friends of order are first in the field, Russia may soon be herself again.

St. Petersburg.

NEED OF AN INTERNATIONAL CONFERENCE

BY EDWIN MAXEY, M.DIP., LL.D.

TERE there ever any doubt as to the need of a conference of the nations for the purpose of arriving at a better understanding as to several questions of international law, the Russo-Japanese War should have dispelled such doubt. Nor were the unsettled questions which gave rise to disputes confined to the relations of the belligerents; in several instances the tension between the belligerents and neutrals approached the breaking point. With the rapidly increasing interdependence of nations, due to the modern organization of industry, there is an ever-increasing need of a definite agreement as to the rules governing international relations. That the need of definite rules is far greater now than when nations were to a great extent agricultural, and hence self-sufficing, and the means of communication were such as to bring them rarely into contact with one another, is clear. This is merely another way of saying that there was by no means the same need of international law a few centuries ago that exists to-day.

Nor is the close of a great war an inopportune time for an international conference. War always puts a severe strain upon law and lays bare the weak and faulty parts which until the test came were unnoticed. The necessity for amendment is fresh in the minds of There has been a rapid accumulation of experience, and to some extent a new spirit is prevalent. While the lesson of the cost of war is still fresh in the mind, nations are more impressed with the advisability of avoiding it, and take more kindly to suggestions which look to the attainment of this end.

¹ A thousand was the first estimate. It was, however, greatly exaggerated.

That we may the better appreciate the need and the opportuneness of the time for an international conference, it is fitting that we turn from general considerations to an examination of some of the specific questions which should receive the most careful thought of the conference and upon which, if possible, an agreement should be reached.

Having in mind the experience of the recent war, there is little room for doubt that among the questions to be discussed, concerning which there is urgent need of a definite agreement, are the rights of belligerent vessels in neutral ports and waters, the extent to which the neutral may furnish them coal and provisions, the length of time they may lawfully re main when not in urgent need of repairs in order to make them seaworthy, and under what circumstances they should be required to disarm.

The twenty-four-hour rule set forth by England in 1861, and followed by it, the United States, and some other countries, is perhaps sufficiently definite; but as this rule has never been adopted by France and some other leading Powers, the question cannot be said to be satisfactorily settled. Remembering the amount of friction caused by the indefiniteness of the French rule, there would be a strong incentive to fix upon a definite one, and it is not unreasonable to suppose that a definite agreement could be reached. France would not be under the same temptation to adhere to her interpretation of her duty as when that interpretation enabled her to render very material assistance to a needy ally. The rule as to coaling, repairs, and internment followed by most of the neutrals during the recent war could profitably be crystallized into a definite rule of law. The rule as to the latter would then be substantially the same in naval warfare as it is in warfare on land, and there seems to be no good reason why it should not be the same.

The Russo-Japanese War has also developed the fact that the limits of the right of visit and search should be more clearly defined. The need of some restrictions upon this right was proved by the acts of the volunteer fleet in the Red Sea. While there is no likelihood of

reaching an agreement to surrender the belligerent right of visit and search. there is a prospect of being able so to restrict the right that it will be far less annoying to neutral commerce. It would certainly not be unreasonable to restrict the area within which the right could be exercised, so that it might not be exercised at a distance of thousands of miles from the scene of hostilities, as was done in the recent war. A reasonable radius within which the right might be exercised could, we think, be agreed upon. The mails carried by regular mail steamships should be exempt from search, as interference with these causes a disturbance to neutrals' business which is out of all proportion to the advantage likely to be derived by the belligerent. News that is of much use to the belligerent is now sent by cable or wireless telegraphy, not by mail. Nor should it be at all impossible to reach an agreement that ships leaving neutral ports in which there were consuls of the belligerents might be examined and a certificate furnished them by such consuls which would be conclusive evidence that they carried no contraband, and would exempt them from search by the belligerent war-There is also need of a more definite agreement as to what are contraband goods. To reach this agreement by the slow process of treaties between the different States will take too long, and the disputes arising in the meantime may result in war. That a complete agreement will be reached which will be good for all time it is useless to hope: but it is not unreasonable to expect that substantial improvement can be made in the direction of greater definiteness. Upon this point the chances are at least sufficient to warrant the attempt.

But of greater importance than revising the list of contraband goods is the establishment of an international court for hearing and deciding upon questions of prizes. At present the situation is this: The belligerents each establish prize courts, and to these the property of neutrals, as well as that of the enemy, is taken for the purpose of determining whether or not it has been rightfully captured by the war-ships of the belligerent whose court is deciding the question.

When we consider the excitement which war always produces, the weight likely to be attached to interests as against abstract justice, and that the judge is virtually an interested party, it is useless to expect impartiality under such circumstances. For, no matter how good the intentions of the judge, he is but human, and it is useless to expect from human nature a character of service for which human nature was never designed. Inasmuch, therefore, as men do not make good judges in their own case, and as patriotic men are too apt to make their country's case their own case, it would seem that it is a mere matter of justice to neutrals that a court be established for the hearing of prize cases, in which the judges in a given case would not be citizens of either the belligerent or the neutral State which is concerned in the controversy. This would be no hardship or injustice to either party to the controversy, and would increase immensely the chances of securing an impartial trial.

There is nothing a priori unreasonable or impractical about such a proposition, and it has justice to commend it. Nor does it seem likely that the proposal would meet with insurmountable opposition in an international conference. States are gradually coming to see that their greatest interests are as neutrals, not as belligerents. And a State would not have the same incentive to oppose the establishment of such a court that it has to avail itself of its present right to establish its own prize courts after it becomes a belligerent and feels, as belligerents generally feel, that its interests and perhaps its national existence are so endangered that it should yield no legal right the exercise of which would be a substantial advantage to it at that particular time. There may be some difference of opinion as to the details of this plan, but that it should be adopted in principle seems entirely clear.

Equally clear is it that there should be, in the interest of neutrals, an agreement as to the restrictions which should be placed upon the right of belligerents to make use of submarine or floating mines. This is a relatively new question, and, though there has been consid-

erable expression of opinion, there cannot as yet be said to be an established legal rule. To argue that the belligerent may sow the seas broadcast with these agencies of destruction, in the hope that the war-ships of the other belligerent may come into contact with them and be thereby destroyed, is to lose sight entirely of the fact that neutral commerce has some rights on the open seas which must not be wholly disregarded. Such an extreme view is highly untenable. what restrictions are to be placed which will at once preserve to the belligerent his legitimate right to injure his enemy and also to the neutral his rights upon the common highway of all nations, is a question in the settlement of which the neutral as well as the belligerent is entitled to be heard. Whether a settlement is reached by way of a compromise or by either side yielding, it is important that a conclusion be reached, so that each side may know the rights of both sides in advance, instead of being compelled to await a settlement of the matter until a controversy forces the question upon them and both are irritated and likely to appeal to the arbitrament of the sword.

There is another standpoint from which this question of the legitimate use of floating or submarine mines may be considered, and that is from the standpoint of the rights of non-combatant enemies. Undoubtedly the belligerent has a right to resort to such means for the purpose of destroying his enemy's fighting vessels, but has he the right to subject the crews and passengers of the merchant vessels of his enemy to such dangers? To answer this question in the affirmative is to disregard the principle that war is a contest between States, and to revert to the theory and practice of barbarism. To one who is convinced that the change in the conception of war as a contest between the armed forces of the contending States, rather than between all the individuals, marks a distinct stage of progress in the laws and usages of war, a reversion to the old conception would be anything but gratifying.

The right of belligerents to destroy neutral vessels instead of taking them in for adjudication has again been raised by the action of Russia in sinking the Knight Commander, the Thea, and the Hipsang. That extreme circumstances may excuse the exercise of so harsh a means of protecting the rights of belligerents has for some time been claimed, conditional, however, upon compensation to the neutral for his loss. was the decision of Lord Stowell in the case of the Acteon (2 Dodson 48) and the Felicity (ibid., 281). But as there is divergence of opinion and practice as to the facts which furnish the basis for the exercise of the right, and as it is contended by some that compensation is not necessary, it is evident that there is need of a definite agreement. Nor is the need of such agreement confined to the question of the right to compensation; it should include also provision for the ascertainment of this by an impartial tribunal. Though it would, of course, be exceedingly difficult, if not impossible, to fix in advance the circumstances justifying the right of destruction, agreement as to an equitable method of redress through an impartial tribunal should offer no insurmountable obstacles. least this much should, therefore, be accomplished.

The use of wireless telegraphy by neutrals in or near the zone of hostile operations presents a new and difficult problem—one concerning which there is need of an agreement for the purpose of avoiding friction and preserving, in so far as possible, the rights of both neutrals and belligerents. Though the pretensions of Russia were entirely untenable that she had the right to treat as spies the newspaper correspondents seized on the Haimun, who were using this means of conveying intelligence,

yet these pretensions serve to show the danger and inconvenience of having no legal provision governing the case.

Scarcely less urgent, though not so new, is the need of determining the rights of belligerents over submarine cables owned by neutrals. This question was raised during the Spanish-American War, when Admiral Dewey cut the cable of the Eastern Extension Company within the territorial waters of the Philippines. This company, which was neutral, owned the cable between Hongkong and Manila. It demanded of the American Government compensation for its loss, and included in this the loss of income during the time the cable was cut. The Attorney-General of the United States replied that neutral property in enemy's territory is, "from its location alone, liable to damage from lawful operations of war, which this cutting is conceded to have been, and no compensation is due for such damage." But this cannot be said to have established a rule. The question may fairly be said to be still an open one, and is worthy the consideration of an international conference, in the hope of reaching an agreement which will be at once equitable to both parties.

We are aware that we have by no means exhausted the list of questions of international law concerning which there is need of a more definite understanding, but we trust that we have called attention to a sufficient number to make it clear that the advantage to be gained by reaching an agreement with reference to some or all of them, and thus removing causes of friction and perchance of war, is ample to warrant the most serious effort of an international conference.

FRANZ SCHUBERT, ROMANTICIST

BY DANIEL GREGORY MASON

SCHUBERT is usually considered to have been the earliest full-fledged representative of that romantic school of composers which succeeded Beethoven. His position in the history of music is thus a peculiar one. He forms the link between two great schools, the classical school of Haydn-Mozart-Beethoven, and the romantic school of Schumann-Mendelssohn-Chopin. Traditions, training, and environment allied him with the older order; but instinct, opportunity, and even native limitation combined to lead him into new paths. He was a born romanticist.

Romanticism is a term of many meanings, standing for a fact of many aspects. For our present purpose, however, we may take it as describing a kind of music the chief concern of which is with special expression, with particular, isolated effects. In classical music emotion is general, pervasive, unparticularized, and sensuous effect is kept everywhere subordinate to the entire scheme of design. Salient, individually conspicuous elements, whether sensuous or emotional, are rare; the effort of the composer is toward a unitary, thoroughly harmonized impression. Romanticism seeks more striking features, even if they are less satisfactorily interfused. Sensuously, for example, romanticism, as practiced by the composers after Beethoven, meant increasing interest in charming effects of color, gained largely either by lavish use of chromatic harmony or by ingenious mixtures of different tone-qualities or timbres, as in the piano writing of Schumann and Chopin, the orchestral writing of Berlioz, and the chamber-music writing of Schu-Emotionally it meant concern with lyrical rather than with epical ranges of feeling, emphasis on each special feeling in all its unique quality rather than on a harmony of all. Structurally, its results were rather negative than positive; it meant here a reversion to simple types of design, a loss of the complexity of organization that had been Beethoven's supreme glory, and a substitution for it of the song-forms of Schubert and the mosaic forms of Schumann. Behind all these changes, as the effective force producing them, stood the desire for increased specialization of expression. Romanticism is thus in essence merely the appearance of the characteristic modern tendency to specialize, to individuate, in the sphere of art.

Schubert's romantic impulse appears primarily in his songs. Before his time the song for single voice, with piano accompaniment, had been a form not favored by the great composers; Mozart's and Beethoven's songs, as some critic has remarked, were merely the chips thrown off in a great workshop. But Schubert took a new interest in the song because he was a new kind of man among composers, a man of sentiment. His temperament was a very pure example of the sentimental type. His music bears all the hall-marks of this temperament—the preference for short pieces, each the monument of a mood: the prevailing ground-tone of tender sadness, frequently irradiated by charming fancifulness, but seldom swept aside by virile passion and energy; the fondness for minor keys, delicious modulations, and persistent, hypnotizing rhythms; the incapacity for logical, sustained The same character is tracethought. able, too, in what little we know of his life. His contentedly ambling, unbuttoned existence, among bachelor friends. in the bohemian world of beer-cellars and suburban picnics; his combination of sweetness and a sort of involuntary nobility of aim with an utter lack of intellectual distinction; his innocence in business matters and practical affairs: his devotion to day-dream and reverie; even his indolence and resulting sponginess of physique, which earned him the nickname of "Schwammerl"—all point in the same direction.

Schubert was the man of sentiment in music; and his songs are the spontane-

Digitized by Google

ous outpourings of such a nature, each an incomparably vivid presentment of a single, isolated feeling, a "moment's monument." And this is precisely what a song should be. As in a short story, of the kind that Kipling, Stevenson, and others have made familiar to us, we do not demand that evolution of character. that complex nodation of plot, that subtle action and reaction of motive, which every great novel must have, but simply vividness, brilliant depiction of a single person, idea, or situation, so in a song we desire no symphonic grandeur of scope and wealth of ordered detail, but rather perfect utterance of a single, highly specialized emotion. Schubert's best songs fulfill this requirement in an almost inimitable degree. Simple in style and design, wonderfully direct, spontaneous, and sincere, conceived as idealizations of the beautiful old German Volkslieder, and carried out with all the artistic perfection and appropriateness of detail that good craftsmanship could give, they are among the few things in music that are absolutely achieved. See, for example, how in such songs as "Hark, hark! the Lark," "Who is Sylvia," "Am Meer," "Du bist die Ruh," "Die Forelle," "Heiden-Röslein," and perhaps a dozen others, Schubert strikes at once, in each case, the exact tone and style needed to transfigure the particular feeling with all the magic of music, and throughout the song maintains the mood perfectly, with no mixture or clouding. And this, too, with the greatest actual diversity of mood in the different songs, to which his art flexibly responds. This group of his fifteen or twenty best songs is not only the crown of his own work, but one of the brightest iewels in the crown of romanticism.

In another group of his songs, even more popular than this supreme one, his romanticism inspired him less happily. Whenever, giving free rein to his passion for detailed expression, he directed his effort less towards reproducing an emotional mood than towards illustrating actual incidents, whenever, that is, he allowed dramatic rather than musical considerations to sway him, he produced a type of song which, in spite of its popularity, is intrinsically inferior, and hence

likely to lose favor as musical taste develops. The most famous examples of this type are "The Erl-King" and "The Wanderer;" others scarcely less known are "Der Atlas," "Die Doppelgänger," "Die Junge Nonne," "Die Allmacht," "Kolma's Klage," and "Hagar's Klage." Such songs, with their physically exciting tremolos, crashing diminished-seventh chords, chromatic climaxes, mysterious staccato octaves, pianissimo, in the bass, and other such claptrap effects, are better suited to accompany the drowning of the heroine of melodrama by the villain than to edify the sense of musical beauty. They reveal pitilessly the seamy side of romanticism. and make us wish that Schubert's fecund imagination had been controlled by a more fastidious taste.

But even after we have set aside such departures from his highest musical ideal as these, together with the several hundred songs in which his simplicity, untouched by genius, degenerated to mere triteness and platitude, we have left, out of the more than six hundred songs he wrote, about twenty or thirty of such incomparable quality as to give him a secure place among the masters of the musical lyric.

The careful discrimination between quantity and quality in Schubert's work, so obviously important in judging his songs, becomes perhaps even more indispensable to criticism when we come to deal with his instrumental works. facts that here present themselves to the intending student on his first approach to the subject are entirely misleading. Schubert wrote, he learns, ten symphonies and twenty string quartets, besides much other chamber and orchestral Remembering that Beethoven, for example, wrote nine symphonies and sixteen string quartets, he is likely to assume that the essential Schubert is to be found permeating the one set of works just as the essential Beethoven permeates the other, and that if he can take, so to speak, a critical average of them all, he will come at the true musical personality of their author. Nothing could be more erroneous. For it must be borne in mind that while the works of Beethoven mentioned were written

during the entire period of his artistic maturity, from his twenty-fifth to his fifty-sixth year, and with the most laborious care, those of Schubert are largely youthful exercises, and were in many cases thrown off as one would write a letter. Schubert wrote voluminously and carelessly, and died at thirty-one, just as he was entering the prime of life. His works are thus, if one may say so, like his person, embedded in superfluous flesh. The bulk of them are, so far as representing him goes, pure surplusage, to be stripped off and thrown aside before we can see the outline and stature of his genius. The compositions produced before the early 1820's, however interesting as documents for the study of his growth, can only confuse a final estimate. The Unfinished Symphony, written in 1822, is almost the first of the entirely characteristic orchestral works, and even that is not free from youthful turgidity and a certain cloying richness of color. The two greatest string quartets, in D-minor and G-major, date from 1826. In 1827 he wrote the two fine pianoforte trios. The great string quintet, and the C-major Symphony, his supreme masterpieces, were composed in 1828, the year of his death. These things reveal the true, the mature Schubert; and only by taking them, and them alone, as the basis of criticism, can justice be done him.

An inspection of the works thus selected as the nucleus and essence of Schubert's instrumental music will reveal, as their most salient character, the same lyrical quality that pervades his vocal compositions. Here, as there, the striking thing is the subjectivity, the strong personal flavor, of the expression. If the songs of the classicists seem often like condensed symphonies, the symphonies and quartets of this romanticist are in many respects magnified songs. In several of his instrumental movements Schubert actually transcribes his themes from songs already written, as for example in the Variations of the D-minor Quartet, founded on "Death and the Maiden," and those of the "Forellen" Quintet, founded on "Die Forelle." When he uses entirely new material, he is apt to conceive it in the lyrical style,

and even to cast it in the lyrical form, with an exact balance of phrases of equal length. Short, musically incomplete and therefore suggestive motives seldom occur to him. The second subject in the Unfinished Symphony, for instance, is like a stanza or strophe; the imagination easily adds words to it; it is an instrumental song. And, like a song, it is complete in itself, not subjected to development. Most of Schubert's more emotional themes share this quality of utterances, and seem, appropriately to their romantic origin and purpose, rather communications of personal feeling than objects of abstract beauty. Even in the later works, like the D-minor and G-major Quartets and the C-major Ouintet, in which the romance is tinged with tragedy, it is still, one feels, romantic tragedy, the tragedy of sentiment and sensibility, and not universal cosmic tragedy like Beethoven's or Bach's.

The interest of the romanticist in color, in richness of the fabric, in the primary sensuous charm of the tonecombinations, characteristic of all the romantic composers, is the source of much of what is most individual in the work of Schubert. He has the keen sense of the impressionist for the varieties of color of the orchestral instruments, and for their effective combination and opposition. He knows how to make the oboe acid, sultry, or menacing, the clarinet mellow and liquid, the horn hollow, vague, mystical, the 'cellos passionate, and the violins clear, aspiring, and ethereal. The score of his C-major Symphony is a marvel of ingenuity and felicity in the weaving of various colors and modes of playing, as staccato and legato, pizzicato, etc. Look, for instance, at page 162 of Eulenberg's miniature score, and see how the woodwind instruments chatter in staccato against the long rise and fall of the strings playing in octaves, legato; or at page 139, noting how, after a powerful climax and a moment of complete silence, the 'cello, against plucked chords by the other strings, sings a languorous melody, which is presently taken up by the oboe; or at pages 30-35, where, under the shimmering veil of the strings, the trombones gradually work out their

sinister call, rising ever higher and higher, and finally precipitating all into the sounding turmoil of the climax on page 36. In such passages as these every tone sounds; and all the tones unite harmoniously and co-operatively to produce the intended effect. In few scores will one find at once such richness and such clear transparency of tone-fabric

Nor is Schubert dependent for variety of color, as unimaginative composers are, on the richly diversified palette of the full orchestra. His chamber-music shows what wizardry he can accomplish with limited means. In his two trios, op, 99 and 100, by making the most of the percussion quality of the piano as well as of both the pizzicato and the sustained tones of the strings, he evolves a surprising variety from the three instruments. Even with the string quartet, the most monochromatic of chamber combinations, he achieves great differentiation and contrast, largely by rhythmically individualizing each voice. opening of the A-minor Quartet is a good example: viola and 'cello give a drone bass in a peculiar and striking rhythm (a dotted half-note followed by a group of four sixteenths); the second violin holds the tone-mass together by means of a graceful, legato, running figure in eighth-notes; the first violin sings a melody that follows its own free and untrammeled rhythm. One is reminded by such a passage of Dvořák, who is of close artistic kin to Schubert. Both men secure fascinating texture, in their writing for strings, by opposing many diverse rhythms simultaneously. The device has been assailed as being a mask to cover a poverty of real polyphony (inner melodiousness); but though it may to a certain extent be that, there can be no doubt of its sensuous effectiveness.

Another similarity between Schubert and Dvořák, also indicative of their romantic interest in special, momentary features, is their coloristic use of harmony, and especially of modulation. Sudden transitions to remote keys are no commoner perhaps in Schubert than in Beethoven, but in Schubert they are prompted by considerations of color rather than of design. Like Dvořák, he loves un-

expected recrystallizations of tone. He shakes the kaleidoscope of his fancy, and all the bits of glass fall into a new pattern (tonality). Such a fascinating change as that immediately after the forte chord of D, in the second entre-act of "Rosamunde," is an illustration. Even better ones, because showing so clearly the lack of any element of formal design in these changes, are those casual alternations of major and minor mode which are so frequent as to constitute a mannerism. At the close of the first movement of the G-major Quartet is an extreme case. Four measures consist entirely of abrupt alternations of the major and minor tonic chords, with no melodic binding together. This is obviously purely a "color-effect," and its motive is of course unequivocally romantic.

The chief faults of Schubert's instrumental works—and they are grave ones -result in part from his way of composing and in part from the insurmountable opposition between the lyrical expression native to him and the modes of construction suitable to extended movements. Schubert was an easy-going, careless, and indolent writer. He wrote music as most people write letters; often he would scribble off half a dozen songs in a single day; he thought nothing of making an overture in three hours, or a whole operetta in a week; and to a friend who asked him how he composed, he replied, "As soon as I finish one thing I begin another." What all this means, practically, is that he did not "compose" at all in the strict sense of placing together tones with care and forethought, but merely improvised on paper. And as a result, while he certainly attained a delightul spontaneity of effect, he also fell into the pitfalls of monotony and diffuseness. constantly becoming hypnotized by a rhythm, keeping it up relentlessly, page on page, without relief. When he has once hit upon a phrase that appeals to him, such, for example, as the second subject in the G-major Quartet, he is apt to adhere to it pretty closely through a whole section of the piece. Such insistence, in contrast to the variety of phraseology of composers like Mozart,

is comparable in effect to the singsong couplets of Pope or Dryden, as contrasted with the pliant versification of Shelley. This weaker aspect of Schubert, connected with his lack of intellectual vigor and possibly with a certain flabbiness of moral fiber, has been exhaustively discussed by Mr. H. H. Statham, an English critic, who reaches the conclusions that "in music, as in literature, easy writing is hard reading," and that in Schubert's larger pieces "lovely melodies follow each other, but nothing comes of them." Whether or not we agree with so extreme a view, we cannot deny Schubert's weakness in musical construction.

But the defects here considered spring in part, it may be pointed out, from the very nature of the musical ideas dealt with. Most of Schubert's themes, even in quartets and symphonies, are essentially songs. Now, it is the nature of a song to be complete in itself, a single vivid presentation of a special emotion. Hence a song is essentially unfitted to the thematic development that short, emphatic, pregnant motives so obviously permit of and require. When, therefore, Schubert comes to the end of his songlike theme, he finds little to do, if he would go on, but to repeat it, with new coloring or accompaniment, or to write a new theme, also very likely lyrical. As a matter of fact, we usually find in his music five pages of repetition to one of real development. Mr. Statham is quite right in contrasting the "vain repetitions" in the Andante of the C-major Symphony with the logical evolution of matter in the Allegretto of Beethoven's Seventh Symphony. And even where, as in the fine coda of the Finale of the C-major Symphony, Schubert has a truly broad design to work out, he fills in his detail in the easiest, least exacting way, by repeating identical phrases at a higher and higher pitch. The effect of the long, gradual climax is intensely dramatic, but when upon familiarity we realize that the ideas generate, so to speak, by fission, or exact reduplication,

rather than by organic evolution, we are left æsthetically unsatisfied. The truth seems to be that Schubert, being essentially a lyrical writer, makes beautiful symphonies and quartets in spite of, rather than by means of, the natural conditions of these epic musical forms. His symphonies are expanded songs, delightful, as songs are delightful, for their directness of feeling, their beauty of detail, their warmth of color and sensuous charm.

His last work, however, the great C-major Symphony, has enough of the heroic about it to make us cautious in saying what he might or might not have done had he not died at thirty-one, when he was just entering the period of artistic maturity. There is a grandeur of scale and intention, a deliberation and solidity, a sustained power, large touch, and freedom of execution about this symphony that place it above all his other works. The long climaxes bespeak a reserve power not associated with Schubert the song-writer; the themes wear their possibilities less upon the surface, and unfold them more cumulatively; the harmony is firmer, plainer, and stronger; the scoring is done as it were with a larger brush, the colors laid on in wider spaces and bigger patterns; and in the last movement the romantic note is for once well drowned in a deeper cry of tragic heroism. It is not a mere coincidence that the theme at the beginning of the Development section so strongly suggests Beethoven's Hymn of Joy; the spirit here is Beethoven's, and the spaciousness of the scheme of construction, if not the detail with which it is filled in, are worthy of the greatest symphonist. Here surely the graciousness of childhood and the romantic dalliance of youth are laid aside, and Schubert speaks with the deep, deliberate voice of manhood. Death never came to an artist more untimely. Had he lived, we cannot tell what new and even profounder expressions of the ripe earnestness that lies beyond romance he might not have planned and achieved.

RELIGIOUS AND MORAL TEACH-ING IN THE SCHOOL'

BY WALTER L. HERVEY

THE whole matter of the religious and moral side of public education is so vital and yet so vexed, so clear and definite in respect of general aim and so befogged and vague in respect of means, that while it emphatically needs to be threshed out, it is very difficult to treat in a way satisfactory to all parties concerned, and impossible at present to settle finally. There are probably few persons who would not agree that the common schools should have some share—and a very considerable share—in religious education. But when it comes to defining just what is meant by religious education, and determining just what share in it properly belongs to the common schools, grave difficulties and disagreements at once arise. And as for moral education, the fact that a bill was recently introduced into the New York Legislature making mandatory in the schools of the State the teaching of ethics, under penalty of withdrawal of the public funds, shows how seriously the question of moral training is regarded by the public, how gravely it may be possible to err if resort be had to external mandatory measures, and how urgently there are demanded from those within the schools a clearly defined position, a working programme, and, above all, such palpably effective results as shall defy just criticism.

It is significant that religious and moral teaching should be so often lumped together. Very early in our history as a Nation it was proclaimed that "religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." And it is now commonly agreed that while religion and morals are, for purposes of clear thinking, neces-

sarily to be distinguished, in education, as in life, they are "inextricably involved." The highest form of religion issues in human service; the highest form of morality invokes the aid of the Infinite; and in the public school we should have no use for a lower form of religion or of morality than the highest.

But for purposes of thought we must, as I said, divide them, and so I shall first consider what, if any, teaching of religion is possible or necessary in the elementary public school. The only wise answer to that question is, in my judgment: The formal teaching of religion is impossible and unnecessary in the elementary public school. By the formal teaching of religion I mean all direct and explicit teaching of doctrine, dogma, creed, tenet, or belief concerning Bible, church, God, Christ, devil, angel, prayer, penance, immortality, heaven, hell, purgatory, sacrament, pope, bishop, priest, nun, or deaconess, or any like matter. Such teaching is, in the United States, legally impossible. But even if it were possible legally, it would not, in my judgment, be possible morally or professionally. The formal teaching of religion is the deepest and most delicate of all kinds of teaching. It requires on the part of the teacher the greatest skill, judgment, and wisdom. In such work the view-point is vital; selection and emphasis are vital; the turns of expression and the imagery back of the language are vital. Your way in these things is not my way, and still less is it the way of the teacher under whom your child happens to fall from year to year in the public schools. You and I differ so radically in temperament, heredity, and modes of conceiving that, without mutual consent and agreement, neither of us would be willing to instruct the child of the other in religion. Are we then to permit, without the possibility of specific agreement or consent, our children to be instructed in element-

¹ From a paper read before the Department of Elementary Schools of the Religious Education Association

ary theology by a teacher in the public school, whose views, imaginations, and convictions in such matters differ from those of us both? And should we require that teacher to do for our children what we would be unwilling ourselves to do for others' children? I put the point personally, for it is at bottom the most intimately personal question with which we can possibly have to deal. And I believe that Professor Paulsen hits the nerve of the matter when he concludes his discussion of religious education in these words: "What can we do to preserve the religion of the people? I am sure I do not know, unless it be that when you consider the question of preserving religion you first think of yourselves.

But even if it were possible to make the schools more formally religious and less untheological than they now are, it would not be necessary to do so. First, because such instruction can be given outside of the schools without loss, and even with positive gain. And, secondly, because the public schools can meet every legitimate and reasonable tlemand for religious teaching without such instruction. It is an abuse of language to say that because the public schools do not explicitly teach the existence of a God they are therefore "godless," and to affirm that because they do not teach anything about Christ and the Church they are therefore unchristian, and to imply that if they do not teach ethics they are therefore im-There is a vital distinction to moral. be made here—the distinction between "knowledge about" and "acquaintance with;" between the imperfect, controverted, misleading utterance of the lips and the vital experience of the soul; between ethics and morality, theology and religion. Is it to be supposed that there is no religion where there are no phrases, or that there is no recognition of God except by verbal acknowledgment in set terms, or that there is no danger of loss in "raising God from that region where he is clung to by the whole soul with all its spontaneous energy and conferring on him the honor of exactly demonstrating his existence"? Pestalozzi beautifully distinguishes between the

direct and the indirect method when he says of Gertrude: "She taught the child about his ear, not by saying, 'This is your ear,' but by saying, 'Now, child, I will wash your little ear.' "Similarly, I should not particularly care to have my child formally told at school, "There is a God." But I should think it a strange school indeed in which there would not be many times heartfelt and vital recognition of the fact.

In reply, then, to the question, What is the content of formal religious instruction in the elementary public school? we answer, Nothing. But in answer to the question, What is the real content of religious teaching? we answer, Every-There is no subject in the curthing. riculum, there is no relation in the life of the school, which is not packed with potential divinity and may not make for morality. Each study and each experience has its roots in the infinite, and this basic fact may be felt, may be seen, may be lived, without formal instruction The essential principles of therein. Christianity—the fatherhood of God, human brotherhood, the infinite worth of a man, loving service, the abundant life—all these can in every school-room be lived, felt, and with increasing clearness known, without claims, without formal credit, and without the inevitable controversies that spring therefrom.

When we stop to think of it, it is precisely of this living experience that there is deficiency, and of claims, credit, and controversy that there is excess. Whatever may be the function of other educative agencies as regards religion, it is the function of the public school to supply the materials and the occasion of a rich and real religious experience. If it do this well, it will, as far as religion is concerned, have done enough. How can it do this?

Let me answer this in the first instance by an example. I wish that those who decry the schools as godless and as fadridden could, on a certain occasion, have visited with me one of the schools of a great city—a city where the problem of building character, of molding American citizens out of the most heterogeneous and apparently unpromising materials, is met with in its acutest

The school was not an ideal one. form. The teacher in charge was not an ideal person to be in charge of moral and religious instruction. The children were of many nations and of many sects. If one were obliged to commit to any teacher the task of the formal religious instruction of such children, one might well tremble at his responsibility. But listen! There is the reading of a Psalm without note or comment. There is the soul-stirring and tremendously earnest salute to the flag, which by its dignity suggests a sacrament, and which, to those who look on and who know what the flag means even to those children, is a most solemn and moving spectacle. And then there is the singing. visitor is impressed with the manner of singing—in soft, pure tones (for there is a vast difference, from the view-point of moral and religious training, between singing and physical shouting, and that difference is appreciated by the director of music). And still more impressive is the matter sung. It is what might be, if written in prose and said instead of sung, an extract from a revised shorter catechism. The refrain, often repeated by the sweet childish voices, is still singing itself in my ears-" God is wisdom, God is love; God is wisdom, God is love."

So long as such informal religious teaching and such real religious experience are found in the schools unchallenged—and no one was ever known to challenge such exercises, except, perhaps, as fads—the public schools cannot justly be called "godless," "irreligious," "madly perverted," "enemies of Christ," senders forth of "a lusty set of young pagans."

But the public schools can also provide the materials of a rich and real religious development through the subjects of instruction. First, by nourishing and cultivating the spirit of wonder, and the reverence which is the child of wonder. Any study, generally speaking, whether it concern man or nature, which leaves the mind self-satisfied at being able to see clear through the subject, and of knowing all there is to be known about it, is ill taught. Secondly, by cultivating the sense of dependence, of imperfection, and, naturally, of humility.

All nature rightly studied is one continuous lesson in dependence; nothing selfsufficient, nothing causeless, nothing fully explained. All study of man has also its side of dependence. We find this expressed nowhere more wonderfully than in the Psalms, but we do not have to go to the Psalms to find its expression. The words and acts of Washington, Lincoln, and of many another great man in the presence of overburdening responsibilities, irresistibly, and in ways too deep for words, teach the lesson of dependence. Thirdly, by nourishing and cultivating the sense of spiritual mastery, which in its highest form finds expression in the words of Jesus, "I have overcome the world," but which in kindred forms appears in the life of every one who plays the man, however unconscious he may be of the source of his power. For it is not given to any one to play the man except by the power of God; and no one can himself play the man, or enter into the experience of one who does, without coming closer to the source of infinite power. The realization of this source as source is secondary, not primary, just as a person first falls in love, then discovers that he has fallen in love.

Wonder and reverence, dependence and humility, spiritual mastery and faith—to nourish and exercise these is as truly the work of the school as to prepare for the care of the body, for wage-earning, for voting, for rearing a family. And it is possible to provide that nurture and exercise without adding a single subject to the present curriculum of the common schools.

Before leaving this part of my subject I wish to call attention to the fact that the problem of religious education is by no means identical, though sometimes confounded, with that of the proper use of the Bible in the public schools. Nothing that I have said can properly be interpreted to mean that the Bible, intelligently and judiciously used, may not and should not be employed as an invaluable instrument of public education.

The cry for more effective moral instruction in the schools, and for a better moral output from the schools, is

waxing more and more insistent. It is pointed out that crime is on the increase; that the ratio of criminals in the United States has risen in forty years from one in three thousand to one in seven hundred; that in the United States the number of murders increased in the ten years from 1886 to 1896, from 1,146 to nearly 14,000; that, in general, the moral strength of the present generation is unequal to the moral over-strain of our modern life. The blame for it all is, by some who write to the papers, placed on the public schools; and while it is manifestly unfair to place the whole blame for imperfect education on only one of the many educational agencies, it must be admitted that the public schools are in some measure responsible for the present gravely unsatisfactory and disturbing conditions. Granting this heavy and unshirkable responsibility of the schools, what is to be done?

At the outset it may safely be affirmed that the problem is one that does not admit of a rough and ready solution. The proposals of those who would settle the whole trouble by passing a law or by teaching commandments are pitifully ineffective.

Of serious and reputable theories for the teaching of morality there are two general types, corresponding to the two ways of teaching religion; namely, the formal teaching of ethics, and the informal inculcation of morality. On the one hand, Professor Felix Adler and his co-laborers, whose words and works are worthy of the most profound respect and careful study, hold that incidental. teaching does not suffice; that it deals with the negative rather than with the positive aspect of morality; that the incidental method in morals is as faulty as is the incidental method in geography or spelling; and, above all, that the systematic method is practicable, for it has been and is being successfully employed. The accounts of the formal instruction in ethics successfully carried on for many years in the Ethical Culture Schools of New York, and the accounts of similar work done in Anderson, Indiana, under Superintendent J. W. Carr, are worthy of the most careful attention. But the work of these experiment stations

has brought out in stronger relief the difficulty and delicacy of the task of formal ethical instruction; it has clearly shown that such instruction should not be undertaken without the most careful preparation on the part of the teacher.

On the other side, it is vigorously contended, notably by Professor George H. Palmer (Forum, 14: 673), that the attempt to secure morality by instruction is not only futile but pernicious; that behavior can no more be taught by rule than can correct speech, and that the attempt to do either results in demoralization. The two great means of moral education are individuals and institutions—the former working by example, the latter through that "unnoticed pressure of a moral world" which it is their special function to exert.

It cannot be doubted that most American teachers occupy a place between these two extremes, but nearer the latter than the former. And it is well that such is the case. The formal or systematic teaching of ethics in the elementary school, even though it prove desirable, is not at present to any extent practicable. The teachers are not now able to teach it, and they will not soon be able to do so. The dangers of mere textbook ethics in the schools cannot be overestimated. Meanwhile, and indeed in any case, the mainstay of characterbuilding and moralization must, so far as the elementary school is concerned, be sought and found in the means already at hand: in the personal character of the teacher, in such a choice of the subjects of study and such methods of teaching as will produce a "responsive respect for institutions" and cultivate social imagination, and in such an organization of the school as will give the fullest play to social forces.

This view appears to be embodied in the "Syllabus on Ethics" which has been adopted for the public schools in the city of New York. Parts of this syllabus are here given as indicating the lines on which, by many thousands of teachers, the problems of moral education are being worked out in the classrooms of a great city system:

It should be the aim of every teacher to make each part of the life of the school

count for moral education. This aim should be present not only in formal instruction and training, but also in the general atmosphere and spirit of the class-room and of the school. In working toward this aim the following suggestions, based on the experience of practical teachers, will be found helpful:

1. The personality of the teacher is at the root of all moral education in the school. The teacher's ideals, sincerity, poise, selfcontrol, courtesy, voice, manner, dress, and

general attitude toward life are potent forces for character-building.

2. Reverence is vital to morality. Whatever quickens in children the feeling of dependence on a Higher Power, whatever leads them devoutly to wonder at the order, beauty, or mystery of the universe, whatever arouses in them the sentiment of worship or fills them with admiration of true greatness, pro-motes reverence. There is no subject studied in school which, reverently taught, may not yield its contribution to this feeling.

3. Self-respect, which is also fundamental to moral development, is engendered in a child when he does his best at tasks that are worth while and within his power to do well, with proper recognition by teacher and

schoolfellows of work well done.

 The corner-stone of a self-respecting character is principle—the will to be true to the right because it is right, whatever the consequences, to act "with firmness in the right as God gives us to see the right." The essential difference between principle and mere self-interest should be vividly brought home to each child.

5. The spirit of the class-room and of the school—the spirit that makes children say with pride "my class" and "our school" is one of the strongest of moral forces. Where there exists a proper esprit du corps, the problem of discipline is largely solved.

Public opinion as a moral force should be molded and utilized in every school.

6. The child should early gain the idea of social membership. The truth that co-oper-. ation and unselfishness are essential to true social living should be made real and vital. This truth is brought home through "group work," where the work of each is necessary to the work of all; and through the feeling in a school or class that the honor of all is in the keeping of each.

The child should also learn that he is a member, not only of the school, but of the family, of the neighborhood, of the city, and of the State and Nation. The meaning of loyal membership of these social institutions should be made clear. The naturalness and the necessity of obedience and helpfulness The moral aspect of home should be shown. tasks and of working with and not against the departments of health, street-cleaning, police, and education, should be enforced by concrete applications. In general, the truth should be impressed that without loyal and effective social membership no individual can wholly live.

7. No person has a fully developed moral

character until there has been a transfer of the seat of authority from without to within himself: a moral man obeys himself. Each child in every grade should be steadily helped towards self-direction and self-government. Effective means to this end are: appeals to initiative and resourcefulness; the development of such a sense of honor as will preserve order without surveillance; and some form of organization designed to quicken and exercise the sense of responsi-bility. The "school city," when wisely applied and shorn of unnecessary machinery, has been found effective in many schools. But the form of the organization is immaterial. The essential point is that the teacher himself a member of the community, should make his pupils sharers to a certain extent in the problems arising out of their com-munity life; and that he should intrust to them, as members in their own right of the social body, the performance of certain func-

9. In connection with the regular studies of the school, certain aspects of contemporary civilization which are of value for developing the social spirit should receive atten-tion. Hospitals, societies for the prevention of cruelty to children and to animals, homes for orphans and for the aged and infirm, fresh air funds, and similar agencies for social service, should be brought within the child's comprehension at the proper stage. Deeds of heroism and self-sacrifice done by firemen, policemen, soldiers, inventors, and persons in the ordinary walks of life should be presented and dwelt on. The truth that success in life means more than mere money getting can thus be brought home again and again. The contemplation of deeds of cruelty, dishonor, and shame has a necessary, though subordinate, place in molding moral

11. In all such moral instruction and guidance the following principles should be observed: (a) the course of moral training is a

development. . . . (b) The culture of the imagination is a powerful aid in moral instruction; first, as the power vividly to picture consequencesto put yourself in your own place later on (foresight); secondly, as the power to "put yourself in his place" (social imagination, sympathy).

(c) In using literature and similar material for purposes of moral education, the teacher should not violate the law of selfactivity. The child properly resents having a moral drawn for him which he could draw for himself, and he is the more likely to follow the principle which he himself discovers or

formulates, because it is his own.

(d) The most effective method in moral education is positive rather than negative. A mind filled with good interests, high ideals, and helpful activities has no room for evil. Love is a stronger and a better motive than

IBSEN'S LETTERS'

"HOSE who read Ibsen's "Brand" for the first time are apt to feel as if they had been plunged unexpectedly into an icy bath. The sensation is invigorating, but far from pleasant. Other writers pay the conventional deference to sentiment; but here is one who will have none of it, or who at least will not allow its claims when it comes into conflict with either duty or justice. So the passionate idealist who is the protagonist of the mighty drama sacrifices in turn home, friends, wife, and child, straining his heartstrings to the breaking point, but assured that his lofty-purpose requires the sacrifice, and inflexible in the determination to let no emotional weakness impede its achieve-His austere example has so little in common with ordinary humanity that it is hard to adjust our sympathies into consonance with his actions, or to realize that those actions are the inevitable expression of his character. But the prophets, from Jeremiah to Carlyle (and surely the author of "Brand" is numbered among them), have always preached uncomfortable doctrines, and have had, moreover, a way of forcing acceptance upon their own terms.

One frequently thinks of "Brand" when reading the recently published Ibsen letters. One thinks of the drama when he reads with what feverish energy it was written, how the author was "indescribably happy," feeling "the exaltation of the crusaders," during its compo-And one thinks of its central figure when he comes upon certain intimate revelations of the author's own personality. For he, too, like Brand, had made sacrifices for his ideals. He had separated himself from home and friends, not through hardness of heart or lack of sensibility, but because he felt that he had a mission, and for the accomplishment of that mission he must free himself from every sort of bond that might hamper his liberty of thought and action. "Friends are an expensive luxury, and

when a man's whole capital is invested in a calling and a mission in life, he cannot afford to keep them. The costliness of keeping friends does not lie in what one does for them, but in what one, out of consideration for them, refrains from doing." "I know it to be a defect in me that I am incapable of entering into close and intimate relations with people who demand that one should yield one's self up entirely and unreservedly." "It is not for a care-free existence I am fighting, but for the possibility of devoting myself to the task which I believe and know has been laid upon me by God-the work which seems to me more important and needful in Norway than any other, that of arousing the nation and leading it to think great thoughts." "I have not the gifts that go to make a satisfactory citizen, nor yet the gift of orthodoxy; and what I possess no gift for I keep out of. Liberty is the first and highest condition for me." These fragmentary extracts from the letters help us to understand how fully, when he wrote "Brand," Ibsen put himself into the work. Speaking of other plays, he claims the dramatist's prerogative of objectivity, asserting the author to be a mere outsider; but "Brand" is essentially the embodiment of his own character, and, as such, is the most vital figure of his entire creation.

There is no use in having a mission unless a man fits himself for its fulfillment. Consequently, in a very real sense, the first duty of the altruist is to himself—to develop and strengthen his own personality in order to make of it the most effective agency for the shaping of the lives of others. This is Ibsen's constant teaching (as it was Goethe's), and the failure to recognize its importance has caused many a fine altruistic impulse to have no further outcome than vague and ineffectual aspiration. Viewed in this light, how deeply significant is the following confession: "Everything I have written has the closest possible connection with what I have lived through, even if it has not been my own personal experience; in every new poem or play I have aimed at my own spiritual

Digitized by Google

¹ Letters of Henrik Ibsen. Translated by John Nilsen Laurvik and Mary Morison. Fox, Duffield & Co., New York. \$2.50, net.

emancipation and purification—for a man shares the responsibility and the guilt of the society to which he belongs." And how unassailable, rightly considered. is this dictum: "So to conduct one's life as to realize one's self—this seems to me the highest attainment possible to a human being." Just as the economic ideal of enlightened self-interest is widely removed from selfishness in its vulgar meaning, so is this ethical ideal of enlightened egoism a thing totally different from that blatant self-assertion and roughshod disregard for one's fellows which the term egoism commonly connotes.

In writing about Ibsen one seems, somehow, to have little use for the conventional jargon of literary criticism. This is true even of the discussion of his plays: it is still truer of the discussion of this volume of his correspondence, written under many varying conditions, and without the least thought of its appearance in print. It is frequently occupied with large ideas, and those ideas are not, as a rule, rigidly fixed, but are rather in the process of crystallization. Ibsen's notions of the State, of the organization of society, are of singular interest, because we can trace the successive stages of their development. He did not find it easy to harmonize the robust individualism which was the strongest of his prepossessions with the actual facts of history as he saw it in the making. He constantly inveighed against regimentation, against the system which reduced individuals to mere cogs in the socia! machinery, yet he could not but admire some of its results. And the bitterness of soul that drove him into voluntary exile in the sixties was occasioned more by the unwillingness of the Scandinavian kingdoms to take united action against Prussia than by anything else. conquest of the Danish provinces seemed to him the most intolerable triumph of brute force over right, and he could never allude to it without emotion. is how he expressed himself at the time: "I cannot keep myself from dwelling with sadness on the situation at home; nor was I able to do so during my whole journey. If I had stayed longer in Berlin, where I saw the triumphal entrance

in April, with the howling rabble tumbling about among the trophies from Dybböl, riding on the gun-carriages, and spitting into the cannon—the cannon that received no help and yet went on shooting until they burst—I do not know how much of my reason I should have retained." The impression of power, although of power put to sinister uses, that remained from his recollections of what Holger Drachmann has called the Danish Thermopylæ, was deepened by his observation of the Franco-Prussian War, and he realized how great a thing was the national discipline that created out of that conflict the German Empire. He summed it all up when he wrote to Brandes: "I began by feeling myself a Norwegian; then I developed into a Scandinavian; and I have ended in Teutonism." But this submission to the logic of events never reconciled him to the German State-system which had accomplished such wonders, for that was impossible to his individualistic, almost anarchical, temper. He felt little faith in revolutions or other political upheavals, because he thought that they affected only the form of society, and were not brought about by spiritual forces. In his impatient mood he could say, as he did in a famous poem, that the deluge was the only thoroughgoing revolution in recorded history, suggesting that it needed but the finishing touch of "a torpedo under the ark." But in his more philosophic mood he always had before his vision the coming "third kingdom," mystically foreshadowed in "Emperor and Galilean," which should somehow reconcile the individual with the State, according to each its proper sphere of freedom.

Those who see only the destructive aspect of Ibsen's genius, only the corrosive effect of his social criticism, do him the greatest possible injustice. They call him a pessimist, whereas he is neither a pessimist nor an optimist, but simply a pronounced meliorist. In his diagnosis of evil the remedy is always implicit, and is often distinctly prescribed. Nor does he pose as a rigid dogmatist. Nothing is more noticeable in his letters than their revelation of the gradual shaping of his ideals. He is of the

party of progress, but he works out its programme slowly and painfully. Thus, he wrote to Brandes in the eighties: "Björnson says, The majority is always right.' And as a practical politician he is bound, I suppose, to say so. I, on the contrary, must of necessity say, 'The minority is always right.' Naturally, I am not thinking of that minority of stagnationists who are left behind by the great middle party which with us is called liberal; but I mean that minority which leads the van, and pushes on to points which the majority has not yet reached. I mean, that man is right who has allied himself most closely with the future." And here is another passage of about the same date that must go with the one just quoted: "I maintain that a fighter in the intellectual vanguard can never collect a majority round him. In ten years the majority will, possibly, occupy the standpoint which Dr. Stockmann held at the public meeting. during these ten years the Doctor will not have been standing still; he will still be at least ten years ahead of the majority. He can never have the majority with him. As regards myself, at least, I am conscious of incessant progression. At the point where I stood when I wrote each of my books there now stands a tolerably compact crowd, but I myself am no longer there; I am elsewhere; farther ahead, I hope."

It is difficult to overstate the interest of this collection of Ibsen's letters. They cover his whole active life, and thus provide a fair substitute for the autobicgraphy which he once began, but did not carry very far. The letters are to a large number of persons, and there are fairly continuous series to the three closest friends of the writer-Björnson, Brandes, and Frederik Hegel, the head of the ancient and famous Gyldendal publishing house. They cover a great variety of subjects, and thus give us a sort of index to Ibsen's inner life-something particularly needed in the case of an author who has chosen to work chiefly in the dramatic form of expression.

Comment on Current Books

It is a gloomy view of society The Cost of that Mr. Sidney A. Reeve Competition takes in this original and rather sensational contribution to the literature of ethics and economics. The task of pointing out defects in the social fabric is by no means difficult, but it does not follow that the modern organization is so essentially unsound that reforms can be effected only by changes amounting to revolution. Nowadays, however, there seem to be many who incline to this belief, and Mr. Reeve is emphatically one of their number. The aim of his volume—an imposing treatise of more than six hundred pages—is to prove that the ills from which the body politic suffers have their root in competition, and that the hope of the future lies in the total elimination of competition. His programme is distinctly socialistic, and has for leading features the vesting of the "ultimate ownership" of all capital in the community, the abolition of "capitalism" and "landlordism," and the fixing of prices by a "public central office." Just how society is to be induced to accept the institutional changes involved is not made clear, but we are warned that, so far as the United States is concerned, action

must be taken quickly, in fact before 1909. Suggestive and informing in some respects, it is hardly likely that Mr. Reeve's book will induce any wide acquiescence in his propositions and proposals. The economist, concerning whom a good deal that is disparaging is here said, will not be hard put to expose the fallacies underlying the structure so laboriously erected, while the "non-technical" reader is likely to beat a hasty retreat before the heavy artillery of mathematical formulæ with which the argument is supported. (McClure, Phillips & Co., New York. \$2, net.)

It is not necessary to accept George the estimate of Mr. Shaw Bernard Shaw which Mr. Henry L. Mencken places upon him in this volume in order to get some value out of his arrangement of Mr. Shaw's plays, and the opinion which he gives regarding them. There is a good deal of the slapdash method of Mr. Huneker in these brief chapters; but, since Mr. Shaw seems to affect all the writers who try to deal with him with a sort of midsummer madness, those readers who are in search of information must be content to take it as it is offered to them, and discard the foam and

fury with which it is enveloped. (John W. Luce & Co., Boston. \$1.)

As a critical work History of Early upon the writings of Christian Literature the New Testament this volume by Dr. von Soden, of the University of Berlin, has eminent and substantial merits. It is free, and at the same time well balanced. It is lucid, and sufficiently untechnical to be helpful to the average Bible student. The mediating position taken by von Soden in regard to the Johannine literature deserves a consideration for which present limits are inadequate. The eccentric theory of van Manen and others, which assigns the entire Pauline literature to the second century, receives here a conclusive refutation. Except the Pastorals, Ephesians, and Second Thessalonians, all the rest of it is pronounced genuinely Paul's, and is reckoned as fully equal, if not superior in the higher qualities of literature, to the great classics of Greece. The historicity of the Evangelic Tradition, whose main outline is thus carried back to within a quarter-century of the Crucifixion, may be regarded as established beyond gainsaying. (G. P. Putnam's Sons, New York. \$1.50.)

This work by the Rev. Archi-The Holy bald Campbell Knowles, of Christ-Child the Anglican Church, will be admitted to be "a devotional study of the Incarnation of the Son of God," but scarcely more than devotional. Theologians, as Professor Briggs says, prefer to view the incarnation from the standpoint of "the Hymn of the Logos (John i. 1-18)," while the favorite popular conception of it is that of the "Ave Maria." Mr. Knowles adopts this popular conception so thoroughly that he cannot see how God could become incarnate except through a virgin birth; denial of which is to him denial of the incarnation. Yet it is doubtless true, as he says, though in a meaning far above his thought, that denial or distortion of the truth of the incarnation leads to the wrecking of many a human life. "Creation," traditionally so called, is the incarnation of the divine in the human. "We are the offspring of God," said St. Paul to pagans. As for the prodigal in Jesus' parable, it is a saving thought for a sinner to realize whose child he is. (Thomas Whittaker, New York. 90c., net.)

Canon Ainger was not only Lectures and one of the best and most tact-Essays ful of Lamb's editors, but he was also a good all-round literary scholar and a persuasive and agreeable writer. Under the pressure of his work as Master of the Temple it was impossible for him to keep

digging away at the sources of literary knowledge, but his acquaintance with authors was ample, and he had a talent for using knowledge which is often denied investigators. The two volumes which contain his "Lectures and Essays" show wide reading and catholic tastes; they include papers on Shakespeare, Lamb, Swift, Burns, an interesting if not wholly convincing discussion of euphuism, and a charming chapter on Tennyson. Canon Ainger was an appreciator of the humor of Dickens, and has happily characterized it. The three lectures on Shakespeare's art are excellent examples of what is called popularization of knowledge, but what is more truly the interpretation of the growth of an artist by the study of his work. The two volumes will not take rank as permanent additions to the literature of the English essay, but they form most agreeable reading; for they are work of a man of cultivated intelligence, of broad tastes, of genial humor, and of old-fashioned literary manners. (The Macmillan Company, New York. \$5.)

Students of French his-

Louis XIV. and La Grande

tory who three years ago welcomed the publication Mademoiselle in English of the first part of M. Arvède Barine's "La Grande Mademoiselle" (1627-1652) will have a special welcome for its successor, which carries the story to 1693. The first volume presented conditions in France during a period in which the ancient liberties of the people had suffered extinction. The present volume throws additional light upon the person popularly supposed to have had much to do with that extinction-Louis XIV. "La Grande Mademoiselle," his cousin, had been brought up side by side with him, but she seems to have been as ignorant of his real character as was St.-Simon, his memoirist. There was indeed some excuse for St.-Simon: Louis XIV. was over fifty years old when the redoubtable writer appeared at Court; thus the "Mémoires" present a portrait of a man almost venerable, and this is the portrait which has come down to us rather than any other. In the present volume we have a somewhat different one; in fact, here and there we are reminded of that possibly fanciful portrait of the monarch as he appeared in his younger days which Dumas the elder drew. A marked value of M. Barine's volume to all those who would understand the age of Louis XIV. lies in the fact that "La Grande Mademoiselle" was a thoroughly representative figure of her generation. She possessed the great qualities of a great epoch, but she was also responsible for some of its evil, intolerance, and oppression, by the results of which she herself was finally

overwhelmed. (G. P. Putnam's Sons, New York. \$3, net.)

This is a biography Life of which can be read Omar Al-Khayyam through in an hour, the chief interest of which lies in the fact that it was written by a Persian, Mr. J. K. M. Shirazi, and presents a Persian's statement of Omar's philosophy and interpretation of his position. The writer is in substantial agreement with most Western editors in declaring that agnosticism, not faith, is the keynote of Omar's work. The poet was attracted by the riddle which man's life presents in the world, and he was convinced that it is incapable of satisfactory solution. He turned to the senses for alleviation and forgetfulness. His love of nature and his vitality enabled him to bear the uncertainties of the present and the future with considerable equanimity and to get a great deal of pleasure out of life by the way. Much, however, of the exploitation of "wine, woman, and song" in which Omar indulges is, in the judgment of this biographer, dramatic or lyrical, and does not represent the habits and practice of the poet. The biography is interestingly written, and is at variance in some minor points of Western interpretation of the conditions under which Omar wrote. It cannot be regarded as a contribution of permanent value to the literature on this subject, but it is profitable reading. The volume is bound in the Persian style, with elaborately decorated covers. (A. C. McClurg & Co.,

The political and economic prob-Modern lems of Germany, her general Germany policy, her amb tions, and the causes of her success, form an increasingly interesting and absorbing topic of discussion. To the general fund of information regarding it few books have appeared of more practical worth than Mr. Eltzbacher's " Modern Germany." First of all we are instructed as to the functions of the State, a striking contrast being drawn between the exercise of those functions in England and in Germany. As to German expansion, special attention is given to the peculiar problems presented in its connection by Austria-Hungary, by Russia, and by Anglo-Saxon countries. In this expansion the German Emperor is a particularly picturesque and influential factor: Mr. Eltzbacher does well to devote a chapter to him. We are then informed as to the German army, the rise and power of the Socialists, the condition of rural industries and of methods of transportation. Finally, we are instructed as to the general German fiscal policy. In view of the new tariff which is going into effect on the first of

Chicago. \$1.50, net.)

March, Mr. Eltzbacher's book will receive a timely welcome. From it we learn why the new tariff has been received with favor, for the beneficial effect of previous protective tariffs was immediate and has been lasting. Though non-industrialists have predicted the ruin of German industries in consequence of the forthcoming increase of protective duties, the manufacturers are supporting protection because by it, they say, they have increased their production and have afforded fuller employment and rising wages to the working classes. Such an improvement was welcome, as a considerably increased population had to be provided for, the inhabitants having increased from 45,000,000 in 1880 to 56,000,000 in 1900. Mr. Eltzbacher writes as a protectionist, and his argument is of extreme interest; to the general student, however, his book might have been more valuable if he had devoted more space to the arguments of his opponents. We note his fairness, nevertheless, in admitting that the German chemical industries (to which he deservedly devotes a chapter) have achieved their commanding success practically without any fiscal aid. This is specially notable, since all other German industries have been fostered by perhaps the most scientific and the most skillfully framed of existing protective tariffs. (E. P. Dutton & Co., New York. \$2.50, net.)

This story by Dimitri Me-Peter rejkowski is by no means inand Alexis tended for the entertainment of the average novel reader, or indeed for entertainment at all. It has its value, nevertheless, as a wonderfully vivid picture of Russia in the beginning of its formative life as a civilized nation. It includes the tragic and revolting story of Peter the Great's distrust of his son Alexis, and of the imprisonment and torture and final execution of Alexis—as some say, and as is here stated, by the very hands of the father himself. All this was an outgrowth of the almost incredible barbarism of Peter's time, against which he himself, although at times more than half barbarian in his instincts and actions, was struggling in his purpose to make of Russia a nation governed by European ideas. There is very much in the book that is repugnant to one's taste and sensibilities. Its coarseness and certain disgusting details can be excused, if at all, only on the ground that they form a necessary part of a true description of the time and people dealt with. Cruelty, torture, beastly excesses of all kinds, were the result of faults, not only in the personal life and character both of Peter and Alexis, but in those of the people at large; and the strange thing psychically and psychologically is the presence (again equally

Digitized by Google

The unnamed author of

in monarch, heir, and people at large), together with these horrible faults, of an exalted purpose. In Peter this took the form of striving for the upraising of Russia; with Alexis and vast numbers of the people it took various forms of singular religious exaltation. This exaltation was responsible for the hatred of Peter as Antichrist and for the existence of large sects possessed of such insane religious frenzy that they burned themselves to death by the hundreds, committed self-mutilation, and indulged in other extraordinary and wild conduct, all in the name of religion. This book is the third of a so-called Trilogy, connected by an underlying idea in the author's mind, but altogether too subtly for most readers, the whole being entitled "Christ and Antichrist." The first book, "The Death of the Gods," was a story of Julian the Apostate. The second was "The Romance of Leonardo da Vinci." The power of Merejkowski cannot be gainsaid, but of these three books the first only has the merit of constructive ability, and the present book is least of all a novel in the ordinary sense. It is tumultuous, turgid, and sometimes prolix, while the rhapsodical final chapter is all but unintelligible. The author's preface shows that he has had in mind throughout a sinister and melancholy parallel between the unfortunate and irresolute Alexis and the present Czar of Russia. (G. P. Putnam's Sons, New York. \$1.50.)

The Plays and Poems of Christopher Marlowe pher Marlowe" is in very taking form, with flexible leather binding, printed on very thin but opaque paper, and presenting in convenient form for pocket carriage the work of Shakespeare's greatest contemporary in dramatic writing. (Charles Scribner's Sons, New York. \$1.25, net.)

This is an acceptable The Poetical Works one-volume edition of of Lord Byron Byron's poems, edited by Ernest Hartley Coleridge, who contributes an introductory memoir of some length in which Byron's personal history and his career as an author are described in a more readable way than is common with introductions of this kind. Mr. Coleridge's final judgment is that "it is only in England and amongst his own people that Byron stands in need of an apology. . . . Poetry will not be admired or read at the bidding of others, but there is food for reflection in the proof of a world-wide fame." The title-page of this edition makes the claim that this is the only complete and copyright text to be found in one volume. (Charles Scribner's Sons, New York. \$1.50.)

The Prairie and the Sea This is the title of a series of pleasing out-of-door talks and rambles. The author, Mr. William A. Quayle, is always sympathetic in his moods, is an ardent worshiper at the shrine of nature, and is at times playful, at other times ecstatic. The book is made beautiful by a very large number of altogether charming photographs and marginal drawings. (Eaton & Mains, New York. \$2, net.)

The Religion of this brief but weighty ut-Christ terance has rightly judged that what he says is of more consequence than who he is. He is, however, immediately recognizable as a cultured writer and a thinker of uncommon force. His theme is the radical question of our time, "What is Christianity?" and his text is Lessing's remark," The Christian Religion has been tried for eighteen centuries; the Religion of Christ remains to be tried." By the Christian religion is meant a body of religious doctrine supported by an ecclesiastical organization. The religion of Christ is the attitude of the spirit toward God and man that Jesus manifested as controlling his life. The world outgrows the former; it needs and hungers for the latter. Dogmatism and ecclesiasticism are losing power; the religion of authority wanes; the religion of the spirit is a rising tide. In his survey of the present situation the author notes that Roman Catholicism "has become more than ever a religion of authority, while Protestantism is fast transforming itself into a religion of the spirit." Two branches of the Protestant body seem to him in a problematical position. The Unitarian, with its principle of salvation through character, appears well conditioned for spiritual leadership, but in danger of stagnating in a dry intellectualism. The Anglican, hitherto advantaged by the Janus-faced combination of its Protestant Articles and its Catholic liturgy, must soon decide whether to part with its Protestantism or with its dogmatic ecclesiasticism. The rending of the veil which the Christian religion has drawn over the religion of Christ discloses the secret of the lost unity of the Church, as a unity based on the real needs and facts of life, on the things to be done in order to real salvation now, in the conflict with evil. Not that Christianity is simply an ethical system; rather it is this vitalized by a religious consciousness, certain that God is with us. Just this, "the inward salvation of the religious consciousness of Jesus—the religion of Christ," not "the outward salvation of the Christian religion," is the gift of God to the seeking soul. These

thoughts have been uttered before, but never more clearly or attractively, and they well express the spirit in which the movement for the improvement of theology should proceed. (G. P. Putnam's Sons, New York. \$1.50.)

The first sentence of Rightly Instructed this book by Dr. in God's Holy Word Beckwith, Bishop of the Protestant Episcopal Church in Alabama, and also the preface by Dr. Du Bose, of the Sewanee Theological Seminary, strike the right note-" Christianity is a life." Accordingly, the Bishop proceeds to set forth the teaching of the Church concerning "the personal life of her members," as laid down in her Catechism. But under this Biblical conception of Christianity as a life the ecclesiastical pretension that Christianity is a system of dogma is found to be smuggled in, and this to an extent that only high-churchmen can approve. It appears that to be "rightly instructed in God's Holy Word" is to deny the name of "Church" to all "bodies of Christian people" unconfirmed by bishops, and the name of "children of God " to all persons not baptized. (Thomas Whittaker, New York. \$1, net.)

This account by Dr. W. G. Aston, an accomplished nippologist (if one may coin a word in imitation of the recently approved term sinologist), of the religion of Old Japan, "The Way of the Gods," still the official though languishing cult of New Japan, is of no small interest to the general reader, while primarily intended for students of the history and science of religion. Here at least a "decidedly rudimentary" religion contradicts the ancient Roman theory, revived by some modern scientists, that the gods originated in human fears. "Shinto," says Dr. Aston, "is essentially a religion of gratitude and love." Fear, indeed, of the natural powers that sustain human life is not wanting, but they are regarded as on the whole beneficent, and worshiped primarily with gratitude. (Longmans, Green & Co., New York. \$2, net.)

Silas Marner
An artistically made edition of a story which a great many readers of George Eliot regard as her masterpiece, the special feature being the twenty-four colored illustrations by C. E. Brock, which are very taking but not entirely characteristic of the story. (E. P. Dutton & Co., New York. \$2.)

The Story of Cambridge

Dean Stubbs knows his Cambridge at first hand, and, what is as important, knows also from his charming seclusion the Close at Ely Cathedral he is within easy reach of the old university town, and

his excursions have borne fruit in a series of pleasantly written chapters which tell the story of the town chiefly in connection with the University from the earliest times to the present. The volume follows the general method which has made the series so attractive and useful, and is enriched with a number of illustrations by Herbert Railton of a quality and interest which only an English university town could furnish. (J. M. Dent & Co., London, England.)

The Tragedy of King Lear

The latest addition to the First Folio edition of Shakespeare by Miss Charlotte Porter and Miss Helen A. Clarke further works out a scheme which makes this edition quite invaluable to students of Shakespeare. The text of the First Folio is reproduced, with a copious supply of notes, literary illustrations, a glossary, a list of variorum readings, and a careful selection of the most important criticisms of the play. (Thomas Y. Crowell & Co., New York. \$1.)

William T. Sherman in the excellent series of "American Crisis Biographies," is from the pen of Mr. Edward Robins. It can scarcely be called a biography of General Sherman, for little attempt is made to treat the years of his youth and late manhood, attention being centered almost exclusively on his career in the Civil War. But it presents a truthful and striking portrait, and is very acceptable as a military memoir. An admirer of the General, Mr. Robins is in no sense an apologist for him, exposing his defects as clearly as the qualities which made him one of the leading figures of the war. It is pleasing, too, to find that in writing of the battles and campaigns a scrupulously fair attitude is preserved. We cannot, however, always agree with the author's estimates of the commanders with and against whom Sherman fought; and it is to be wished that in his presentation he had attained a higher level of literary quality. But his book is always interesting and readable, and we gladly commend it. (George W. Jacobs & Co., Philadelphia. \$1.25, net.)

Who's Who: 1906

This is the new annual edition of the English reference-book having the title "Who's Who," and one could wish that the American biographical dictionary having the same name was also an annual instead of a biennial publication. The two have proved almost indispensable in newspaper offices, and are of constant value to many other workers. Their success has been due very largely to the care with which they have been edited and to their abstinence from any kind of social

Digitized by Google

laudation or exploitation. Both of the works confine their biographical articles to the condensed statement of facts regarding the subjects. The present issue of the English book comes down in its data to September, It is bulkier than previous issues. although some of the tables which have formerly been prefixed to the book itself have now been published, with other useful information, in a separate Year-Book. This is the fifty-eighth year of the issue of this book, and it has become universally recognized as the only satisfactory compendium of the kind now in existence. It does not, of course, fulfill all the functions of a biographical dictionary, nor does it pretend to, but within its chosen field it is comprehensive and almost invariably accurate. It would be easy to point out a certain lack of proportion and uncertainty of choice as to the foreign, and particularly the American, names included in this

book; but as the inclusion of any such names is really outside the main purpose and field of the book, such a criticism would hardly be fair. (The Macmillan Company, New York.

The Writings of

A simple, tasteful volume containing Saint Francis of Assisi the work of Saint Francis, including a group of six letters translated by Father Paschal Robinson, of the Order of Friars Minor. The translator supplies an introduction which gives some account of the writings, makes some comment on their quality, and gives a brief history of the manuscripts and the various editions. A series of notes, an appendix relating to doubtful, lost, and spurious writings, and a bibliography, with an index, give the volume, which is tastefully made, a completeness which many books of this kind lack. (The Dolphin Press, Philadelphia. \$1, net.)

Letters to The Outlook

AN ALLEGED EXCISE PARADOX

In the January Magazine Number you review the decision of the Supreme Court on the right of the Government to levy an internal revenue tax on the liquor business carried on by South Carolina. We approve of your position on that decision. Let us make you acquainted, if you are not already, with a case in which the Internal Revenue Department of the Federal Government comes in contact with the laws of a State. Jackson County, Kentucky, is "dry;" this is true also of many other counties in the State. No liquors can be sold legally. Now, the Internal Revenue Department will, on the payment of the necessary sum, license a still or a place to sell liquor in violation of the local option laws. Of course the local authorities can proceed against the still or saloon. The license granted by the internal revenue officials does not protect the one holding it from arrest and prosecution by the local authorities, but the United States marshals may not touch him.

It is our contention that in this case the Government has no moral right, if it has at present a Constitutional right, to inflict the curse upon that community which has voted it out by a well-nigh unanimous vote, or to compel it to fight the Government to keep it out. Any county or town or district is not violating the inter-State laws, nor in any way seeking to evade its obligations to the Government, nor infringing upon any of its laws. Why, then, should the Federal Government make the State law of non-effect. or give those sections which do not want liquor sold within it unnecessary trouble in keeping it out?

This procedure of the Government makes it doubly, trebly hard for the dry territory to enforce its laws-the laws of the State covering the question under discussion.

If the Government grants the State the right, or does not deny it the right, to make local option laws, why does it exercise the right to make those laws of none effect, practically, or why does it seriously interfere in their enforcement when any section of the State takes advantage of them?

ISAAC MESSLER.

McKee, Jackson County, Kentucky.

[Our correspondent, we think, answers his own question. He asks why the Federal Government makes local option laws "of non-effect, practically," or interferes seriously "in their enforcement;" but he already has said that the Federal license does not protect its holder from arrest by local authorities; it simply frees the holder from responsibility to Federal marshals. What our correspondent really urges is that Federal marshals shall be required to enforce local laws; in other words, that any locality should be able to direct, as regards the sale of liquor, the administrative policy of the United States Government. He also asserts that the granting of Federal licenses makes the task of a no-license community much harder. That is a matter on which there is difference of opinion. In some States the possession of a Federal license is accepted as *prima facie* evidence that the holder has sold liquor. In this case Federal licensing makes the task of procuring evidence in fact much easier than it otherwise would be.—The Editors.]

WORLD LEGISLATION

Walter J. Shepard's recent communication from Heidelberg in The Outlook, with its criticism of the Hague Tribunal as a substitute for war, requires the supplement of some facts. He wrote: "If war is ever to be abolished, it must be by the substitution of an international legislature rather than an international court," and he adds further emphatic statements to support such a position, saying also that "an international legislature is, for the indefinite future, quite impracticable." His points may be conceded to be well taken, in view of the relation of court to legislature. But, since he writes from Germany, he probably is not aware of what has been done already for the specific purpose of promoting a world legislature. A resolution was adopted in the Massachusetts Legislature in 1903 unanimously in favor of "a regular international congress." The idea has the indorsement, in formal document, of the entire judiciary of the State of Pennsylvania. It was approved unanimously by the Interparliamentary Union at its meeting in St. Louis in September, 1904; it was incorporated in the resolution which was presented to President Roosevelt by that Union asking him to call a second meeting of the Hague Conference; it was one of the three subjects named by Secretary Hay when he sent out the invitation to the nations in October, 1904, at the direction of the President, who promised that he would act favorably upon the petition of the Interparliamentary Union, and did so-the two remaining subjects being the matters left over from the first Hague Conference, and a general arbitration treaty. It has such strong American indorsement and such official standing that it is reasonable to expect that it will be one of the subjects brought before the second Hague Conference. That Conference has been called by the Czar of Russia, President Roosevelt waiving his invitation at the request of the Czar, so that the sovereign who called the first Conference might have the honor of calling the second. The United States has accepted the call. Therefore the project of discussion at least of the proposition of an international legislative body is bright.

Now, still further, regarding the nature of that body, as those who have taken interest in it expect to see it develop. It is not believed by them that a world legislative body will spring into being, but that it will come as the result of an evolutionary process, as other stable political developments have occurred. It is to be emphasized as a matter of indisputable fact, since world legislation is the expression of the will of the world, that such expressions have occurred already so many times that the fact of world legislation must be admitted, though the result has not been reached by a formal legislative body. Best of all illustrations is the "Universal Postal Union," for every nation on earth with a government capable of making the arrangement is a party to it. The will of the world has been expressed by the establishment of certain business arrangements. Most recent of the illustrations (of which there are over thirty of varying degrees of fullness) is the establishment of the Hague Court of Arbitration. The act of establishment was world legislation, as far as the nations which entered into the arrangement represented the world.

In due process of time, the second Hague Conference, which has been called and will be attended by more nations, through their representatives, than the first, and perhaps by more than have attended any other international gathering in the world, will meet. Whatever it does regarding practices of war or other regulations, which is adopted by the nations, will be world legislation as far as the adopting nations represent the world. Practically, the Hague Conference is already a world legislative body, with the limitation that its propositions have no binding force upon any government until they have been ratified by that government. But it is impossible to doubt that in this body we have the world legislature in active process of evolution.

When the second, or third, or nth Hague Conference shall have formulated a code of international law, and that code shall have been adopted by the nations severally, there will be a code of a quality really different and higher than present international law, and entitled to the true and distinctive name of world law. With such a code to interpret, there would be demand for the world court. Without disputing the smallest part of Mr. Shepard's assertions, it may be strongly maintained that the case for the unification of the world as a single political body is proceeding with a rapidity which is surprising in view of the shortness of the time during which the object has been a specific aim. But it is now evident, looking back upon events, that the process was well under way before the true nature of the development came to find its present acceptance. Very likely the time may be as long as Mr.

Shepard thinks before the consummation is reached, but the thing itself is already here in a manifest measure.

R. L. BRIDGMAN.

TEACHING IN THE PHILIPPINES

My recent employment in the Philippine schools enables me to comment upon the status and work of the supervising teacher, which subject is discussed by a correspondent in your issue of January 20.

It must be conceded that the difficulties encountered by the supervising teacher are numerous and sometimes discouraging, but lack of necessary instructions and requisite authority should not be among their number. As the Bureau is organized, it devolves upon the division superintendent, in charge of the work in one or two provinces, to assign the supervising teacher to his district, and from time to time to instruct him in his duties. Of necessity, these instructions are general rather than specific; much must be left to the good judgment of the teacher, as in country schools in the United States; but even to a greater extent in the Philippines than here, because of the greater differences in local conditions.

It is true that communities differ in the support given to schools, but in nearly all divisions there has been a rapid and unexpected increase in attendance. In most of the districts with which I was familiar the demand for new and larger schools was so great as to make it difficult to supply teachers and materials fast enough. The regular attendance of small children, after the novelty of school life has worn off, must often be secured by the use of the municipal police acting as truant officers; but after the school habit is once formed, the attendance becomes regular, as is shown by the reports of the intermediate and provincial schools. How to secure the co-operation of a lax presidente, and, through him, of the police, in keeping the beginners in school, is indeed a perplexing problem. When other means failed, I found a tactful word or two spoken to the Filipino provincial governor to be effective.

The difficulty of obtaining school supplies which is sometimes experienced is due in part to the unprecedented demands due to the growth of the schools, in part to the difficulty of transportation over roads all but impassable, and at times to the fact that teachers fail to send in their requisitions in time.

The ignorance and lack of training of many of the native teachers is one of the inherent difficulties of the situation, but a temporary one that is being rapidly overcome by the native teachers themselves, with the sympathetic aid and instruction of the supervising teachers in the daily or weekly teachers' classes and in the yearly normal institutes. That many towns are too poor to pay promptly the small wages of the native teachers is, alas! true. These, also, have their difficulties.

Since in the Philippines American teachers' salaries continue during all regular vacations and they receive fifty-two weeks' pay for forty weeks' work, it does not seem unreasonable that time lost by sickness during term time should be charged against the annual summer vacation; and it would seem to be a very liberal provision that teachers who have lost time in this manner are given an opportunity to make it up, and thereby suffer no deduction whatever from salaries.

Whether it be that most American teachers are able to save more from their salaries in the Philippines than in this country, or that life and travel in the Orient are attractive, or that the needs of the little brown children are so great, or whether these reasons in combination are effective, it is true that most of my fellow-teachers believed that the compensations of school work in the islands were more than enough to offset the many difficulties, the long hours, and the restraints of the Civil Service regulations affecting promotion.

W. B. Freer.

Akron, Ohio.

[Mr. Freer was supervising teacher and division superintendent in the Philippine schools from August, 1901, to the last part of 1904. His last station (as division superintendent) was at Nueva Caceres, Ambos Camarines.—The Editors.

RAILROAD FIRES

Property-owners of Massachusetts have for years been suffering heavy losses through fires set by locomotive-engines. Beautiful pieces of woodland have been destroyed, and large tracts of land have been rendered practically valueless. The railroad companies are liable to the extent of the damage so inflicted, but, for reasons that are too well known to require repetition here, the laws governing the situation have practically become a dead letter. To secure relief, once for all, from what has developed into an intolerable invasion of property rights, a movement is on foot for the introduction of certain preventive bills this winter in the Massachusetts Legislature. Such of your readers as are interested in the matter will be furnished with further details upon application to the writer.

IN all baking and cooking receipts calling for baking powder use "Royal." Better and finer food will be the result, and you will safeguard it against alum.

In receipts calling for one teaspoonful of soda and two of cream of tartar, use two spoonfuls of Royal and leave the cream of tartar and soda out, You get the better food and save much trouble and guess work.

Look out for alum baking powders. Do not permit them to come into your house under any consideration. They add an injurious substance to your food, destroying in part its digestibility. All doctors will tell you this, and it is unquestionable. The use of alum in whiskey is absolutely prohibited; why not equally protect the food of our women and children?

Alum baking powders may be known by their price. Baking powders at a cent an ounce or ten or twenty-five cents a pound are made from alum. Avoid them. Use no baking powder unless the label shows it is made from cream of tartar.

CHINA IN TRANSITION

The Anti-Foreign Rioting in Shanghai

By GEORGE KENNAN

The first of a series of articles dealing with new conditions in China and the problems growing out of the Treaty of Portsmouth. In the preparation of these articles Mr. Kennan has spent several months in travel and study in China

grand opera artists now appearing in this country and abroad. Hitherto, Mr. Edison has refused to permit Edison Records to be made by Grand Opera singers, preferring to wait until he could so improve his methods of recording, that the voices of great artists could be reproduced with all their characteristic sweetness, power and purity of tone. These improvements having been effected; the artists co-operated with enthusiasm, with the result that the first ten Edison Grand Opera Records, made by our Gold Mould Process, are a distinct advance over anything of the kind heretofore attempted.

Edison Grand Opera Records - On Sale at All Dealers

- By ANDREAS DIPPEL, Tenor
 B. 2—"ACH, SO FROMM," "Martha" . Flotow
 Sung in German. Orchestra accompaniment
- By GUSTAVE BERL RESKY, Baritone
 B. 8—"DI PROVENZA IL MAR,"

 "La Traviata"

 Sung in Italian. Orchestra accompaniment
 - By FLORENCIO CONSTANTINO, Tenor 3. 4—"LA DONNA E MOBILE," "Rigoletto" Verdi Sung in Italian. Orchestra accompaniment
- By ANTONIO SCOTTI, Baritone
 B. 5—"VI RAVVISO, O LUOGHI AMENI,"
 "La Sonnambula". . . . Bellini
 Sung in Italian. Orchestra accompaniment

- By SCARPHY RESKY, Soprano
 B. 6—ARIA, "SUICIDIO,"
 "La Gioconda" Ponchiell
 Sung in Italian. Orchestra accompaniment
- By ROMEO BERTI, Tenor
 B. 7—ARIOSO, "Pagliacci" ... Leoncavalla
 Sung in Italian. Orchestra accompaniment
- By SIGNOR and SIGNORA RESKY
 B. 8-DUET, "La Favorita" . . . Donizetti
 Sung in Italian. Orchestra accompaniment
- By ANTON VAN ROOY, Baritone
 B. 10—"CHANSON DU TOREADOR,"
 "Carmen" Bisel
 Sung in French. Orchestra accompaniment

Signor Scotti says: "I have great pleasure in informing you that the cylinders which I sang for you are excellent from every point of view, and I consider them as an absolutely natural production of my voice. I must, however, tell you that the cylinder on which I sang the air from the 'Sonnambula' pleases me most, and I certainly think it is the best of all I have ever heard."

In accordance with Mr. Edison's desire to make his Phonograph the musical instrument of the people, the price of these Grand Opera Records has been fixed at only 75c. each. Hear them at nearest dealer's. Write our Orange, N. J., office for handsome Grand Opera supplement.

National Phonograph Company, 60 Lakeside Avenue, Orange, N. J.

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.				

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

Washable Dress Fabrics 1906

At "The Linen Store"

Our collection of Linen, Cotton, and Silk and Cotton Fabrics includes not only the staple materials, but all the important novelties of the day, in the newest designs in vogue. We mention especially:

Solid Color French Dress Linen.

Embroidered White Linens in different weights,

Embroldered French Batiste, both white and in colors,

French Batiste Taffeta in white and solid colors,

(Sold Exclusively by us.)

This fabric is made from the very finest Egyptian yarns and promises to be much used by the leading French modistes.

English, Scotch, and French Madras,

In more than three hundred different designs and colors. ,

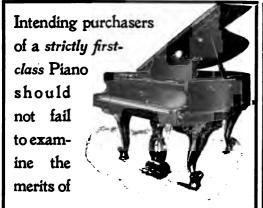

Soild Color and White Linen Etamines,

Rajah, Clifton Bond Taffeta, and Taffeta Silk Suitings,

French Voiles in a variety of small checks and plain colors.

Our mail order department for these goods is especially well equipped and we are pleased at all times to mail samples of any of the above mentioned goods on request.

JAMES McCUTCHEON & CO., 23D STREET, NEW YORK

THE WORLD RENOWNED

SOHMER

It is the special favorite of the refined and cultured musical public on account of its unsurpassed tone-quality, unequaled durability, elegance of design and finish. Catalogue mailed on application.

The Outlook

SATURDAY, FEBRUARY 17, 1906

₽.

Senator Patterson, of Col-Caucus Rule orado, has rendered a great service to the country by his challenge To his resolutions preto the caucus. sented in the United States Senate there appears to the Outlook absolutely no reply. The occasion for these resolutions was the Democratic caucus attempt to compel Democratic Senators to vote against the San Domingo treaty, whether they believed in it or not. Senator Patterson's resolution declares that for two-thirds of the Senators of any party to declare "that it shall be the duty of any Senator to vote upon any question other than as his own convictions impel him, is a plain violation of the manifest intent and spirit of the Constitution;" that its effect is "to disfranchise his State in the Senate, and to deprive it of the representation in that body the Constitution provides it shall have;" and that any Senator who permits his Senatorial action to be determined for him by such a caucus "votes not as a Senator from his own State, but as a Senator from the other States, and he augments the power of the other States beyond that permitted by the Constitution, and weakens and degrades the power of his own State in the Senate, in violation of the spirit of the Constitution." To say that Republicans have in fact, if not in form, done the same thing is no reply, because it is not true, and, if it were true, two wrongs do not make a right. To say that Senators are not compelled by such a caucus to vote against their convictions, but are only required to leave their party organization if they vote in accordance with their convictions, is to emphasize the argument against caucus rule, not to answer it. Senator Patterson has gone to the root of the whole matter. Party conferences for the purpose of mutual consultation are both right

and wise; but when the consultation has been held, the members who have attended it should be granted absolute freedom to vote according to the dictates of their own conscience and judgment, otherwise they cease to be the representatives of the constituency which elected them, and become the representatives of a body which is known neither to the Constitution nor to the laws.

9

The San Domingo
Treaty

It is quite possible that the action of the Democratic caucus

may defeat the San Domingo treaty in the Senate; but the defeat of the treaty will not necessarily end the present That arrangement, enarrangement. tered into by the President at the request of San Domingo and with the cordial approval of her European creditors, secures the payment of the just claims against her, preserves her honor, and prevents the foreign complications which would be almost certain to result if the foreign Governments were to attempt to secure their claims by taking possession of the custom-houses and collecting the money themselves. And San Domingo is getting out of the pro rata of customs receipts paid over to her by honest administrators, selected by the President, more income than she got out of all the receipts when she administered the customs herself. But it does not require a treaty to enable the President of the United States to act as an arbitrator. And if the treaty fails, it will still be possible for the President, at the request of the Domingan Government, to continue to nominate the collector of customs and to pay over to the foreign Governments the amounts prescribed by the Domingan Government as at present. The practical difficulty is that already the sum of a million

of dollars has been accumulated for the foreign creditors awaiting the action of the Senate. If the Senate rejects the treaty, this money would be legally subject to the order of the Domingan Government, and it is a little doubtful whether its politicians would possess the hardy honesty sufficient to pay it over to the creditors to whom it morally belongs.

•

The Railway Rate The Railway Rate Regulation Bill has Regulation Bill passed the House without amendment and with only seven votes against it, all of them Republican. It has now gone to the Senate, where more serious opposition may be expect-The indications are, however, that this opposition will not come from the great railways, which are inclined to assent to, if not to favor, reasonable provision for Government supervision and regulation, but from favored shippers who have been able even to coerce the railways, and from that not very intelligent conservatism which opposes anything which is new simply because it is new. It is certain, however, that important amendments will be suggested. Perhaps the two most important ones now under consideration are, first, one specifically providing that express companies shall be included, the other that some explicit provision for appeal to the courts from the decision of the Inter-State Commerce Commission shall be The first amendment appears to made. The Outlook needless. The bill explicitly provides that "the term 'transportation' shall include cars and other vehicles and all instrumentalities and facilities of shipment or carriage, irrespective of ownership or of any contract, express or implied, for the use thereof, and all services in connection with the receipt, delivery, elevation, and transfer in transit, ventilation, refrigeration or icing, storage, and handling of property transported." It would be difficult to construct phraseology more comprehensive, and the insertion anywhere in the bill of the phrase "express companies" might easily be taken by the courts to imply that other corporations engaged in transportation than express

companies were not included. Concerning the other amendment it is not so easy to reach a definite conclusion. The bill as framed contains no special provision for any appeal to the courts from a decision of the Commission fixing a rate as just and reasonable. It, however, in terms recognizes that the railways could, by injunction, delay the execution of such an order until the courts had passed upon it. How far the courts would go in such injunction proceedings in reviewing the discretion of the Commission we do not pretend to know. In general, they are very cautious about revising action whether by a legislative or an administrative body on the ground that the discretion of legislative or administrative boards has not been wisely exercised; but, unquestionably, injunction proceedings could be used, and in some instances might be used, to nullify the provision of the law that the order of the Commission shall go directly into effect. It has, therefore, been suggested in certain quarters that the bill itself provide for an appeal to the courts from the order of the Commission; that, as a condition precedent to such an appeal, the railway be required to pay into the court, week by week or month by month, in cash, the difference between the rate fixed by the Commission and the rate which it may be collecting from the shippers. The effect of this, it is believed, would be to make the railways slow to take such appeals and eager to press them to an early decision. On the other hand, any such amendment would have to be very carefully drawn, otherwise a specific provision for an appeal from the Commission to the courts might lead the courts to regard the Commission as a judicial body; and it is a well-settled fact that a judicial body cannot determine what is a just and reasonable rate to be applied in the future. It can only decide what is an unjust and unreasonable rate which must not be maintained. Journalists who are contending that an amendment providing for an appeal from the Commission to the courts is fatal to the bill. and cannot be accepted by the Administration without the abandoning of this well-known position, are not very well

informed. The earnest friends of the bill are divided in opinion respecting the advisability of such an amendment, and it is very evident that it would not be in the least inconsistent with the two fundamental principles which the Administration has urged from the first, that an administrative board shall have power to determine what is a just and reasonable rate, and that this determination shall go into effect at once without waiting for legal proceedings to be initiated and carried through either by the complainant himself or by the Commission on the petition of the complainant.

(4)

The General Pension The Nation's Bill for the current year Pension Bill passed the House of Representatives last week with little or no opposition. It appropriates a total sum of \$140,245,000. The cost of pensions to the taxpayers was brought out in a striking way by the report, which showed that while the actual cost of the Civil War was about \$6,000,000,000, it now seems probable that the expenditure for pensions will, before the last pensioner ceases to receive payment, equal that sum, thus making the total cost of the Civil War to the United States \$12,000,000,000, which would amount to three-fourths of the entire wealth of the country when the war broke out. As usual, the report contains some picturesque facts relating to our old wars, such as that there were on the pension rolls last June five names of persons receiving pensions on account of the War of the Revolution, which closed 123 years ago, and that 776 persons are still drawing pensions on account of the War of 1812, the last participant in which very recently died, while for the Mexican War there are 4.540 soldiers and 7.653 soldiers' widows receiving pensions. Arguing from the rate of longevity and marriage statistics shown by these facts and by the known facts about our Civil War pension list, Mr. Gardner, the Chairman of the Pension Committee, draws the conclusion that in 1924 there will still be 346,662 Civil War pensioners. Adding to this number the

132,414 pensioners who, under the same ratio, will in 1924 be drawing pensions on account of the war with Spain, it is estimated that twenty years from now, assuming that we have no wars in that time, the United States will have nearly, if not quite, half a million pensioners on its roll. The generosity of the American people in this direction has been unexampled, and has been aided by a carelessness which is not as commendable as the generosity; there can be no doubt that public sentiment is in favor of a liberal policy in regard to pensions, but it is no less certain that with this liberality should be joined the closest inspection of all claims and careful restrictions to make fraud or error impossible in passing upon applications. passing of 429 private pension bills by the House one day last week in seventytwo minutes does not seem on the face of it reassuring as to the care taken. One of the provisions of the new bill makes into statute law the Order No. 78 of the President, declaring age conclusive evidence of disability.

•

The testimony given before The Panama the Senate Committee on Investigation Interoceanic Canals last week by the former chief engineer, Mr. John F. Wallace, did not include any definite charges against the management of affairs at Panama. It is true that Mr. Wallace asserted in general terms that in his opinion Mr. W. N. Cromwell was allowed to exercise too large an influence in Isthmian matters, and that while chief engineer he had feared that, as "all the interests in Panama look upon Cromwell as their friend," he might have his mind perverted and "some time might give the wrong advice, and the result would be a scandal." This hypothetical feeling of distrust against Mr. Cromwell as an expert unofficial adviser was supported, so far as we can find, by only one direct statement of fact, namely, the assertion that the Panama Railroad Company through its board of directors had declared a dividend of more than \$100,000 in excess of what the road had earned, and had afterward sold bonds for money with which to repair its ships

and rolling stock. The total result of Mr. Wallace's testimony was slight in itself and was lessened by his natural bias against the Administration growing out of Secretary Taft's public rebuke of Mr. Wallace's conduct in resigning his position as chief engineer. This action Mr. Wallace now, after an interval of many months, undertakes to explain and defend on quite different grounds from those he put forward at the time. His belated excuse is that he found that he was to have less power than he had supposed, his distrust of Mr. Cromwell, and his fear that friction between himself and Mr. Shonts was inevitable. He meant to tell all this to Secretary Taft, he says, but "when I found myself confronted with both Secretary Taft and Mr. Cromwell," he continued, "I contented myself with giving as a reason for resigning the larger compensation I hoped to secure in another employment. [It does not appear that such employment has been obtained.] I did so because I assumed that that reason_would be accepted as sufficient for the time being and avoid the discussion of other reasons in the presence of Mr. Cromwell." We give this explanation, as The Outlook stated the other side of the matter rather fully; but in general a second thought is not accepted as best when it is offered as a substitute for an excuse which failed when it was offered as a first thought. So far the Senate Committee has not heard any evidence tending in the least to substantiate the reckless assertions of extravagance and mismanagement made here and there by irresponsible writers.

(A)

In their speeches at a Rapid Transit dinner of the City Club in New York of New York last week, Mr. George L. Rives, counsel for the Rapid Transit Board of the city, and Mr. Charles Stewart Smith, a member of the Board, agreed that the bill now before the State Legislature greatly restricting the powers of the Board would make it impossible to get any one to build another subway. Their warning should not be ignored. In the attempt to limit the power of corporations there is danger of too greatly hampering the freedom of the city's agents. The law ought, of course, to set some bounds to the authority of a Rapid Transit Commission; it ought, for instance, to prohibit any such commission from granting a franchise in perpetuity; no administrative board, indeed, ought to be allowed the power to extend a franchise much beyond a generation. To some degree the Legislature ought to protect the city against the possibility of being helplessly defrauded by the action of a commission which may happen for the time being to be dishonest or unwise. But any protection beyond that is really not protection, but injury. The Rapid Transit Board, for example, ought to be allowed to make a contract with one party for the construction of a subway, and with another for its operation. Mr. Rives may be right in declaring that the builder of a rapid transit road ought to be its operator, for then it will be in the builder's interest to construct the road honestly and speedily; but that is a matter, not for the Legislature, but for the administrative board to The Rapid Transit Board, in other words, ought to be allowed the option of deciding whether, under certain circumstances, separate contracts for construction and operation might not be preferable to an exorbitant contract for joint construction and operation. It is highly significant that in all this discussion of rapid transit in New York City the principle of municipal ownership seems to be taken for granted. Mr. Rives said, emphatically: "It has been settled that no more rapid transit roads are to be owned by private persons." In the face of this fact, it still seems necessary to keep repeating that municipal ownership is distinct from municipal operation. The city of New York, for example, owns its subway, but does not own its elevated roads; yet practically the same company operates both. lic opinion in New York is very much alive on this subject. The attempt of a corporation to build a tunnel beneath the East River under a franchise of doubtful validity has been smartly challenged. A bill to make the franchise valid under the guise of a general law

has been unmasked. The building of more subways is a matter of pressing necessity; but it evidently will not be, and ought not to be, undertaken inconsiderately.

Senator Raines has Women Taxpavers introduced in the New and the Suffrage York Senate an act to give the suffrage to women who are taxpayers at special tax elections in cities of the third class. It can hardly be necessary to say to our readers that the object of this bill is not to secure property rights to a class of property-owners, but to take one step toward general woman suffrage. It is an entering wedge with a specious appearance, and would hardly require mention except for the fact that, introduced by Senator Raines, it may secure some Republican support which otherwise would not be accorded There is no conceivable reason why women should be allowed to vote in cities of the third class and refused a vote elsewhere in the State. There is no reason creditable to women why a vote should be given them when they are taxpayers and given men who are not taxpayers. Woman's suffrage may be promoted, possibly, by veiled methods of this kind, but the question of woman's suffrage can properly be considered only on broad grounds, and by answering such general questions as: Is suffrage a National right or a special duty? Does property vote or do persons vote? Is the family or the individual the unit of the State? Is suffrage a privilege which the masculine class are denying to women, or is it a burden and responsibility like militia duty, from which they in the past have been exempt, and from which the vast majority desire to be exempt in the future? The readers of The Outlook need not be told what answers The Outlook makes to those questions.

A joint committee Insurance Department of the Pennsylvania Legislature has just completed an investigation of the State Department of Insurance. The subject was brought to the attention of the Legislature by Governor Pennypacker in his

call for a special session. He has been from the beginning of his term opposed to the system by which certain State officials receive their compensation in the form of fees and not as regular salaries. In the discussion of a bill to give the Commissioner of Insurance a fixed salary in place of the smaller salary and certain specified fees, as had formerly been the custom, conditions were disclosed which led to the appointment of the investigating committee. The gravest abuse which the inquiry covered was in the case of the office of Actuary. In 1873 a statute provided that the Actuary should receive a fee of three cents per one thousand dollars for each life insurance policy issued; in 1885 this fee was reduced to two cents. Mr. Robert E. Forster testified that he was appointed Actuary in 1891 and that he had performed the work of this office since that In the years from 1891 to 1894. under Commissioner Luper, he had divided the fees with the Commissioner. although they were properly a perquisite of the office of Actuary. In the next five years, under James H. Lambert, fifty per cent. of the Actuary's compensation went to the Commissioner, twenty per cent. to his son-in-law, who was employed as assistant Actuary, and thirty per cent. was retained by Mr. Forster. In 1899, upon the accession of Israel W. Durham to the office of Insurance Commissioner, he appointed as Actuary J. Clayton Erb, who has been his private secretary for many years. The statement was made by the Committee that "this appointment was made, not for any personal fitness on the part of J. Clayton Erb for the position, for he was not then and is not now such an Actuary by profession as is contemplated by the act of Assembly in this case, but for the purpose only of allowing him to receive the compensation of that position." Mr. Erb retained Mr. Forster on a salary to do the actual work of the Actuary's office. Mr. Erb's testimony showed that he received during the past ten years over \$140,000 as compensation for the work of the Actuary, and an additional sum of over \$15,000 for examination of insurance companies alleged to have been made by him. His

testimony also showed that he was entirely ignorant of the methods and principles involved in actuarial work, and that the services for which he received compensation were almost entirely performed by others. The report of the committee disclosed further that under Commissioner Durham's administration a number of officials regularly drew compensation from the department without rendering any tangible service, that there was no supervision of the Commissioner's accounts and no check on his power to draw on the State Treasurer for the expenses of his office. The committee recommended that the Insurance Commissioner and all other officers and employees in the service of the State should be on a salaried basis, and that instead of examiners of insurance companies being selected promiscuously and paid by the companies examined, as many examiners as may be necessary should be salaried officials of the State, and the cost should be upon a fixed rate proportionate to the work done, and this cost paid into the State Treasury for the use of the State. The committee recommended to the attention of the Governor and the Attorney-General the testimony which may tend to establish malfeasance of former Commissioners Luper, Lambert, and Durham, and their subordinates, so far as it relates to receiving a part of the Actuary's compensation during their respective administrations, and also the testimony that during Durham's administration the State was defrauded by vouchers being granted and payment made for services which had never been rendered or for which there was no legal liability.

(G)

Roman Catholic Church Property in France Despite the good example set by the head of the Roman Catholic Churchin France, Car-

dinal Richard, Archbishop of Paris, there have been many disturbances during the last fortnight in Paris and the provinces between the Roman Catholics and the Government authorities. By the new law which went into effect last December, Roman Catholic Church property acquired since 1801 remains in possession

of that Church; property acquired before 1801 reverts to the State. This, however, the State may lease or sell to local religious associations, which, like secular associations, must be formed under Government regulations and submit to Government supervision. In this process the Government's initial step is to find out by an inventory just what property, real and personal, is affected. Such an inventory is to be made in company and in negotiation with the legal representatives of the local religious establishments or churches in question. Accordingly, acting on instructions from the Archbishop of Paris, when the Government representatives appeared at the Cathedral of Notre-Dame, an arch-priest met them at the door and courteously conducted them throughout the great church, facilitating their work at every step, and thereby adding immensely to the dignity of both Church and State. This action discouraged a different procedure in many of the other Roman Catholic churches in which inventories were made, the authorities of which had expected a bolder example from Cardinal Richard and his clergy. But at the Madeleine, the most prominent church in Paris after the Cathedral, Abbé Chesnelong read a protest; there was a similar protest at the well-known Church of St. Roch, accompanied by considerable violence; while at the Church of St. Pierre-du-Gros-Caillou the violence was so great that about fifty persons were injured and as many arrested. When the Government agents arrived at St. Pierre its bells were mournfully tolled. and the people inside, about three thousand in number, who had locked and barred the church, began singing psalms, while outside a rough element shouted revolutionary songs. The Prefect of Police arrived and thrice vainly summoned the congregation to open the Firemen were then ordered to force an entrance, using their hatchets. When they attempted to break the windows, revolver shots rang out. The firemen retired, but quickly scrambled up on the roof with a hose, and flooded the interior of the church. Meanwhile the doors had been battered down, but from improvised barricades within the defenders used red pepper with which they

blinded a number of the police and firemen before the Government authorities gained entrance. Similar scenes occurred at the Church of Ste. Clotilde. The resistance here as elsewhere was mostly the work of the ignorant, who, even despite remonstrances from some more liberally inclined priests, were firmly determined to oppose a supposed spoliation of the churches, which contain millions of dollars' worth of ecclesiastical treasures and thank-offerings from the faithful. The people were specially inflamed, however, by the rumor that the Government authorities were about to commit sacrilegious actions at the altar in connection with the ciboria, or tabernacles, where is kept the host-which Roman Catholics believe to be miraculously transformed into the body of our French events are peculiarly picturesque; of the twenty-two hundred church inventories already made, however, very many gratifyingly lack what the French call "incident."

₩

Mr. Chamberlain and Mr. Balfour

Last week, in a letter to the Chairman of the British

Tariff Reform League, Mr. Chamberlain issued a declaration to the Conservative-Unionist party. He reiterated his determination not to be a candidate for the party leadership, first, because, after working in friendship with ex-Premier Balfour for twenty years, he does not intend to place himself in competition with that leader; and, second, because he holds that the leader of an amalgamated party seven-tenths of whose members are Conservatives ought himself to be a Conservative. The situation, as Mr. Chamberlain justly says, is not a question of leaders, but solely of what the future policy of the party will be. Mr. Chamberlain then states his attitude with respect to the party organization in case Mr. Balfour should continue as leader without adopting Mr. Chamberlain's distinguishing tenet, the desirability of a general import duty, in favor of which the ex-Premier has never yet Whatever protectionism Mr. spoken. Balfour may include under his general political belief may be found in his plea

for the power to retaliate, in case England is treated unfairly as to tariff duties by some foreign country. While the great majority of tariff reformers in the House of Commons are ready to accept Mr. Balfour's general leadership, says Mr. Chamberlain, that majority would welcome a declaration by the ex-Premier showing that tariff reform is not to be abandoned by the party, and, if possible, indicating a definite and unmistakable programme for the future which all tariff reformers could support. If, however, most Conservative-Unionists should favor abandoning tariff reform, or should turn out to be Unionist "Free Fooders" (being practically at one with the Liberal Government in offering unconditional opposition to any and every change in fiscal policy), then the tariff reformers would have to reconsider their position. But, declares Mr. Chamberlain,

After giving the matter full consideration, it does not appear to me that it will be necessary or wise for tariff reformers to separate themselves from the party as a whole or from its general leadership.

₩

Mr. Chamberlain's Views and Motives

If Mr. Balfour retains that "general leadership," however, he

must be prepared to take charge, not only of one, but of two distinct groups. Mr. Chamberlain announces that tariff reformers may now properly constitute themselves a separate Parliamentary group, acting independently on tariff questions, taking care that their views are fully represented at by-elections, and watching for opportunities to advance the cause to which they are attached. Mr. Chamberlain believes that many such opportunities will arise. He does not mention what they are, but his opponents will understand them to be the chances to intrigue and bargain with the Irish and Laborite groups to overthrow the Liberals. Indeed, Mr. Chamberlain has begun an open flirtation with the Laborites, and has made the somewhat disquieting statement that the Irish are of necessity protectionists. Finally, in his manifesto, after strongly urging the reformation of the party machinery, Mr. Chamberlain insists that there shall be a convention of the party (doubtless

expecting that the tariff reformers would preponderate there), and thus warns weak-kneed brethren who might feel inclined to put aside protection because of the overwhelming verdict against it at the polls during these recent weeks:

Tariff reformers sincerely believe in their principles, and cannot be expected to put them aside to suit the exigencies of party wire-pullers. . . . They [tariff reformers] are ready to work with their Unionist colleagues for a common object, but they cannot accept a policy of inaction and mystification with regard to the main object of their political life.

Of course Mr. Chamberlain is clever enough to see that the Opposition is not yet ready for his own official leadership, despite such daily protests in the English press as the following:

The real leader, the real inspirer of a party should be the nominal leader also. Why, in the name of common sense, should Mr. Balfour be called the leader of a party whose policy was neither initiated, nor inspired, nor effectually promoted by himself? At this moment we surely want a fighting man to lead us, a man alive with passionate purpose and with the fire of strong belief. We have that man in Mr. Chamberlain.

But Mr. Chamberlain still wishes to assure to his part of the Opposition whatever benefits may still accrue from the leadership of one who perhaps did not "initiate" certain policies, but who did "inspire and effectually promote" them, despite the profound differences in temperament and methods which distinguish him from the average Englishman. If Mr. Chamberlain still offers a lengthened lease of political life to Mr. Balfour, however, it is with a threat—the indication that protectionists will now constitute an independent group. He thus accentuates rather than lessens the party tension, especially when it is considered that the manifesto may be regarded as an attempt to capture the party machinery. He would have Mr. Balfour understand, we think, that the choice lies between Chamberlainism and political annihilation.

The Canadian
Tariff Commission
Tariff Commission

The Canadian Tariff
Commission has now completed its stupendous task of traveling all over the Dominion to ascertain local opinion with

regard to the new tariff. It began work on the 3d of September, 1905, and was continuously on the go from that time until the beginning of February, when it concluded its work in the Maritime Provinces by a two days' session at Halifax. It has traveled over fifteen thousand miles, held sessions in fiftyodd towns and cities, and for the most part of the time the three Commissioners-Mr. W. S. Fielding, Minister of Finance, Mr. W. Paterson, Minister of Customs, and Mr. L. P. Brodeur-and Mr. John Bain, Deputy Minister of Customs and Secretary to the Commission, have lived in a railroad car. The outstanding features of the work of the Commission in eastern Canada, as shown by reports from a special correspondent of The Outlook who accompanied the Commission on its travels, are easily summarized. The trade relations of eastern Canada with the United States are closer in the Maritime Provinces than they are in Ontario-much closer than the ordinary reader of American and Canadian newspapers would imagine; and in Quebec and New Brunswick there was much soreness over the Dingley Act of 1897, and the mode in which the Act is administered by United States custom-house officers and appraisers. Quebec farmers complained much of the high duties in the American tariff aimed at the exclusion of Canadian hay, but they did not urge retaliation. On the contrary, the farmers who appeared at St. Hyacinthe insisted that retaliation could only have the effect of making conditions worse for them; for if Canada adopted retaliatory tactics they were sure that the United States would retaliate also, and with any further increases in the duties on agricultural products the farmers of Quebec would be completely deprived of the small market they now enjoy in the United States. The most insistent and vehement demands for retaliatory measures were put forward at Newcastle, Fredericton, and St. John, New Brunswick. At Newcastle there were serious complaints of the high-handed action of the American custom-house officials in revaluing consignments of fish, and of the impossibility of ever securing any repayment of duties from Washington

when proof was forthcoming that these revaluations worked injustice to Canadian exporters. Dingley rates, and plenty of them, were pressed on the Commission at St. John—more strongly than at any other place visited by the Commission except Montreal and Toronto, when members of the Canadian Manufacturers' Association put in their pleas for duties on American manufactures as high as those imposed in the American tariff on Canadian manufactures. But at St. John, as at Montreal and Toronto. the Commissioners would give no countenance either to Dingley rates or to retaliation.

(6)

Quebec and New Bruns-Two Proposals wick developed two proposals of serious import to the United One of these proposals was States. that the Dominion Government should impose prohibitive export duties on pulpwood, and thus prevent scores of mills in the United States making news printing paper from obtaining their supplies of raw material. The paper manufacturers at Three Rivers put in this plea, as they desire to offset the competition of American mills for the news printing paper business in England and Australia. Ontario now imposes conditions in Crown leases of timber-limits which prevent pulp-wood from being shipped to the United States; but only legislation by the Dominion Parliament can set up export duties applicable to all the Provinces, and to all the wood-pulp lands whether leased from the Crown or held as freehold by the owners. The second proposition was made at the city of Quebec and vigorously supported at St. John and Halifax. It was that the British Preference—that is, the reduction in duties—shall be denied to all imports from Great Britain which are not landed at Canadian ports. Imports to the value of nearly twenty-five millions of dollars now reach Canada via Portland, Boston, New York, and Philadelphia, and a change in the law such as the Maritime Province ports are demanding would mean the loss of this transport business to American ports and American rail-The Commissioners were extremely noncommittal when this propo-

sition was submitted, but the nature of the movement behind the proposal makes it certain that before the new tariff finally takes shape much pressure will be exercised to divert this large volume of transport business to Canadian ports and Canadian railways. The only opposition comes from Toronto, London, and Winnipeg; but there is some apprehension that if this business were diverted from American ports and American railways by Parliamentary enactment there might be trouble with the United States over the bonding privilege, which is of much value to both American and Canadian railways. At Ouebec and at Fredericton, as at the sessions in Toronto in November, there was a strong and persistent movement against the circulation of American magazines in Canada. It is estimated that the annual circulation of these magazines reaches five millions; and their exclusion is asked because they carry so much advertising, and directly and indirectly increase the sale of American goods in Canada. The shoe manufacturers of Three Rivers, Quebec, and Fredericton made the strongest push for the exclusion of these American advertisements: and the same interests also strongly complained of the monopoly conditions which the American Shoe Machinery Trust, as they describe it, imposes in its leases for machinery used in Canadian shoe factories. St. John, as at Montreal in October, there were vehement complaints of the tyranny of the American Steel Trust. One allegation made at St. John was that the trust had threatened to close all the wire nail factories in Canada unless the Canadians engaged in this industry would agree to buy all their wire rods from the trust at prices much in advance of those at which wire rods can be imported from England or Germany. The British Preference established in 1897 was warmly commended by the French-Canadian farmers and by representatives of the farmers of Prince Edward Island when the Commission was at Charlottetown. But the manufacturers of eastern Canada hammered at the Preference quite as vigorously as the manufacturers at Montreal and Toronto, and, like them, asked for higher protection against imports from both the United States and Great Britain. On this eastern Canada tour there was only one commendation of Mr. Chamberlain's scheme for interweaving the fiscal systems of Great Britain and Canada so that there may be mutual preferences.

Electoral Injustice in Germany

The remarkable series of Socialist meetings recently held in Berlin

has called attention to electoral injustices in Germany in general and in Prussia in particular. Germany's legislature, the Reichstag, has, as a principle for distribution of seats, the basis of local populations throughout the Empire four decades ago, and the result is that the present representation of parties bears no relation to their numerical strength. This is specially noted in the most populous division of the capital, which, with over half a million voters, returns one member; so does the crowded suburb of Charlottenburg, with its outlying towns, all now practically a part of Berlin. Unjust as this is on a basis of mere population, it is doubly so when it is remembered that most of this population is radically inclined, and represents what is known in Germany as the Social Democracy. Taking the broad question as it affects the whole Empire, the Socialists, now polling three million votes, have but eighty-one members in the Reichstag, while the Conservatives, with less than a million votes, have fifty-five seats, and the so-called Center party, composed of Roman Catholics, with only 1,750,000 votes, holds a hundred seats. In the Kingdom of Prussia, however, by far the largest, richest, and most influential division of Germany, the condition is still more unjust. Among the 433 members of the Prussian Landtag there is not a single Social Democrat, and yet Berlin, the capital of Prussia, as it is of Germany, is the headquarters of the Social Democ-The Prussian Landtag is divided into two chambers, the Abgeordnetenhaus, or House of Deputies, and the Herrenhaus, or House of Lords. Every Prussian who has attained his twentyfifth year and is qualified to vote for the municipal elections of his place of domicile is eligible to vote as an indirect elector. One direct elector is elected from every 250 souls. These indirect electors are divided into three classes, according to the respective amount of direct taxes paid by each, arranged in such manner that each category pays one-third of the amount of direct taxes levied on the whole. The first category includes all electors who pay the highest taxes, to the amount of one-third of the whole; the second, those who pay the next highest amount down to the limits of the second third; the third, the lowest taxed, who together complete the last class. The practical result of such a system is that a few wealthy voters may constitute the first class and may designate as many electors as would be chosen by thousands of workmen who form the third class. Under such conditions it is easy to explain the protests that have been heard in Berlin at the nearly hundred meetings held there.

•

The Land Question in Russia

Last week a delegation of Russian muzhiks, or peas-

ants, went to St. Petersburg to gain the Emperor's personal assurance that the land question in Russia would not be settled by the present Government, but by the Duma, or Parliament. The delegation was received in audience by the Prime Minister, who pointed out, as reported, that the agrarian problem could not be solved by a division of the State lands alone (amounting only to sixteen million acres, much of which is forest land), but that the muzhiks must be prepared to buy private lands on the easy installment plan provided by the Imperial manifesto of November last. Count Witte, however, had already received information, according to report, from forty-five Governors-General, regarding the causes of the recent agrarian disorders. Twenty-seven of these officials attributed them to the revolutionist propaganda in general, but eighteen declared them to be almost wholly due to the scarcity of land. There was some threat, therefore, in the answer to the Premier by the spokesman of the

delegation that the peasants were determined to get land purely as a gift from. the Government. The muzhiks constitute four-fifths of Russia's population. They have submitted for a number of years to an economic condition which has increasingly impoverished them. They are not so unfit to face a political crisis as is supposed, because for centuries they have been accustomed to local economy in their mirs or village communes. Their definite entrance upon the field of action is perhaps, next to army disaffection, the most serious feature of the present situa-It is, moreover, closely allied to army disaffection, as most of the Russian soldiers come from peasant families. The soldiers in Russia proper have been kept in remarkably good discipline of late; not so those in Siberia. At Vladivostok there has been a bloody mutiny both of artillery and of marine reserves men thoroughly undisciplined, who have been clamoring for immediate transportation home. This mutiny, and also another at Chita, has now been quelled, but the Russian army has lost in prestige by the outbreaks.

®

Religion and Education in China

During the past week some disquieting events

happened in China regarding foreign relations with religion and education there. At a point across the river from Canton, and within a few yards of American gunboats, the Rev. Dr. Beattie, an American missionary, was attacked, how seriously is not known. At Changpu, a place perhaps thirty miles southwest of Amoy, the Roman Catholic and English Presbyterian buildings, valued at fifty thousand dollars, were destroyed by rioters. Amoy and Changpu are in the province of Fukien, one of the provinces of which Tuan-Fang, one of the Imperial Chinese Commissioners now in this country, is Viceroy. As to Protestant propaganda, Fukien is covered by the co-operation of the independent London Mission, the English Presbyterian Church Mission, and that of the American Board of the Reformed Church, the territory being apportioned in such manner as to avoid waste of

missionary effort. In view of the general anti-foreign feeling, and in particular of the boycott of American goods, which extends in special severity south from Shanghai to Canton and west to Hankau, these events have called forth considerable apprehension, now somewhat allayed by the news that the American Mission at Changpu was uninjured: this might indicate that the disturbance there was local in character. In an interview last week Dr. Hoare, the English Bishop at Hongkong, declared, as reported, that the outlook seemed more serious, in South China at least, than before the Boxer rising. We can hardly believe that this is true. Turning to North China, we have to chronicle another event of significance in the summary dismissal last week by Yuan-Shi-Kai, Viceroy of the metropolitan province of Chili (and probably the most influential man in the Empire), of Professor Tenney, an American educator of note. seems surprising that an official who for the past five years has been distinctly pro-foreign in his policy should now apparently reverse it. It shows how strong the tide of public opinion in China is when even the supposedly allpowerful Yuan-Shi-Kai cannot stem it.

æ

As expressed by various Chinese manifestoes recently issued Restrictions by local officials throughout the Empire, anti-foreign and especially anti-American feeling would seem to have increased. Some of these manifestoes declare that the boycott, if rigidly enforced, would drive Americans to forego any exclusion of the Chinese. While Mr. Rockhill, our Minister at Peking, has pointed out the falsity of this view, he has endeavored to check the growing anti-American feeling. The effect of the various local manifestoes has now been emphasized by an Imperial edict commanding the Viceroys to submit reports regarding the number and nationality of the missionaries in all the provinces, also by the Government's promulgation of regulations for the administration of the recently opened port of Chinan, regulations to be enforced in all the new settlements, including, of course, those

They provide that no in Manchuria. lands may be purchased by foreigners, that the leases of lands to foreign tenants shall be restricted to thirty years, that the rentals shall be fixed by the Government, that it shall supervise the general policy of the settlements, levy the taxes, and control the postal and telegraph systems and the public works. Thus, in the future, new foreign settlements will differ in status from the old treaty ports which were practically foreign territory. growing spirit of normal nationalism in China is, we believe, to be welcomed, not deprecated, by the Powers, but when it is accompanied by rioting, arson, murder, and other offenses against law and order, it may call for international intervention, if national control be not sufficient. Informal representations regarding the Chinese situation have already been exchanged among some of the European Powers. Thus far, however, the American Government has not unnaturally been loth to consult foreign nations regarding the subject, because of the general feeling among them that we have unfairly discriminated against the Chinese. We are in danger of paying dear for that unjust and un-American discrimination.

۹

The Chinese Exclusion
Act
Whatever part the drastic application of the Exclu-

sion Act may have had to do with the anti-foreign events in China last week will, we trust, be lessened by the action now taken by Secretary Metcalf, of the Department of Commerce and Labor, in approving the report, just completed, providing for a radical revision of the regulations under which Chinese may enter and live in the United States. This report was drafted by Assistant Secretary Murray, Solicitor Sims, and Mr. Richard Campbell, of the Bureau of Immigration; it touches, by way of either excision or amendment, twentyfour of the existing regulations. the changes are made in the direction of liberality. Certain alterations are made promising to avoid delay in landing Chinese who apply for admission, and others have been made with a view to

avoid the appearance of any action that would seem offensive, provided that the object intended could be accomplished otherwise. One of the most offensive of the practices which have been abolished is the use of the Bertillon system of identification, which subjects respectable Chinese to the humiliation of being treated like criminal suspects. Another alteration is a requirement that the administrative officers should advise the Chinese, either laborers or of the exempted class, before their departure from America for China, of the conditions on which they would be admitted on their return here; certainly no Chinese should be allowed to depart from America under a mistaken impression that he will be readmitted as a matter of course. A desirable provision has also been made for notification of the Chinese to whom admission at the ports of entry has been denied of their right to appeal from this denial to the Secretary of Commerce. Finally, precaution must be taken, according to the regulations, to inform the Chinese consul, if there is such an officer at the port of entry, of the adverse action of the officers at such port in the case of any Chinese person, so that the consular officer may have the opportunity, should he deem such a course necessary, to employ counsel, or otherwise interest himself in behalf of his countryman. These provisions are all very well, but, in our opinion, they do not go far enough. Immediate attention may well be given to the desire of the Chinese that the American Government should accept as final a certificate issued by our own consuls and agents in China, unless there is conclusive proof that it is fraudulent. In this connection it is a fortunate thing for our Government that the character of our consular service in China has recently been improved.

Professor Harnack In addition to his duties as Professor of Ecclesiastical History at the University of Berlin, Dr. Adolf Harnack has for some months been Director of the Royal Library. A report has recently become current that Professor Harnack's new distinction involved a forthcoming aban-

donment of his professorship. From a personal letter just at hand it gives us pleasure to announce that this is not the case. Dr. Harnack writes: "I have not given up my professorship, but am continuing it to the full extent of my work as a teacher. That professorship is, as ever, my chief duty and office. The general direction of the great library I regard as an office very subsidiary to the duties which I have hitherto discharged." Replying to other rumors, Professor Harnack says: "My lectureroom is not becoming more and more empty, but more crowded. Students who are under the influence of the religiohistorical method will never forsake my lecture-room, since I have always followed this method. My 'Lehrbuch der Dogmengeschichte' shows that I have always highly prized the influence of the Greek spirit and of Greek institutions on the Church. Twenty years ago I pointed out that dogma was a work of the Greek spirit built upon the foundation of the Gospels. While I admit that in these last years the so-called religiohistorical method has become somewhat over-audacious, which I deem unjustified, the method itself is right. The silly rumors have been circulated by my orthodox opponents. . . . Never will I forsake a field of work in which for thirty-two years I have labored, and which is now in full fruition." Many have benefited by the reading of Professor Harnack's great "History of Dogma," or by his latest book, "Das Wesen des Christenthums." translated under the title "What is Christianity?" Many, too, have been listeners in Dr. Harnack's crowded lecture-room, and have come under the spell of his stimulating pres-The overwhelming majority of all these will, we believe, read with gratitude that the rumors concerning Dr. Harnack's retirement from his professorship are entirely untrue.

6

The Ethical Revival has not abolished football. The vote of the Overseers, which was at first interpreted as an enactment against the game as an intercollegiate sport, was only a

request proffered to the University's athletic committee. The Overseers, who compose that branch of the governing body that is elected by the alumni, claim no jurisdiction in the matter. The fact remains, however, that the Overseers had not even protested against athletic abuses until they became insupportable. Harvard faculty has now joined the Overseers in protest against the present game of football. They have expressed the opinion that it ought to be discontinued as an intercollegiate contest until it is satisfactorily reformed. This action but adds to the evidence that university authorities have in the past been delinquent in guiding the ethical ideals of the student body. Among such authorities, however, President Eliot, of Harvard, has been a distinguished exception. His very severe criticism of football in his recently issued annual report has been greeted as an unusual production. In fact, it is but the repetition of an opinion that he has many times officially and unofficially expressed. One does not need to agree with him to recognize the high sense of responsibility with which he has for years discussed the social ethics of undergraduate life. He declares that football cultivates unnecessary danger, violations of rules, underhand methods, unfairness, deliberate brutality in the players, brutalizing passions in the spectators, and wrong standards of courage. For this reason he regards it as "wholly unfit for colleges and schools." He sees its evils descending to the secondary schools and there "working great moral mischief." He concludes that it is "childish to suppose that the athletic authorities which have permitted football to become a brutal, cheating, demoralizing game can be trusted to reform it." it childish to hope that the university authorities which have tacitly acquiesced in the degradation of intercollegiate athletics will become stimulated by such leaders as President Eliot and by public opinion to make not only the standards of scholarship but also the standards of athletic conduct a matter of their concern? In the meantime the new Rules Committee have been formulating new regulations for the game. In the West the resolutions of the conference on football held by the nine universities athletically most prominent have been under consideration by the various institutions. The University of Michigan has found itself hampered in dealing with the question of professional coaches by the existence of a contract with the present football coach. Some of the resolutions have been ratified: others are awaiting action The present turmoil about football is the promise of a keener moral sense in academic circles concerning sportsmanship—which simply moral conduct applied to athletic • contests.

In the three months' Sunday Afternoons at Union Seminary

course of sermons now being given on Sunday afternoons at the Union Seminary Chapel on "The Christian Doctrine of Faith," Professor Mitchell, of Boston University, recently spoke on "Faith and Biblical Criticism." That some good people accuse Biblical criticism of being dangerous to Christian faith he attributed to their misunderstanding both of the nature of faith and the results of criticism. The Bible, said he, represents faith as the receptive attitude toward God of a soul prepared to experience the grace of God, and as the prerequisite and condition of a godly life. Of the development of faith, thus understood, the Bible is a record. The traditional belief about the Bible is in no sense faith, and the results of its scientific revision are eminently conducive to the faith which is a joyous confidence in These points were illustrated from God. the Old Testament at length and strikingly, in showing that the traditional belief exhibited revelation not only as discontinuous, but at times even contradictory and regressive. On the other hand, the Biblical criticism conducted by Christian scholars had demonstrated. first, an unbroken continuity of revelation, and, next, its continuous progress. The false issues that had been raised between faith and reason, and again between faith and science, are now raised, said Professor Mitchell, between faith and the criticism whose candid study of the Bible serves to confirm with

fresh proofs the ancient faith in the living God, ever raising up his prophets and interpreters to meet the crises of faith amid emergencies. Professor Mitchell's discourse, while not alluding to his recent experience, inevitably deepened the surprise caused by the refusal of the Bishops, on the ground of alleged dangerous tendencies in his teaching, to approve his re-election to his chair. It is now stated that the President of Boston University recommends that election to professorships be no longer conditioned on the Bishops' approval. Similar action in similar circumstances was taken some years since by Union Theological Seminary, in canceling the agreement which conditioned the election of professors on approval by the General Assembly. On the following Sunday Professor Palmer, of Harvard, took up another timely subject of present interest, "Faith and Ethics." In an address of uncommon beauty and simplicity, given without manuscript, he exhibited the difference and also the practical identity of religion and morality-morality as effort for the realization of the highest righteousness, personal and social, religion as the attitude of love and reverence toward the righteousness of the Most High. Their difference is that morality is volitional, in the will to fulfill all duty, while religion is affectional, supplying to the will the incentive of a supreme desire. But they are identical in direction to the same end. While all teachers of religion have not yet risen to this view, it is the Biblical view, in which religion and morality are represented as fused together in a common aspiration. By this and other series of public addresses the Seminary is effectively stimulating religious thoughtfulness in the community.

The acquisition by the The Bancroft University of California of the H. H. Bancroft Library collection of historical books and documents of various kinds is an event of importance to that institution and of interest to the whole country. The one hundred and fifty thousand dollars paid for the library is a very moderate sum in comparison to its value, for, from various

points of view, the collection of Far Western Americana which represents the life-work of Mr. Bancroft is invaluable. There does not exist anywhere such an accumulation of historical material of high importance relating to the Pacific slope from Alaska to the Central American States, to the Rocky Mountain district, to Louisiana under Spanish dominion, and to most of the islands of the West Indies. The extent and authority of the material included in this library give it the first position in its own field, and rank it with the foremost collections of Americana. The manuscripts include missals, service-books, grammars and dictionaries of aboriginal languages, land deeds, royal edicts, governmental proclamations, papal bulls and rescripts, accounts and letter-books covering commercial affairs in North and Central America and the enterprises of Russian. Canadian, and American fur companies. There are also a large number of originals and copies of diaries of early American trappers, traders, pioneers, and goldhunters, and dictated narratives of California and Rocky Mountain pioneers, sufficient altogether to fill between 1,400 and 1.500 volumes of manuscripts, 500 of which relate to California. The collection is also rich in printed sources of history, including early voyages, debates, laws, journals, transactions of learned societies of Central America and various American States, maps, atlases, and cosmographies. There are more than five thousand volumes of newspapers and periodicals, and there is also a very rich collection of early imprints and other rare books. The value of the collection from the standpoint of the student of American history is very great, and its acquirement by the University of California is a distinct enlargement of the University's resources.

Forestry in Colorado The gratifying announcement is made that General

William J. Palmer and Dr. William A. Bell have presented to Colorado College the whole domain known as Manitou Park, to be used for a School of Forestry. This fine mountain park, seventy-five hundred feet above sea-level, is situated about twenty-five miles from

Colorado Springs, and contains some fifteen thousand acres, two-thirds of which are covered by forests. With its hotel and cottages, its cattle ranch, its hay lands and excellent water supply, the property is conservatively valued at about \$150,000. The increasing interest in America in the science of forestry and the growing appreciation of its utility are emphasized by this munificent gift. There are at present four important schools of forestry in as many sections of the country-at Yale University, the University of Michigan, the University of California, and at Biltmore in North Carolina. Colorado College school will be situated in the Rocky Mountain region at the foot of Pike's Peak. Forestry conditions vary widely with differences in altitude, climate, relative humidity and dryness. In Colorado, where high altitudes are found even on the plains, where on account of extreme dryness agriculture can be successful only through irrigation. the problems are quite different from those of lower and more humid regions. This section of the Rocky Mountain range must ultimately be converted into forest reserve. It is a fact of great significance, therefore, that in this section of the country, where the preservation of the forests is of vital importance, the study of forestry is to be established upon a scientific basis.

Is the Railway Rate Bill Constitutional?

Congress has, under the Constitution of the United States as interpreted by the Supreme Court, the same power to regulate inter-State commerce as to regulate foreign commerce. This power is limited only by the express provisions or necessary implications of the Constitution itself. It cannot be exercised arbitrarily, nor so as to confiscate property. nor so as to give special advantages to one class or one locality. It ought to be exercised so as to involve as little interference as possible with the perfect freedom of intercourse between the States. The object of Congress should be, not to restrain liberty, but to put an end to those restraints on liberty which are

imposed by great corporations to the disadvantage of small shippers and of the general public. Though some of these principles have been disputed, we think they are really indisputable, and we gave last week, with brief references to some important decisions of the Supreme Court, our reasons for regarding them as indisputable.

It is, however, evident that Congress cannot, in the nature of the case, legislate in detail upon this subject. It is not practicable to prescribe by law what the rates shall be, nor what the classification of freight; both rates and classification of freight must, to a certain extent, be flexible. Recognizing this fact, the Committee in the bill now before Congress has simply provided that all rates "shall be just, reasonable, and fairly remunerative," and has even left it to an inter-State railway commission to determine, whenever complaints are made to it against rates as unjust, not only whether the complaint is well founded, but, if the complaint is well founded, what is the "just and reasonable and fairly remunerative" rate to be thereafter observed as the maximum to be charged. The question has been raised whether Congress has the Constitutional right to delegate to an inter-State commerce commission so large power as is delegated by this act.

The Constitution provides that "all legislative powers herein granted shall be vested in the Congress of the United States, which shall consist of a Senate and House of Representatives." Those legislative powers Congress is not authorized to delegate to any other body. can, however, authorize any body to make the necessary rules and regulations for carrying into effect its legislative enactments, and this is done continually. It enacts patent laws and leaves those laws to be carried out under the Commissioner of Patents; land laws, and leaves them to be carried out under regulations framed by a Land Commissioner; Indian laws, and leaves them to be carried out under regulations issued by an Indian Commissioner. Thus a great body of departmental regulations has grown up which has all the force and effect of law, though it has never

been enacted into law by an act of Congress.

Undoubtedly Congress may similarly enact a law for the regulation of inter-State commerce, and leave that law to be carried into effect by an inter-State commerce commission. This is simply doing in one department what it has done from the foundation of the Government in other departments.

The Supreme Court of the United States has decided, in more than one case, that a general law that rates shall be just and reasonable and that a commission shall decide what rates are just and reasonable is not an illegitimate delegation of legislative power. "There can be no doubt," said the Court in the well-known case of Reagan vs. The Farmers' Loan and Trust Company (Thayer's Cases on Constitutional Law, p. 1745), "of the general power of a State to regulate the fares and freights which may be charged and received by railroad or other carriers, and that this regulation can be carried on by means of a commission. Such a commission is merely an administrative board, created by the State for carrying into effect the will of the State as expressed by its legislation."

The Outlook, then, has no hesitation in answering the question asked in the debate in the House by Mr. Sherley "as to the nature of the power that is conferred on the Commission, whether it is legislative or administrative, and how far the courts may review that action." The Commission is an administrative body, like the Indian Office, the Patent Office, and the Treasury Department; its decisions are simply a part of the administrative machinery of the Government for carrying into effect the will of the people as expressed by legislative enactment. No specific provision is made in the bill for any revision of its decisions by the courts, but the bill recognizes the fact that any decision of the Commission can be brought before the courts by injunction proceedings based on the ground that the rate prescribed is not in accordance with the provisions of the law. And the decisions of the Supreme Court leave very little room to question the two essential affirmations that Congress has

power, first, to enact a law requiring that all railway rates shall be just and reasonable and fairly remunerative, and, second, to leave to an administrative board created for that purpose the power to determine what rates are just and reasonable, and to require the railways to conform to such rates.

The Hepburn Railway Bill is Constitutional.

The Need of Plain Speech

Nothing in life is more tragical than the fall of a trusted man or woman, with its defeat of hope, betrayal of faith, surrender of principle, far-reaching disturbance of moral values for others. When a prominent man turns traitor to those who have put their interests into his keeping and stands forth, in any sudden light thrown on his career, as a selfish user of other people's property, a shock runs through the whole community, young men grow cynical and older men despondent. and the capital of moral health and vitality is sensibly diminished. professional criminals, the open cheats and scoundrels, do not bring moral disaster in the train of their evil deeds; the destroyers of hope and the wasters of moral wealth are the men who stoop to baseness from high positions and make influence and power, which are in their keeping as trustees for others, the servants of their greed or ambition.

It is almost impossible to overestimate the shock to confidence, the disaster to hope, which have come in this country as the result of recent betrayals of trust by men of prominence in public and business life, and it is a mischievous perversion of true compassion which makes respectability and position palliatives of moral offense. There is no offender so naked of excuse as the man who sins from the height of a great place, no betrayer of honor so base as he whose honor is so great that it becomes itself a capital for his use. The common offender is held back by no public opinion, kept in place by no pressure from others, sustained in temptation by no consciousness that others are leaning on

him and that if he defaults morally misery and bankruptcy follow in the train of his collapse; on the contrary, he feels that he is detached from the moral life of the community, that what he does is of little account, that no man trusts him. The great criminal is not he who commits a crime of a magnitude which impresses the imagination, but he who turns traitor in the face of general confidence and universal respect, the man who does not break, at the risk of his life, into other people's houses and take their property, but seizes and wastes property put into his hands by men and communities because he is believed to be honorable. The magnitude of an offense is determined not by the daring with which it is committed nor by its rating on the statute-books, but by the measure in which it involves violation of trust, betrayal of confidence, use of the honor and authority bestowed by others for selfish or base purposes. The individual soldier who goes over to the enemy is a traitor, but his treason is venial compared with that of an Arnold loved and trusted by his chief, holding a post of immense importance because of that confidence, looked upon as a leader by reason of a record of heroism. When such a man falls, he falls like Lucifer, and there is no measure to the infamy which blackens his name on the lips of later generations.

It is high time for clean, clear, decisive moral indignation and judgment; for the resolute clear-sightedness which refuses to be confused by the glamour of position, power, or respectability; which metes out exact justice with a dispassionate hand, and neither bows to the clamor of the hour nor to the appeal of a mercy which would defeat the very ends of compassion. The Nation needs moral reinvigoration, and it will come only when the facts are faced and deeds are described by words which have edge and sting, and men are judged by the measure of the light and faith and confidence against which they have sinned. Out of the shame and depression of recent months one great hope is taking the shape of certainty—there is coming a distinct advance of moral standards, a clear perception of the dullness of

moral feeling which has overtaken politics and business, a determination to tear aside the mask of respectability and compel offenders to stand before the community in the light of their mis-Moral corruption has gone far, but not too far for moral recovery. The vast mass of the people in the country have been sane and honorable; but they have grown morally heedless and careless; they have let the standards fall out of hands too much occupied with individual work and gain. It is time to measure moral strength against wealth and luxury, to hold men who are trusted to a more rigid account, and, when they betray their trusts, to tear from them the shreds of respectability with which sentimentalists would conceal the greatness of their offending.

Not Born to Die

A correspondent sends us the following paragraph written by a skeptical friend of his, and asks us how we would answer it:

Owing to man's irrepressible egoism, the wish is father to the thought. It is man's invincible determination to believe himself immortal that has created the idea of immortality. There isn't a single logical standing-point for the argument. In the Old Testament it is not hinted at. The promises made to the patriarchs are that their seed shall inherit the earth, and almost all the Hebrews of modern times agree with Spinoza in his fundamental thought, that while humanity, the race, endures, the individual unit of which it is composed passes on, giving place to others, as in all the rest of the animal creation.

The wish always is father to the thought, and the child should be nurtured, not cast out. All great thoughts are born of great wishes. Desires are creative; the reason is an instrument to accomplish desires. Man was hungry; his reason told him how to get food that would nurture, not poison, his body. He wished to cross the seas which were impassable barriers; his reason showed him how to navigate them. He wished to communicate with absent friends; his reason invented writing. He wished to extend the intercourse to many readers; his reason invented the printing-press. He longed for some picture of his absent

friend; his reason invented the photograph. He suffered under autocratic despotism; his reason showed him the way to liberty through the organization of free democratic institutions. Tennyson voiced the desire of mankind for peace and a Parliament of the Nations, and a generation has not elapsed before the desire of man has found its way to a Hague International Tribunal, and now to a serious consideration of an international parliament. What good thing is there that man enjoys to-day which he has not first desired and then found his way to possess? What good thing is there that our fathers have desired that we have not found our way or are finding our way to possess? Of course the wish is father to the thought; it is always father to thoughts; and all great desires and all great thoughts lead sooner or later to realization—generally to a realization that transcends the wildest imaginings of the poets and prophets. in the days of the unknown prophet who wrote the first chapter of Genesis dreamed of a world of ocean and mountain, of waterfall and fire and lightning, subdued as man has subdued it in this twentieth century? Who in the days of Plato dreamed of a Republic as free and fraternal as America? who in the days of Christ of a philanthropy as universal in its scope and as effective in its operation as the philanthropy incarnated today in hospitals and asylums and schools and colleges and social settlements?

"The wish is father to the thought." True. And the children are a lusty, vigorous, and thriving progeny. "It is man's invincible determination to believe himself immortal that has created the idea of immortality." True. And what is more, it is showing him the way to immortality. It is a curious non sequitur to argue that man must not expect immortality because he greatly desires it. In fact, desires are God's method of provoking man to achievement; what he greatly desires he eventually attains. And always the achievement surpasses the expectation.

Now are we the sons of God, and it doth not yet appear what we shall be: but we know that, when he shall appear, we shall be like Him; for we shall see

Him as He is. And every man that hath this hope in him purifieth himself, even as He is pure.

The Spectator

The Spectator has been wondering if the time is not ripe for a reformer who will busy himself with certain customs of our modern life; it seems that something needs to be done to rescue them from tendencies all too evidently demoraliz-For instance, take the time-honored custom of making gifts to a bride. This had its birth in the richest and sweetest sentiments of the human heart, and in its original spirit it is yet one of the most beautiful of our common customs; but it not infrequently happens in these days that one is reminded how greatly the beautiful custom has suffered at the hands of its friends.

(6)

A woman was heard to say, "Just think of it! Three weddings in the next two weeks; that means three handsome presents, and I don't give that for one of the brides." And she snapped her fingers significantly. But of course the presents were bought, and sent "with dearest love," and appeared in the extravagant display which a special policeman guarded by night, till it was consigned to the safe deposit vault.

☻

The Spectator happened to read a newspaper report of one of those particular weddings, and he could not help thinking how differently it would have been written if the reporter had happened to know and tell the truth. for his own amusement in a few idle moments he rewrote a part of the report as follows: "The bride had a very few gifts; but there was also a very great display of cut glass, silver pieces, and articles of costly ornamentation, which were left, with total indifference and more or less reluctance, in her keeping. Among these the elaborate vase of Mrs. La Fontaine was very conspicuous."

€

The Spectator happened to show his revised report to a young woman friend,

and of course she promptly called him "a horrid thing." "How can people help it?" she made critical inquiry. "Surely one can't reasonably be expected to love a woman simply because she invites you to her wedding, and in large society weddings people are necessarily brought together who are often but mere acquaintances of the bride, as of one another. Brides shouldn't invite so many people if they don't want gifts grudgingly or indifferently given." The Spectator replied to this that she might be quite right, that this might be a case where "judgment should begin at the house of God," and that the possibly forthcoming reformer would be a bride who would find her earliest inspiration in her own wedding.

☻

The sufferings of a particular class have generally furnished good material for the make-up of the needed reformer, and truly brides have their trials, if not real sufferings, in this matter of presents. One bride, the guests at whose wedding numbered about two hundred, maintained a becoming gratitude and pleasure as the gifts came in, until thirty-two bonbon dishes—surprisingly alike—and six water-bottles—as identical as the same number of peas in a pod-appeared on the table before her. Then she was heard to say, "Mother, if another one of those things comes in, I don't care who sends it, please don't show it to me." Still another, who was to begin her housekeeping in a very small flat, and carry it forward on an income of eighteen dollars per week, faced the almost unanswerable question of what she should do with twenty-seven cut-glass bowlsall of them of good size. It was a question where to place even enough bowls to serve the small family with bread and Finally, a special cabinet, for milk. which there was neither room nor money. had to be purchased to accommodate the bowls and bottles, and other equally useless things which came at the same time. It was recorded, however, of all these things that they were "just too dear for anything," and beautiful and bountiful assurance was given that each one was a most acceptable and important

addition to the belongings of the new home.

G

Equally tender and commendable in its beginning, but even more sadly degraded in its lengthening observance, is the custom of sending flowers to a funeral. It was a most beautiful thing when love, and love alone, made quiet offering of the blossoms of earth to brighten the dark hours of mortal bereavement; but as time has passed on the early beauty of such bestowal seems to have been, at least in very many instances, sadly marred, if not quite obliterated. Remarks heard in this connection indicate the all too prevalent feeling. A husband and wife were discussing the matter with reference to a particular case: a business friend of the man had lost his wife, and the discussion just alluded to came up in regard to sending a floral offering to the house where death had come. The woman was very positive in her expression of disapproval; she argued that they couldn't afford it; that there was no tie between them more tender or binding than that of a business acquaintance; that it really wasn't fitting for them to do it, and that certainly it ought not to be expected.

€,

The man expressed himself in essential agreement; he knew they couldn't afford it, and he admitted there was something very much out of keeping with his own best feelings in sending it; but still it was his judgment that it should be done. He said it would be expected, its omission would be conspicuous, and perchance interpreted unfavorably for them. Then the wife suggested that if they must send something, it should be a simple, inexpensive offering, the cost of which they could better afford. Again the man expressed himself in sympathy with the good sense and good taste of the suggestion, but he also maintained that it wouldn't do: that if they sent anything it must be of a certain style and price; and it was finally so determined.

1

At that particular funeral the display of flowers exceeded even what people are well accustomed to see in these lavish days. So numerous were they that there was little possibility of any sort of arrangement; it was simply pillow upon pillow, wreath above wreath, masses of one sort of flowers against those of another, and emblems uncounted, crowded together with the one evident intent of giving them a place where they would show. It was simply an enormous display, offensive to artistic taste and shocking to all the refinements of the heart; for it was all too evident that a large percentage of the offerings made expressed the same feelings and convictions as the one alluded to.

(6)

The antithesis of this experience was found in another which the Spectator recalls with peculiar pleasure. It was in the coast country of the State of Maine, and the time was midwinter. An aged woman had died; her home had been on a small farm, her means limited, and her friends and neighbors necessarily few. The inevitable cost of the funeral was all that the remaining family could possibly assume; even the outlay needful for a small offering of flowers at that time and place was not to be thought But among the neighbors, near and distant, were some who had one or more cherished house-plants; among them all there were a few blossoms, and on the day of the funeral they were all brought a rose, a petunia, a little old-fashioned pink, a few geranium-leaves, each one giving all she had-and, in love that was tender indeed, laid upon the coffin. Such a little offering it was in itself-the wasted hand of the woman could have held it all; but it was large and lovely enough in what it expressed to be carried into the presence of the angels of light.

3

It appears increasingly difficult to exclude the common commercialism of the time from any of its particular experiences; but it would seem that the supreme hours of human life—the hours in which love is crowned and we take final leave of our dead—that these at least might be held sacredly apart from the insincere, the common, and the ostentatious.

CHINA IN TRANSITION

THE ANTI-FOREIGN RIOTING IN SHANGHAI

BY GEORGE KENNAN

Special Correspondent of The Outlook in the Far East

This is the first of a series of articles in which Mr. Kennan will record his recent observations and experiences in China. Among these experiences was a house-boat trip of nearly four hundred miles through the canals of eastern China. The present article will be followed at once by one dealing with the causes of the various anti-toreign maintestations in China.—The Editors.

F one had been asked two weeks ago what cities of China in this period of transition and unrest were most likely to be exempt from anti-foreign rioting, one would have replied without hesitation, Hongkong and Shanghai. Both of these cities passed through the year of the Boxer troubles without any disorderly manifestations of anti-foreign feeling; both remained quiet in the excitement of the boycott movement; and there was no reason to suppose that there would ever be, in either of them, any serious uprising of the native inhabitants. In China, however, it is almost always the unexpected that happens, and on the morning of Monday, December 18, the foreign population of Shanghai found itself suddenly confronted by a riotous demonstration on the part of the natives, which not only created intense excitement and alarm, but threatened for a time to get wholly beyond control.

The first signs of impending trouble appeared at the Hongkew market in the American settlement, where, early in the morning, gangs of Chinese roughs made an attempt to stop traffic by wrecking the stalls of peaceable hucksters and attacking the servants of foreign residents who had been sent there to buy supplies of meat and vegetables for the day. A little later rioting began on the Nanking Road, and in less than two hours the anti-foreign demonstration, which had evidently been preconcerted, if not carefully organized, became so general and so formidable as to threaten

the safety of foreigners in all parts of the International Settlement.¹

Julian H. Arnold, the American Vice-Consul, was attacked by a mob near the suburban race-course as he was coming into the city; Dr. Scholz, the German Consul-General, and two of his vice-consuls were set upon in the Nanking Road and had to take refuge in Max Nossler's book-store; Dr. McLeod, Dr. Jackson, Mr. Davis, Mr. Forrester, Mr. Anderson. and many other well-known business men were stoned or beaten; and dozens of other Europeans or Americans, in automobiles, in carriages, or in jinrikishas, were stopped and more or less roughly handled as they passed through the streets of the Settlement on their way to their offices. By eight o'clock the great commercial thoroughfares known as the Nanking Road, the Kiangse Road, the Szechuen Road, and the Maloo, were packed with excited Chinese, and thousands of rioters, armed with sticks and stones and in some cases with revolvers. began to mob foreigners, maul policemen, loot shops, and set fire to buildings in the central part of the Settlement, between Defense Creek and the Bund. The places most fiercely and persistently attacked were the shop of the Interna-

The part of Shanghai controlled and partly occupied by foreigners is sometimes called the International Settlement and sometimes the Foreign Concession. It is situated on the western bank of the Whangpoo River, above the junction of the latter with the Yangtse, and has an area of two or three square miles. It contains a population of 8,000 or 9,000 Europeans and Americans and about 350,000 Chinese. The Native City, which is surrounded by a wall and which stands just south of the Concession, had, in 1900, a population of 152,000.

tional Bicycle Company, where Winchester rifles and ammunition were kept for sale; the Louza police station, to which a few arrested rioters had been taken early in the morning; the town hall and library on the Nanking Road, and the annex of the Metropole Hotel. The employees of the Bicycle Company made a vigorous defense, and, after killing several Chinese on the very threshold of the shop, succeeded in repelling the attack; but before the foreign residents of the city could collect force enough to hold the yelling, stone-throwing mob in check, all the windows of the town hall had been shattered, the annex of the Metropole Hotel had been wrecked and partially burned, and the Louza police station had been captured, set on fire, and completely destroyed.

Inasmuch as the European and American population of Shanghai does not exceed nine thousand, while the Chinese living in the Foreign Concession and the Native City number more than half a million, the consequences of anything like a general foreign uprising might be disastrous in the extreme, and it was therefore with a feeling of intense apprehension and alarm that the foreign residents of the Settlement went for their weapons. The Shanghai Volunteers, a local militia organization numbering six or eight hundred men, assembled hastily, with rifles and bandoliers of cartridges, but without uniforms; messengers were despatched to all the war-ships in the river asking for help; squads of Sikh police were sent to check the march of the rioters down the Nanking Road and to seize and hold the bridges over Soochow Creek; and every European or American who had a rifle, a shot-gun, a Mauser pistol, or a revolver, rushed into the streets, and either reported to the municipal authorities for orders or hastened to the scene of disturbance to fight independently.

Before nine o'clock the whole native quarter was swarming like a disturbed ant-hill, and it is not an exaggeration, perhaps, to say that within the limits of the Central District, between Defense Creek and the Bund, there were two hundred thousand excited Chinese in the streets. It soon became apparent, how-

ever, that nine-tenths of these people were not participating in the riot, and that the few thousands who were actively engaged in it lacked cohesive organization and courage. They would yell frantically, throw stones, loot an undefended shop, or maul a Sikh policeman to death with bamboo poles; but when the Volunteers opened fire on them with ball cartridges they lost their nerve and gave way. They did not venture to kill a European outright, even when they had him in their power. If they happened to catch an Englishman alone and unarmed they stoned him, smashed his carriage or jinrikisha, and perhaps beat him; but they always stopped short of murder. The only foreigners actually killed were Sikh policemen from India, whom the Chinese hate with a deadly hatred. Between nine and ten o'clock in the forenoon strong landing parties of marines and blue jackets came ashore from the British cruisers Astræa and Bonaventure, the Italian cruiser Marco Polo, the German gunboat Vaderland. and the British gunboat Clio, and, with a dozen or more machine guns, took positions in front of the consulates and public buildings, or marched in squads to the parts of the city where the disorder was greatest.

Coming down from Peking by the Tientsin steamer Shengking, we happened to reach Shanghai a few hours after the rioting began, and upon landing at one of the many docks which fringe the beautiful European boulevard known as the Bund, we found ourselves, to our great amazement, in what seemed to be a besieged city. The consulates and public buildings were all guarded by troops; squads of marines and bluejackets, with rifles over their shoulders, were marching along the water front and wheeling into the Nanking Road; armed volunteers in civilian dress, with bandoliers of cartridges across their breasts, were going to or from "the front" in jinrikishas or on foot; gray-haired British merchants were riding to their places of business in carriages or automobiles with rifles or double-barreled shot-guns by their sides; and even the bicycleriders who went scurrying along the Bund carried big navy revolvers in hol-

sters belted about their waists. whole foreign population, apparently, was under arms, and had either been engaged in fighting or was ready to fight at a moment's notice. Upon inquiring what had happened, we were informed that the Chinese, excited by certain proceedings in the Shanghai Mixed Court, had begun an anti-foreign riot and were engaged in looting shops, burning buildings, and killing Europeans and Americans on the Nanking Road and in various other parts of the International Settlement. Volunteers had been called out, and marines had been landed from all the war-ships in the river, but the whole force available for defense did not exceed fifteen hundred men, and if the native uprising should become general the situation of the comparatively small body of Europeans in the Settlement might be as perilous as that of the foreigners in Tientsin in 1900.

This was somewhat alarming news. but as the people on the Bund did not seem to be wildly excited, and as we could hear no sound of yelling or firing, I concluded that the danger was not imminent, and directed the porter of the Astor House to collect our baggage and call 'rikishas. 'Rikishas, however, were not to be had. The Chinese coolies were all on strike or with the rioters, and the only vehicle available was a closed baggage-van, which had no seats, and looked like the "Black Maria" of a city prison. Making a virtue of necessity, we climbed cheerfully up on our trunks, took our grip-sacks and shoulderbags in our laps, and rode slowly to the hotel, like a couple of wild animals in a closed menagerie cage. We found the Astor House full of British and American round-the-world tourists, who were assembled in little groups in the office, the reading-room, the bar-room, and the parlor, discussing the latest news from the scene of disorder, and the probability of a general Chinese attack in the darkness of the coming night. Here and there young Volunteers who had just returned, rifle in hand, from the Nanking Road, were describing to excited and apprehensive women the siege of the Town Hall and the fierce attack of the mob on the shop of the International

Bicycle Company; and at the office desk, where I went to register our names, the manager of the hotel was imperiling the safety of half his guests by helping an American tourist to load a Mauser automatic pistol. Neither of them knew anything about the mechanism of the weapon, and, after dodging two or three times out of the probable line of accidental fire, I went to their assistance, boldly declared myself a firearms expert, and, for the sake of getting behind the gun, offered to load it myself. From my point of view-opposite the muzzletwo novices co-operating in an attempt to fill the magazine of an automatic pistol were much more dangerous than a Chinese mob.

When we had taken our hand baggage to our room, I came down stairs and walked through the hotel, asking questions right and left, listening to scraps of excited conversation, and trying to get an intelligible explanation of the riotous outbreak which had so suddenly transformed a peaceful commercial city into what seemed to be-or threatened to become—a field of "battle, murder, and sudden death." None of the excited groups in the parlors and corridors had any definite information with regard to the cause of the riot, but suggestions for dealing with it were abundant. "What they ought to do," said a loud-voiced American in the office, "is to take out the Taotai [the Chinese prefect or governor of the city and lynch him!" "Yes," said another, "either lynch him or put him in irons and send him on board one of the war-ships." I could not see myself how murdering the Governor, or sending him on board a warship in handcuffs and leg-fetters, would greatly improve the situation, but such were the suggestions of two of my countrymen who seemed to be rational, and who were apparently men of education and good social position. No question was raised as to the Taotai's responsibility for the riot, nor did anybody seem to care what the grievances of the Chinese were—if they had any. An attack had been made upon the foreigners, therefore the Chinese Governor should be lvnched !

Late in the afternoon I put a pistol in

my pocket and walked out in the direction of the Chinese quarter. The streets everywhere were crowded with natives most of them coolies—and there were strong squads of marines, or Sikh police, on the bridges and at the intersections of the principal "Roads." But the rioting had apparently ceased, and although many shops in the central district were closed, I heard no firing and could see no signs of disorder. All the Europeans whom I met were armed, but many of them were returning to their homes; and in reply to questions they said that the killing of twenty or thirty men had cowed the disorderly element, and that the trouble, for a time at least, was over.

Throughout Monday evening the feeling among the foreigners in the Settlement was one of great anxiety and apprehension. The riotous demonstration had been checked, and at a comparatively insignificant cost in life; but the hundreds of thousands of Chinese who had thus far taken no part in it were in a state of wild excitement. The attitude of the local native authorities was uncertain, and the anti-foreign movement might at any moment become general and assume a dangerous form, as it did in the north of China in 1900. Nobody in Peking or Tientsin would believe at first that the Boxer movement was really formidable; but it developed into a great popular uprising, nevertheless, and the same thing might happen again. The foreign residents of Shanghai, therefore, prepared themselves, as far as possible, for a renewal of hostilities, upon a more extensive scale. The family of the American Consul-General, and many other people who had been living in lonely and isolated places on the Bubbling Well Road, came in to the Astor House for safety. The Country Club, near the center of the suburban residence district, was turned into a place of refuge for women and children, and was put under guard of a strong detachment of Volunteers; and all strategic points between the native quarter and the foreign part of the Settlement were occupied by Volunteers, Sikh police, or squads of marines with machine guns.

The Astor House, until after midnight, was filled with excited men, mostly

armed, who had come in to get news, or to discuss the events of the day, and the air, of course, was filled with disquieting rumors and reports. The Chinese, it was said, were holding tumultuous meetings in the Native City and working themselves up to a frenzy over the killing of their countrymen in the streets; they had obtained two or three thousand rifles and a large supply of ammunition by breaking into a native arsenal; and they were preparing to make an overwhelming attack upon the foreign quarter at a late hour of the night. War-ships of the Powers had been sent for and were coming at top speed from Weihaiwei. from Hongkong, from the lower Yangtse, and from Japan; but twenty-four hours, at least, must elapse before any of them could arrive, and in the meantime only the Volunteers and a few nundred bluejackets and marines stood between the foreign population and half a million infuriated Chinese. Although I took these rumors with many grains of salt, I did not feel at all sure, myself, that the trouble in Shanghai was over. I had just come from Peking and Tientsin, where I had heard all the details of the Boxer siege; I was aware that the anti-foreign feeling in the Yangtse valley had been greatly increased by the boycott; and I knew so little of the grievances of the Shanghai Chinese that I could not tell what they were likely to do after twenty or thirty of them had been killed by foreign troops.

Just after I returned to my room, a detachment of marines passed under my window, dragging a two-inch quick-firer in the direction of the Nanking Road; and as the rumble of the wheels died away up the street, I went to bed, more than half expecting to be awakened before morning by the yells of a mob and the rattle of rifles and machine guns.

Contrary to all expectation, the night passed without any general alarm, and when I went out after breakfast the city in the neighborhood of the Astor House seemed to be perfectly quiet. Everybody was still going about armed, the bridges over Soochow Creek were all guarded, and a detachment of marines in front of the German consulate had trained a big brass machine gun so that it would sweep

the whole street in front of the hotel; but with these exceptions there was nothing to indicate that the normal life of the city had been disturbed. When, after a walk of five minutes, I reached our consulate. I found the building guarded by a force of two small Japanese bluejackets. There was a fairly strong American fleet in the Far East, including several battle-ships; but when the rioting in Shanghai began, the nearest of our vessels was a hundred and fifty or two hundred miles away; and in order that American interests should not be left wholly without protection, the Japanese consul loaned us two armed men, out of his total available force of twelve! I presume he thought that by giving us two bluejackets to stand in front of our consulate he would help us to "save our face;" but he could not prevent the British residents from chaffing us a little upon our consular guard of two Asiatics, and our inability to land marines until Wednesday afternoon—sixty hours after the rioting began.

In reply to my inquiries, our Consul-General, Mr. Rodgers, said that the American cruiser Baltimore and three gunboats were up the Yangtse, at or near Chingkiang, and that he had informed them of the riot by telegraph early Monday morning. He had also kept the Department in Washington advised, and had cabled Admiral Train at Manila. He did not think that the situation in Shanghai was at all critical, but he expressed great anxiety with regard to the safety of the American missionaries "up country." There was a strong anti-foreign feeling among the Chinese of the Yangtse valley, and he greatly feared that as soon as the news of the Shanghai outbreak reached the cities on the Grand Canal—particularly Soochow, Hoochow, and Hangchow—the missionaries there would be attacked and possibly murdered. He had, therefore, wired them all to come down to the coast for shelter and protection.

When I returned to the hotel, I found a lot of new rumors in circulation. Rioting, it was said, had broken out afresh in three places, and the disorder was greater than ever. A reinforcement of marines had just arrived in the German

gunboat Tiger; the American cruiser Baltimore had reached Woosung; and a fleet of torpedo-boat destroyers was coming post haste from Manila (1). Meanwhile, the rioters had been reinforced by an army of brigands and sait smugglers from the back country, thousands of ruffians and rowdies had come across the river from Pootung, and the outlook generally was very alarming. These wild reports, of course, were almost wholly without foundation; but a reference to them may serve to indicate the nature of the mental and emotional atmosphere in which the guests of the Astor House lived for two or three days. No rumor seemed too wild to gain credence, and intelligent men assured me, with an air of conviction, that Admiral Train had sent a fleet of destroyers from the Philippines, and that three fast British cruisers had come from Hongkong (a distance of eight hundred and fifty miles) in thirty hours! As matters of fact, the Baltimore did not reach Woosung until Wednesday; the torpedo-boat destroyers and British cruisers did not come at all; and the rioting on Tuesday was limited to an attempt, on the part of a few hundred Chinese roughs and hoodlums, to prevent market sales and force Chinese merchants to close their shops on the Nanking Road, the Boone Road, and the Maloo. When I walked out to this part of the city, a little later, there were great crowds of Chinese in the streets, but I saw no rioting or disorder. That night, however, just after twelve o'clock. a general alarm was sounded from all the bell towers, and the whole foreign community was again thrown into a panic by an announcement from the police headquarters that the Chinese, in strong force, were advancing on the Settlement from the west. They had driven in the police outposts on the Sinza Road; they were already close to the General Hospital, if not actually in possession of it; and they were setting fire to everything as they marched down the right bank of Soochow Creek in the direction of the Bund. As this startling news came from police headquarters, and as the whole western sky was lighted up by what seemed to be the glare of

an extensive conflagration, the marines and blueiackets assembled hastily in front of the British and German consulhurrying along the Bund at the doublequick; machine guns were got in position on the Garden Bridge and in front of the Astor House; the fire brigade turned out; and the whole region bordering on Soochow Creek became a scene of great activity and excitement. In the course of half an hour mounted scouts who had been sent out to locate the enemy reported that they could find no "Chinese army," but that a large number of native houses, set on fire, presumably, by the rioters, were burning briskly in the district known as Sinza. The fire brigade went up the Creek and after an hour of hard work put out the incendiary fires; the marines and bluejackets on the Garden Bridge and in front of the Astor House went back to their consulates; and the citizens and tourists who had been roused by the general alarm returned to their beds.

On Wednesday the situation began to clear up, and the anxiety of the foreign population was to some extent relieved. The American gunboat Villalobos came up the river to the city with one hundred and seventy bluejackets and marines from the cruiser Baltimore; the Taotai, Duke Tsai-Teh, and other prominent Chinese officials went personally through the native quarter with guards and footmen carrying printed proclamations ordering the people to remain quiet; the Viceroy, Chou-Fu, telegraphed from Nanking that he was on his way to Shanghai with instructions from the Imperial Government at Peking; and the Chinese newspapers published strong editorials condemning the rioters and urging all patriotic citizens to discourage violence and await a peaceful settlement of the Mixed Court trouble.

At the present time (Friday evening) the anti-foreign demonstration seems to have spent its force, and there is no reason to anticipate a renewal of the The city is well guarded and efficiently patrolled, and the military force now on duty seems quite adequate to cope with the disorderly element, which never comprised more than a

fiftieth part of the total Chinese population.

In their dealings with the mob on ates; detachments of Volunteers came Monday and Tuesday the foreigners, it seems to me, showed commendable prudence and self-restraint. They did not open fire on the rioters until further delay would have been suicidal, and they never brought into use either artillery or machine guns. It would have been easy to "give the Chinese a lesson" by slaughtering two or three hundred of them indiscriminately in the streets; but, so far as I have been able to ascertain, the officers of the Volunteers and marines never once lost their heads in the excitement, and never ordered their men to fire unless it was absolutely necessary to do so. result of their coolness and discretion the Chinese casualty list is comparatively small, and comprises only men who were in the fighting line and who actually had sticks, stones, or deadly weapons in their

The secretary of the Municipal Council, who acts also as correspondent of the London "Times," cabled that journal that Japanese had been seen among the rioters, and had given the latter aid and encouragement. The same statement was made, without reservation or qualification, by the "China Gazette," and by several foreigners with whom I talked, but I failed to get any evidence of the alleged fact which was worth a moment's consideration. Hundreds of Chinese students have come back from Japan wearing the Japanese student dress, and it is quite likely that some of these young men were among the rioters, and were mistaken by foreign observers for subjects of the Mikado; but, so far as I have been able to learn, no real Japanese had anything whatever to do with the disturbance, either directly or indirectly.

Since I arrived here, five days ago, I have succeeded in getting from officers of our consulate, from Chinese officials, from members of the Municipal Council, and from representative business men, a fairly clear and intelligible explanation of the riot; and as it illustrates certain methods and tendencies which prevail in China generally, and in the treaty ports in particular, I shall devote another

article to the trouble in the Shanghai Mixed Court, which lighted a flame of wrath and indignation in the hearts of all Chinese, high and low, and which led, ultimately, to the anti-foreign demonstration. If we are going to try to extend our commercial interests in China,

or even to do business there during the next ten years, we shall have to try to understand the Chinese and their way of looking at the dealings of foreigners with them; and the Mixed Court fracas is a most instructive object-lesson.

Shanghai, Friday, December 22, 1905.

THE RUSSIAN PRIESTS IN THE REVOLUTION

FROM A CORRESPONDENT IN RUSSIA

HE only Russian priest who has become known to the whole world in these revolutionary times is Father Gapon, a man in every way exceptional. Nevertheless, there are many other priests all over Russia who have shown active sympathy in one way or another towards the great movement that is reorganizing Russian society. From the three common priests who gave their approval openly to the Kronstadt mutineers, to the Archbishop of St. Petersburg who protested against their execution, there is every shade of political and social creed.

Tolstoy has made the world familiar with the idea that the religious sentiment in the Russian people must play a great part in the building up of the new Russian State. Since the development of the open revolution it has become evident that the position of the great wing of the Russian Church which might properly be called the Russian Protestants, and which is known as the "Old Believers," is of the greatest importance, and must be considered even at this moment of intense revolutionary crisis. The Government appreciated the power of the "Old Believers," and it granted religious liberty largely on account of pressure brought to bear from this quarter. The Government's immediate reward was a very considerable financial backing from the wealthy "Old Believers" of Moscow. The particular element of the "Old Believers" that furnished aid to the Government at this early stage of the revolution, before the latter had granted any substantial liberties to the

people, might be termed reactionary rather than progressive.

The "Old Belief," however, like other religious movements, has developed under persecution. At the outset it was a protest against the form of the Russian religion—a simplification of the rites of the Church. Continued persecution has prevented the formation of a well-centralized, natural organization and the establishment of tradition, and so has forced the development of independent, individual thought and religious feeling. The consequence is that to-day the Old Belief is strong, multiform, and manysided. Though its adherents are often very dogmatic, and are usually more deeply imbued with the prejudices of creed as well as with religious sentiment than the great unthinking mass of the orthodox, still religion is with them a vital thing which they have had to de fend against the Government and persecution. It is therefore largely among the Old Believers that new political and social creeds have found root.

Religion, then, is not the dead thing it would be in Russia without this schism and the many spontaneous sects that have grown up during the last century. And now, besides the sudden liberation of the "Old Believers," has come the removal of Pobedonostseff, the dead hand, from the helm of the official orthodox Russian Church. In looking about for the deepest currents of Russian feeling, nothing is so remarkable to-day as the bitter hatred on all sides of Pobedonostseff. This is by no means decreased since his removal from office, for it is

known that he remains an intimate adviser of the Czar. For many weeks if one bought a satirical paper on the street it was Pobedonostseff's cadaverous features that figured as the chief butt of the cartoonists; if one read a view of the reactionary attitude of the Government, it was against Pobedonostseff as much as Trepoff that the shafts were directed; if one went to the theater to see the farce, "The Days of Liberty," it was for the part of Pobedonostseff that the best actor was cast, and he who received the wildest roar of popular disapproval.

Let us try to feel for a moment the dead weight which this political and religious high priest placed upon the Russian religion. Let us recall that not only did Pobedonostseff attack the modern school and the modern newspaper, but that he went so far as to call inertia the fulcrum of progress. What an inversion of common philosophy—what blindness to the teachings of history! Is this not either the acme of egoistic perversity or incipient madness? Then let us not forget that this man was for years the most trusted adviser of the Czar. But Pobedonostseff is removed, and the Russian priesthood has commenced to breathe.

Never out of contact with the people below, never free from the most constant petty criticism on the part of the very peasants themselves, the Russian "popes" have now at least been emancipated from the paralyzing pressure, not to say terrorism, from above. There are many signs that the great Russian priesthood with its hundred thousand peasant "popes" (for they are not far removed from the peasants) is beginning to think. There are many proofs that the "popes" are sympathetic, on the whole, with the idea of a thorough renovating and reorganization of Russian society. One of the most direct is the latest and most intelligent declaration on the duty and position of the priests during the great revolution Russia is now passing through.

Some weeks ago the Russian Church Herald, the "Zerkowni Vestnik," published a leading article on the new duty of priests.

"The duty of the priests toward the

Duma," this article said, "is to explain to the people the overwhelming importance of a serious and honest attitude towards the election and towards their future participation in the political life of the country; to make clear the great sin which the peasant would commit towards his soul if he should in this matter trade the suggestions of his conscience or his intelligence against personal profit or fear."

A new brochure which has attracted the widest attention expounds and develops in a most intelligent and interesting way the same idea. The priest must preach to the peasant that he is not to be tempted in casting his vote by any consideration of mere money, or fear of "the strong people of this world." The priest should, above all things, combat by the power of his word "the harmful influence which the administration will try to exert over the peasants in its own interest." The publishers of this pamphlet might be called a Priests' Union, their attitude being similar in its mixture of moderation and revolution to that of the Doctors' Union, the Officials' Union, the Railway Union, or the Officers' Union. The title they give themselves is the "Group of Priests." Their organization is, of course, secret, like all the others. Their second and apparently their greatest task is to take advantage of this great historical moment to bring about a renaissance of the spirit of the clergy itself.

"The service of the priests," they say, is humiliated, transformed into a trade. The Church has become the servant of the State, the priest, the serf, and the police."

The priest must profit by the new national assembly to improve and reform the clergy itself. The clergy should not interest itself in its political rôle in the new Duma as a caste or as an organization, but it should do its best to see that the great emancipation is understood by the members of the Duma in its deepest sense. The duty of the Russian priest is to think, to write, to speak, and to do everything possible that the Duma may become the true liberator of Russia; that it may save Russia from its spiritual slavery, and it may

not itself become a new bureaucratic institution. In view of this great task the clergy should redouble its efforts to prevent its relations within the State from becoming an insurmountable obstacle to itself. It should break this bond that ties it to the State at the earliest possible moment.

"We must liberate ourselves," say the Group of Priests, "from the dishonorable tie which has transformed the Russian Church into 'the Department of the Orthodox Confession,' and which has made a sacrilege of religion, putting into the place of Christ a Secretary of the Consistory. Sacred institutions of the Church are transformed by the autocracy into chairs of political propaganda and chairs of inquisition, and the priests have become assistants of the gendarmes and the policemen—lackeys of the rich and strong. The lips of the priest are sealed by the seal of State."

"We must announce the principle," contends the Priests' Union, 'that the Church is independent,' and we must release it immediately. The Church should be independent and free. It is the conscience of the people and of society. It should take into consideration every fact, but always from the point of view of the Christian truth.

The Church can very well condemn one political régime and approve another; it can prefer one régime to another [that is, democracy to autocracy]; but it cannot bind itself with any of the forms of the State, because it is eternal, and these forms are but passing forms."

"There is another prejudice to combat," conclude our Russian priests of the future. "It is the idea that the Church has nothing to do with earthly existence, that the domain of religion is heaven. On the contrary, the Church ought to bring nearer the reign of God on earth; and to bring Russia a step nearer to the reign of truth and good, a change and development of political forms are essential. The clergy is, then, obliged to do everything in its power to guarantee the triumph of that truth and that conception of the general welfare in the Duma—the most concrete expression of the present political transformation."

As a clear, broad-minded, and progressive statement of religious attitude during one of the most intense and deepest of all historical transformations, the declaration of the Group of Russian Priests should call out the most widespread sympathy and confidence among all religious and serious-minded people.

LOVE'S BLINDNESS

BY C. H. CRANDALL

"Poor little Boy," the people said, "he's blind;
He cannot see even to choose his mates.
That girl was thrust on him by evil fates—
She is so plain, of such a common kind.
Yet still to common things he is inclined,
Wearing that smile they carry in such states,—
So pitiful—the blind; neither repines nor hates,
But, if you ask him, says, 'I do not mind.'"

Love smiles!—a smile of pity, kin to tears!

For Love, "blind Love," sees beauty all around,
And in the darkest storm his day is bright;

"Plain" faces grow divine, and all the years
His path is strewn with flowers that hide the ground—
Love's "blindness" so transcends all loveless sight.

THE LIBRARY'S WORK WITH CHILDREN

BY ADELAIDE BOWLES MALTRY

HE whole library movement, as it is known to-day, is practically a development of the last thirty years. The special work with children is of still more recent date; in fact, fourteen years would cover its life, while the last seven years would measure its rapid progress.

Public library workers are fond of calling their libraries the people's universities. The ideal aim of the work is to help educate all citizens. The children's department, then, may be looked upon as the nursery of good citizenship, and the children's librarian must have the spirit of the educator. Our ideal aim is justified by the evident need of at least three elements which an active library can supply. There is universal need for (1) further enrichment of life, (2) greater knowledge, and (3) the establishing of the reading habit. We can acquire the first two elements, further enrichment of life and greater knowledge, through the third, the reading The forming of this chabit is conceded by all to be peculiarly the library's function. I should like to increase the appreciation of the scope of library work in general, of one's own city's library in particular, and to have parents feel that a children's department can be a source of inspiration and practical help with their children; hence this description of a library's facilities for giving such aid.

The first consideration must be the kind of rooms to which the children are invited. It goes almost without saying that they should be large, sunny, and cheerful in coloring. Size we have, and certainly need, to accommodate our fluctuating family, for in all we have in the Buffalo Public Library between thirteen and fourteen thousand members drawing

books, to say nothing of adult visitors, who are always welcome.

Any child who lives in the city, and whose parents are willing to sign the application agreeing to be responsible, may have cards to draw books from the library. It is in seeking the information necessary for filling out these application blanks that we get the most intimate glimpses into the pitifully pinched, distorted lives of some of our clientele. So eager are some of the youngsters for books that they are willing almost to perjure their souls away. What is stronger proof yet of their eagerness-for, alas! many children do not realize the evil of untruth—two boys volunteered to give up smoking cigarettes if they could but have cards, though we had never said smoking was tabooed. while one little girl whose father had signed illegibly her application for cards pleaded, "Lady, papa wrote as well as he could. He's just broken his leg, you know."

But to go back to inanimate things! The furniture in a children's department should all be simple and durable, suited in size to its users. It may be artistic as well, but it must be practical-small chairs and tables for small folk, and so on up to average size, that all may be comfortable. Mrs. Gilman, in her "Concerning Children," criticises some of our home nurseries because we say they are for children, then hang our pictures high, often have perishable furniture, and almost never suit it in size to the wouldbe wee tenants. She clinches her point by asking us to spend our days in chairs from which we cannot touch our feet to the floor, to see how we like it. Another point to bear in mind is that we should have only, or a little less than, what is necessary in the way of furniture.

Given boundary walls far enough apart, plenty of light—preferably sunshine—and necessary furniture, there must be "fixin's." These we offer, first,

^{&#}x27;1 The author of this article was for several years and at the time of its writing Children's Librarian of the Buffalo Public Library, where special attention has been given to this important branch of library work.—The Editors.

in the form of growing plants and cut flowers. A small sum of money is expended every week in the endeavor to keep before the children fresh flowers as their season for blossoming comes round, not only for the æsthetic value, but that knowledge may be gained of the procession of flowers. City children have so little opportunity for the observing of nature.

Second, I would mention pictures and reproductions in plaster of standard works of art. There is little need to add words about the "influence of the old masters upon the minds of the young," "of molding character by association with art reproductions," etc., etc. Too much has already been read and heard. We even tolerate the sentimental but enthusiastic writers of books on picture study, who call them "Guides to the Treasures of the Palace Beautiful;" but we need, do we not, to guard in our enthusiasm against putting before the impressionable minds of our offspring as steady diet pictures too old in theme to admit of at least partial comprehension? Let them be old masters, an' you will, but let there also be in the subject a point of interest common to all child life.

We try to carry out that law of the educationalist, the law of apperception, in our bulletin work. According to general acceptance of the word, a bulletin is a report or notice posted from time to time. Our bulletins are picture compositions posted primarily to attract the children to the department and its books; that they should interest and ultimately lead the children to reading certain books makes their use legitimate. We use pictures in as good prints as we can afford, to illustrate our chosen subject, mount them on cover paper harmonious in coloring, and, with labels for each picture and the whole, with a few suggestive words or a list of books on the subject, we have a bulletin. Whether we post a list with the pictures or not, we always put all books bearing on the subject on shelves next the bulletin-board, and label the case as the bulletin is labeled. In this way, any interest awakened in the children's minds by the pictures and their explanations may

be immediately deepened by the books being at hand. It is gratifying to learn of direct results from this work, for so much of its influence—in fact, of that of the whole department—cannot be measured.

Some time ago a set of clever scissors pictures, stories in artistic silhouettes, were lent to us. These we exhibited under the captions, "Scissors Pictures. Can You Make Them?" It was not long before answers to that question began to pour in. A thirteenyear-old boy modestly asked us to look at the contents of a package one day. To our surprise, he had made, entirely unaided, excellent silhouette pictures. The work was not only neatly done, but the subjects chosen and the composition of the pictures were remarkably good. Bit by bit we learned what proved quite a story. Fred had, a couple of months before, begged his father to have him excused from drawing lessons in school because he disliked the work intensely. This the father had done, after considerable trouble. Seeing our display of scissors pictures seemed to awaken a dormant power within the boy. He obeyed its impulse, tried to copy, succeeded, and from that time on the strongest interest of his days was drawing. We helped with books and suggestions all we could, and watched with gratification his change of heart. He went into all drawing and manual training classes for the rest of the year, took private lessons through the summer in drawing and designing, and entered the art league in the fall for the year's work. Such results do not often come to us, but we do know that through the picture bulletin we lead to definite lines of reading.

The following experience will prove what good illustrating and printing will do toward making books popular. Shelyed separately we have a collection of standard books which are not allowed to circulate. They are the best illustrated editions of popular and good books to serve as bait, so to speak. Among them is a copy of Walter Crane's illustrated edition of the Hawthorne "Wonder-Book." Up to the time this was purchased the children could not be per-

suaded to read the stories in the unillustrated editions, no matter how adroitly or temptingly the invitation was given; even telling part of the story had little effect. Now we cannot have too many copies of any kind of edition.

All our roads lead to books! One charming, quiet byway into their realm is through the telling of stories. Every Saturday morning at eleven during the winter we tell stories to all who care to listen. We announce the story-telling by means of an illuminated poster, placed where all may see. It is needless to say that we have very large circles of eager listeners. In this way we can interest the children in the best literature. for what child does not love a story? and, of course, our selections are from masters in the art. By having the books with us while telling the tale, the connection between story and book is made definite, and the children almost invariably wish the books to take home.

We come now to the personal equation in our methods of attracting. Children are unwittingly the severest critics grown people have. They know almost unerringly the person who will "play fair," and it is to that kind of person they turn with their desires and pleasures. An assistant in the children's department must have a real love for children, patience, enthusiasm, the instincts of a teacher, and, above all, innate refinement—in fact, one might say she ought to have all the graces and virtues. Every bit of knowledge is levied on, as you may surmise when you think of fulfilling such requests as these, which came simultaneously: Child on right side—"Say, teacher, gimme 'High Water,' will ye?" Child on left-"An' I want a book about General Cluster, please;" while still another is pining for "Optical works—stories by Longfellow." Our opportunities for teaching are unique and may require unsystematic means, but our results are far-reaching. have a distinct advantage over the school-teacher, because those children who come to us do so voluntarily. therefore do not have to overcome any prejudice in their minds. They find us friendly and glad to give them what they want. Do they feel that they must read

this or that, or that they are being taught? We hope not, for we believe, with President Eliot, that if you succeed in making a child feel that he is following out a line of study which he has chosen, that he is through his own powers accomplishing something, you have done the best possible educational work. You have awakened the creative spirit and given him the power of independent thinking. Let children choose their own books from among many, but be sure the "many" are first well considered.

The only feature of our work which savors of the school curriculum is the reference work. In that we endeavor to supply collateral reading matter and material on any given composition subject. When subjects are announced, we gather together all useful books and make lists. The library is glad to do all it can in that way, but we cannot promise always to give such wonderful information as this little girl put in her composition on "The Misunderstood Pig:" "The pig is a sweet, clean, docile, intelligent animal."

The library's school department does work with children through the teachers. In co-operation with the Board of Education, principals, and teachers, Miss Rose, the head of this department, makes up libraries for each grade of the public schools. The object is to utilize the teacher's more intimate acquaintance with the child in connection with our knowledge of the books, and thus to insure a thoroughly good use of books. It makes very wise and careful work possible. There is also every year a display of the choicest books suitable for Christmas gifts.

I have given you an idea of our material and human equipment. We need now to consider the books. The motto of the children's room is the trite but pregnant phrase, "The right book, to the right child, at the right time." It is one thing to know books, another to know children, and still quite another to recognize the right "psychological moment" for bringing the two together. Any work is insignificant nowadays if it come not under psychological rulings. Dr. George Vincent aptly says: "The biological figure has of late fallen somewhat into

the background. These are psychological days. There is a psychology of childhood, a psychology of adolescence, a psychology of advertising, a psychology of salesmanship, and there is *Henry James*."

The children's room should be the most important place in the city for the training of readers. We of to-day live in a world of books, and insist that our children shall be early taught to read, that they may the sooner, as Seguin wittily says, "Cover the emptiness of their own minds with the patchwork of others." We have passed the time, however, when reading in itself was considered an unmitigated good. Miss Plummer, Director of Pratt Institute Library School, has described the situation in the best possible phrases when she says, "The ability to read may easily be a curse to the child, for unless he be provided with something fit to read, it is an ability as powerful for evil as for good. When we consider the dime novels, the class of literature known as Sunday-school books, the sensational newspapers, and the tons of printed matter issued by reputable publishers, written by reputable people, good enough in its intention, but utterly lacking in nourishment, and therefore doing a positive harm in occupying the place of better things-when we consider that all these are brought within a child's reach by the ability to read, we cannot help seeing that the librarian, in his capacity as selector of books for the library, has the initial responsibility."

This by no means, however, relieves parents of their responsibility. It would prove of immeasurable profit if they could read all the books their children There are many reasons for so doing, though I will mention only twothe ability thus gained to guard against inferior books, and, best of all, the enlarging of power to understand the child and therefore to strengthen and deepen the confidence of the child in the parent. "But," the cry is, "I have not time." I grant that it may take much time, although one can learn to read rapidly with very little practice. If time so spent is begrudged, why not go to the library for help from the specialists whom the city pays to know just what is needed in choosing books for children? If the plan of knowing what your children read is once tried, I am confident that the new joys thus experienced will be too vital to relinquish. Nor can one begin too early to give the best. A child learns more in the first five years of his life than in any similar period afterwards, and up to twelve years his mind is the most impressionable.

Richard Burton, in his "Literature for Children," puts pertinently what our experience proves. He first makes a plea for giving literary masterpieces to the children, as a whole—not dressed over. What could make that point clearer than this? "A piece of literature is an organism, and should be put before the child, no matter how young, with its head on and standing on both feet." For example, give parts of "Hiawatha" as it is written, rather than the primer, which is poor explanatory prose. Hugh Black tells a story of a little girl who sat listening to a poem that her mother read aloud. In her anxiety lest the child might not understand, the mother stopped frequently to tell in simpler language the gist of what had been read. The little one was quiet for some time, and then said, gently: "Mother, dear, I could understand so much better if you would please not explain." She was getting a meaning from the original that satisfied her; whether it was just what appealed to her mother or not is a different matter. Again quoting from Mr. Burton: "In view of all this preparation of standard writings for the young, there is little excuse for putting up with the second best and the well enough. The choicest is none too good. The dominant division, fiction, for instance, now includes Mrs. Molesworth, Mrs. Ewing, Mrs. Gatty, Mrs. Wiggin, Harris, Page, Stevenson, Kipling, and a score more, these names being set down almost at random. The pabulum furnished us children of a larger growth by Optic, Alger, Mayne Reid, and the Elsie books, has been superseded by more heavenly food. And the older aristocracy of child literature still makes its appeal in books like 'Robinson Crusoe' and Kingsley's 'Water-Babies,' to mention two which

stand for many. Children are most readily attracted by objective literature—the literature of character and action—rather than that which is subjective; fiction of the Walter Scott and Stevenson kind as contrasted with that of George Eliot or Thackeray."

There are certain essentials which must always be considered in selecting a story. First, it must be true; by which is meant true when ideally interpreted. It may also keep in touch with the interest in current events, if that interest is appropriate to childhood. Indeed, if it is not, seize the opportunity to turn the interest to nobler uses. When the town is echoing with excitement over a prizefight, it is idle to suppose that your boy will be deaf to the echoes. Why could you not acquaint him with some of the great characters in mythology, with the real heroes of history, or recite some ballad of "doughty deeds" which will show him what courage really is, and how a true knight uses his strength?

History on the personal, graphic side—treating it as Carlyle conceived it to be, the story of great men—is good for the little ones, and well liked by them. This suggests history given biographically, and presents difficulties, because there are few books of genuine literary merit in either history, biography, or travel; but it is a possibility worth working for. Dickens's "Child's History of England" is a good example of history on the per-

sonal, graphic side. Better biographies for children are being written every year, so one can hope to be assisted increasingly.

In poetry, the epic, the ballad, and the lyric of simple song will prove better than the reflective or purely descriptive piece. I would add that the subject of a poem needs to be within the range of a child's natural interests even more than the subjects in other classes of literature. I am tempted to urge that parents try especially to develop a love for poetry. It is in poetry that man expresses his highest thoughts. Though prose may have the substance of poetry, it can never have the music and charm. Have we ever thought that we may awaken the love of poetry by choosing literary gems for our lullabies and our nursery songs? Many of these have truly musical settings.

To sum up, give first the literature of power to cultivate ideals. Myths and folk-lore do this. The literature of knowledge or science can come later. I have said, choose that which appeals to the child. I do not mean "to base the selection of children's books on their ephemeral interests, but on the fundamental interests of child nature."

Let us, then, teach our children, as Bacon says, to "Read, not to contradict and confute, nor to believe and take for granted, nor to find talk and discourse, but to weigh and consider."

A SHAKESPEAREAN FIND

BY W. J. ROLFE

In the London "Times" for December 29 Mr. Sidney Lee gives an interesting account of a discovery recently made in one of the "household books" (records of domestic expenses) of the Earls of Rutland, preserved at Belvoir Castle. The entry is under the head of "Paymentes for howshold stuff, plate, armour, hammers, anvyles, and reparacions," and reads thus:

1613.

Item, 31 Martii, to Mr. Shakspeare in gold about my Lordes impreso, xliiiis; to

Richard Burbage for paynting and making yt, in gold xliiiis—iiii & viijs.

Mr. Lee remarks that "appeal to contemporary custom and history is needful to the due understanding" of this entry. He adds: "That appeal will show Shakespeare, when retired from the great work of his life, in the act of helping a luxurious leader of Court society to pursue a fashionable craze, which was enlisting at the instant much literary as well as artistic ingenuity. The dramatist's close friend and professional

colleague, Burbage, was his partner in the modish commission, and it has to be borne in mind that Burbage was hardly less renowned as a painter and limner than as an actor. In brief, the recovered document discloses a capricious sign of homage on the part of a wealthy and cultured nobleman to Shakespeare, who, in his last leisured years, complacently turns his powers of invention to playful account in the rich lord's interest, and it adds one to the many links which are already known to have bound together Shakespeare and Burbage, the versatile actor-painter, alike in public and in private life."

An "impreso" (more correctly in Italian, whence it was derived, "impresa"), in the sense here used, was "a hieroglyphical or pictorial design (in miniature) which suggested some markedly characteristic quality or experience of the person for whom it was devised, while three or four words, of slightly epigrammatic flavor, were appended to drive the application home. 'motto' or 'words,' which rarely exceeded four, was commonly a fragment of a quotation from a classical or mod-Almost every language was ern poet. enlisted in the service of Elizabethan 'imprese,' but Italian and Latin were employed most frequently."

Mr. Lee gives the following examples of these devices: "Sir Francis Drake, the circumnavigator, had an 'impresa' which illustrated the spirit of his personal experiences; it showed a ship in full sail riding on a terrestrial globe and tied by golden hawsers to a hand projecting from an overhanging cloud; the motto ran, 'Auxilio divino' (i.e., With Heaven's aid). Rather more pointed was the 'impresa' of a restless malcontent which illustrated his ruling passion; it displayed two greyhounds, one running free and the other chained to a tree; the first was labeled 'In libertate labor' (i.e., In freedom, labor), and the second, 'In servitute, dolor' (i.e., In servitude, grief). Sir Philip Sidney, by way of declaring the unbending nature of his will, employed an 'impresa' showing the tideless Caspian Sea, which, encircled by high rocks, neither ebbs nor flows: the motto was 'Sine refluxu' (i.e., No going back)."

I may add from Fletcher's "Purple Island "the description of another: "A bag fast seal'd; his word, 'Much better sav'd than spill'd.'" Camden, the antiquary, in a chapter on "impreses," distinguishes them from "emblems" thus: "An impresa (as the Italians call it) is a device in picture, with his motto, or word, borne by noble and learned personages, to notifie some particular conceit of their owne; as emblems do propound some general instruction to all." Similarly, Drummond of Hawthornden says: "Though emblems and impresa's sometimes seem like other . . . the words of the emblem are only placed to declare the figures of the emblem; whereas, in an impresa, the figures express and illustrate the one part of the author's intention, and the word the other."

The earliest reference for the word "impresa" that I find in the "New English Dictionary" (Oxford) is from Robert Greene's "Menaphon," 1589: "There was banding [bandying] of such lookes, as everie one imported as much as an impresa;" and the latest given there is from Urquhart's "Rabelais:" "The device or impresa of my Lord Admiral."

The English form, "imprese," occurs once in Shakespeare, "Richard II.," iii. 1.25:

"From my own windows torn my household coat,

Raz'd out my imprese, leaving me no sign, Save men's opinions and my living blood, To show the world I am a gentleman."

Here the quartos have "imprese" or "imprese;" the folios (followed by many modern editions) "impresse." Milton also has the word once in "Paradise Lost," ix. 35:

"emblazon'd shields, Impreses quaint, caparisons and steeds," etc. Lamb uses it, in the sense of motto, in his "Melancholy Tailors:" "The beautiful motto which formed the modest imprese of the shield."

In my copy of Florio's "Worlde of Wordes" (1598 edition) I find the Italian "impresa" defined thus: "An imprese,

a mot, an embleme, a word. Also an enterprise, an action, an undertaking, an attempt." In the modern Italian dictionaries these sets of meanings are transposed, as the latter are now the more common.

The Earl of Rutland, who had lately succeeded to the title, was probably acquainted with Shakespeare. Mr. Lee remarks:

"Intimate friends of the dramatist, and, it may be, the dramatist himself, had long been known at Belvoir. In the first place, the childless elder brother, whom the new Earl had just succeeded in the family honors and estates, was a very close friend of Shakespeare's patron, the Earl of Southampton. Constantly were they seen together at the playhouse in the late Queen's time, when Shakespeare was laying the firm foundations of his fame. The new Earl had shared in some degree his brother's intimacy with Lord Southampton. They had suffered imprisonment together for their complicity in the rebellion of the common hero of their youth, the Earl of Essex. There can be little question that Shakespeare's name was from early days familiar to the new owner of Belvoir.

"An even more notable literary tradition, with which Shakespeare was at any rate indirectly, if he were not directly, concerned, twined itself about Belvoir during the late Earl's reign. The late Earl's barren wife, who followed him to the grave in little more than two months, was daughter and only surviving offspring of Sir Philip Sidney. In her father's spirit she assiduously cultivated the society of men of letters. She bought and read their books and welcomed them to her table. Shakespeare's friend and eulogist, Ben Jonson, composed at her instance a masque for performance at a Belvoir festivity. He was often her guest, and with him and with the poet and dramatist, Francis Beaumont, she regularly corresponded. Both men wrote eloquently of her poetic sensibility. It may well be that documents which are yet to be discovered will set Shakespeare also among the poets who shared the hospitality of Sidney's daughter at Belvoir before he received the new Earl's commission to invent an 'impresa,'"

The "Mr." prefixed to Shakespeare's name in the entry shows that he was regarded as higher in social position than Burbage. Fourteen years earlier (in 1599) his father had obtained the honor of a coat of arms from the College of Heralds, and he and his son thus became "gentlemen."

Burbage had some repute as a painter in his day, and two of the portraits of Shakespeare have been attributed to him, but on very doubtful authority. The only authentic example of his work is in the Dulwich Gallery. That the Earl of Rutland was satisfied with the commission he had given him for the painter's share of the "impresa" is evident from the fact, mentioned by Mr. Lee, that the nobleman employed him again three years later. "On March 25, 1616, the Earl took part in a tilting-match at Court on the anniversary of James I.'s accession. On that occasion, too, his shield was intrusted to Burbage for armorial embellishment, and the actor-artist received for his new labor the enhanced remuneration of £4 18s. There can be small doubt that something far more elaborate than an 'impresa' was then accomplished. Shakespeare was no longer Burbage's associate, for a mournful reason. At the moment that the actor-painter earned this large reward his lifelong associate, of whose greatest creations he was the original interpreter on the stage, lay on what proved to be his death-bed at Stratford-on-Avon."

GOOD NEIGHBORS ALL

BY CHARLES MOREAU HARGER

"Why did you come back?" I asked a Westerner who returned to a prairie town after two years in New York. It seemed incomprehensible that he should leave the excitement of lower Broadway for the monotony of the broad plains.

"Neighbors!" was his response.
"Would you want to spend your life where the people twenty feet away do not know your name or care whether you live or die? We were brought up with neighbors—and when the baby died and not a person in the blessed town came near us, when we went alone to the cemetery, it was too much. We packed up and started for home—what's the use of living that way?"

Does neighborliness exist, like our old geometry problems, in inverse ratio to the square of the distance? Perhaps.

One day last summer, away out in the western Kansas wheat lands, where distances are magnificent and the per capita of population to the square mile is expressed in decimal fractions, a settler became ill. He had fifty acres of fine wheat already turning yellow in the sun. He had no hired man, nor had he the means to engage harvesters. He had counted on "changing work" with some one and thus getting his grain to market. Day after day he tossed in pain and worried over the prospect. Neighbors? The nearest was three miles away, and the whole township had but seven families.

One morning three self-binders with full complement of helpers came rattling over the prairie. The drivers did not ask for permission, but went boldly into the field. Round and round the machines hurried, reaping the ripe grain and leaving shocks of gold dappling the level lands. The sick man heard the buzz of the reapers and tried to get to the window—but his wife told him what was happening, and he fell into a deep, sweet sleep.

It is no slight thing to give up a day in the midst of pressing harvest that a farmer miles away may save his crop, but it is a pretty good sort of sentiment that prompts the action. It may be that it will count for something sometime.

"Would the average city street show an act such as marked a far frontier community in which I spent a night recently?" asked the former New Yorker. then went on: "We had stopped at a little town of less than a dozen houses, and spent the evening listening to pioneer stories in the dingy office of the only hotel. As we were preparing to go to bed, in came three men carrying a violin, a banjo, and a guitar. They were ranchers from the Pawnee Valley, and had been out twenty miles on the plains to enliven the evening for an old friend who was sick and nearly blind, with no one to read to him and no music except that of the ceaseless winds. They did not realize that they had done muchthey simply did what they could without thinking. The leader of the trio started in the West a poor boy. Now he owns 2,500 acres stocked with horses and with registered cattle so good that they take prizes at every royal stock show in Kansas City. Yet he found time to go twenty miles to cheer up an old friend in misfortune. Why shouldn't he prosper?" Why not, indeed?

Some instances have even more of "human interest," as newspaper men express it. One day a woman out on the plains followed to the wind-swept cemetery the husband with whom she had pioneered through long, weary years. She returned to her little home and gathered around her the five children, heartsick and disheartened. She had but one horse: the other had been sold to secure money during the husband's illness. It was time for plowing the corn ground. How could she get another horse? Where could she hire men to do the work? She cried herself to sleep that night.

Early the next morning her eldest daughter awoke her with, "Look, mother, see who's coming!"

Digitized by Google

From the window of the cabin-like farm-house she discerned in the north a number of men who were coming across the prairies with teams, plows, and harrows. To the east were others; so to the south and west. What did it mean? She could not think for a minute. All centered at the farm, and, without stopping to ask her permission, went to work, turning over the chocolate furrows. The harrows followed, then the corn-planters. Thirty teams made short work of the sixty acres, and by noon half the land was ready for the spring rains.

"Now, Mis' Mason," said the leader, big, sturdy Farmer Hansen of the Four Winds ranch, "if you'll give us some water to drink, we'll see if we can get dinner."

She did not need to do more than open her kitchen. The men were used to "baching it" on occasion, and they prepared their food like veterans. They had brought eatables for the meal, and the spread looked very good to the children who hungrily watched them.

"Come on, youngsters," called the leader, cheerily; "have something with us—ye're welcome."

They were welcome indeed. The bounties of a dozen homes had been brought for the occasion and the supply was ample for the children, half famished for a good meal as they were. The afternoon was as busy as the morning, and long before sundown the field was ready for the spring rains. Nor was this all. So plentiful was the provision from the farmers' kitchens that the little home was provided with food for a week to come.

All that summer the neighbors came time after time and cultivated the corn, and when autumn's harvest arrived there was a clean four hundred bushels that had not cost the widow a cent. Pretty good kind of every-day Christianity, that!

Curious, too, how news travels among these communities on the plains. In these modern days the rural mail-carrier makes a close relation between the parts of more thickly settled counties. But take it out on the farther reaches of the prairies, where you are never outside a pasture and where some of the ranches

are thirty miles from the railway, and you have almost wireless telegraphy in the dissemination of news.

"Tom Benton is very sick," is the word that goes out over the short-grass country. It is passed from herder to herder, from soddy to soddy (no one ever says "sod house" in the short-grass country), until it is soon common property for twenty miles around. And then the "boys" make it their business to see that Tom is looked after. One by one they ride over to inquire how he is; two by two they come to "sit up" with him no need of the lodge delegating nurses out here. Nothing too good for Tom when he is sick. And if Tom does not get well-no need to tell how the tenderness of the plains then shows itself. No one ever leaves the West with the feeling that "nobody cared."

The financiers have what they call "community of interests." The West has just that in its every-day life. Sometimes it shows in peculiar and unexpected ways, combined perhaps with an odd mixture of old-fashioned Yankee thrift.

Down on the southern edge of Oklahoma the cotton-planters have a perpetual struggle with the labor problem. In cotton-picking season, owing to the lack of negroes in the county, hundreds of acres of cotton are wasted. But one good Baptist deacon, in the very thick of the contest for the available workers. had an idea. He went to town and saw the superintendent of his Sunday-school. In half an hour he had arranged for the entire membership of the school to give a "cotton-picking benefit" on his farm. for the next two days. Before he left town he had given a two days' benefit to the Methodists, who wanted money for a new church: two days to the Presbyterians, who wanted new furniture; two days to the Catholics, to replenish a mission fund; and closed a deal with the Woman's Christian Temperance Union and the Loyal Legion for three days each, the proceeds to be used to aid the temperance campaign in that county.

The next morning fifty-six members of the Baptist Sunday-school, big and little, old and young, donned pick-sacks, and were early in the field at the farm.

They were paid the prevailing price (seventy-five cents per hundred pounds), and by night had gathered 3,644 pounds. The proceeds went a long way toward buying the needed library for the Sundayschool. Several additions to the school joined the pickers the next day, and close to six thousand pounds were picked. All denominations kept their dates with the cotton-planter, who provided liberal meals and sleeping accommodations for the entire parties. He said that, taking into consideration the feeding and housing of the various denominations, it cost him less than the usual expert negro pickers' work. By the time his contract with the temperance people expired, his cotton was safely housed, while his neighbors were yet scouring the country for help.

A similar experience was that of a central Kansas farmer, who said to the president of the City Library Association, "Why don't you women come out and husk corn, if you want to earn some money to buy books?"

"What will you give us?" was the quick reply.

"Five cents a bushel."

"We'll do it," answered the plucky woman, and the association was called into special session to consider the offer. The corn-field was close to town; the autumn weather was perfect, as autumn usually is on the prairies; the women were eager for a chance to show their husbands their courage and enthusiasm.

On the appointed morning they gathered, a hundred of them, and, with the wagons provided by the farmer, went up and down the long field, snapping off the spikes of maize, throwing them with all the regularity of the every-day farmhand into the boxes. It was severe on weak wrists, and the thin gloves that some of the women wore were soon in shreds. What did the ladies care? a dare, and they would win. Dinner skill you have?" was eaten with a relish that few of them: had known for months, and then the long afternoon's struggle commenced. But only two or three of them gave up, and when sunset came the party went laughing back to the town more than content. They had enjoyed a novel

outing, had absorbed a sufficiency of the open-air ozone, and when the proceeds were invested in new books they felt that they had been amply repaid for the difficulties of carrying out their contract.

Nor are the women of the West less friendly toward their neighbors than are their husbands and brothers. In every batch of country correspondence that comes to the county paper is a report of a "quilting bee" or a "donation party," by which a group of farmers' wives seeks to bring happiness into some household where trouble has entered.

It matters not that telephones and rural routes are many; it is not material that the roads are good and the farmers have good horses; the willingness of the neighbors to help in making the home brighter depends not on these—it was the same when the telephone was unknown, when rural delivery had not been heard of, when the horses were of the common farm-implement variety and could not make a record of more than three miles an hour, and when they were hitched to a farm wagon instead of to a rubber-tired buggy. The spirit of the settlers is the same.

One day there came back into the little prairie community where she had spent her girlhood a woman, bringing her children to her father's house after a bitter experience with a worthless husband. Trouble had set heavily upon her, and it seemed that she was doomed to a loveless and lonely life. In some communities this would have been so. But not with the warm-hearted Western women, the wives of farmers and ranch-They drew no line against herin fact, they went further than mere friendliness.

The wanderer had had in her youth a pretty talent for art in its simpler forms, and one day she was called into a gathering of neighbor women and asked, They were out for a day of work against ... "Why won't you teach us some of the "

"I hardly know how to do it," was the surprised reply.

"The women at the county seat have clubs, why can't we?" asked the wife of a wealthy ranchman.

"They live near each other, and it is easv."

"What difference does that make? Can't we ride and drive?"

They formed an art club—not a very pretentious affair. They have never discussed the great painters of the Renaissance—it is doubtful if they know who they are. They have never pondered grave problems of ethics nor reviewed Henry James's novels.

This they have done: Once a fortnight for three years they have held an afternoon meeting, each member entertaining in turn. Some of the women drive six miles to the meetings, but seldom has there been one absent. Under the guidance of the invited leader they have learned all the fancy methods of artistic needlework and lace-making, competing in good-natured rivalry with one another in their effort to surpass in the beauty of their workmanship. Long ago they found a personal joy in their meetings and a delight in their efforts toward su-

The art club now, with fifty members, has become the center of the community's life; it has brought delight into the township. Last fall I visited a county fair, and in the pavilion was one whole room given up to the work of this club, every member a farmer's wife or daughter—and all the effect of one outpouring of neighborliness. None who saw it failed to praise; but the visitors would have praised more had they understood fully the sentiment that was behind the exhibition of embroidered flowers and decorated lunch-cloths.

premacy in the gentle art of needlework.

Not until the town has grown rich and

arrogant do the clique and the class appear. Before that all are neighbors. In the average Western village this friend-liness exists and the inhabitants do not need an introduction before they speak. They have not yet outgrown the habit of running in "the back way." It is always a sure sign of neighborliness when the back door is used instead of the formality of the hardwood-floored hall.

Of course it is fine to live in a city. The country town, especially if it be "out West," doubtless looks very plebeian to the dweller on pavements and within hearing of a fire station. And doubtless the city has neighborliness, too; but does it reach so high an average (if an average of neighborliness can be computed) as the country town? When things go right, it makes little difference; when they go wrong, neighbors count. flowers that come to the sick-room from friends up and down the street, the dainty dishes and inquiries from across the way, the sympathy and interest, the feeling that you are part of one great family—it all means something in making up the sum of happiness in this very short life of ours.

"I do not know that hearts are kinder or that men and women are more thoughtful West than East," said the returned Westerner, reverting to the subject again. "But, somehow, people are not afraid of showing it out here. Maybe they have less dignity—or maybe they have more. Anyhow, while I live I am going to spend my time in a place where there are good neighbors—I can't live without them."

Mi. Erron Motor

THE STORY OF A NATURALIST'

THEN Herbert Spencer died, he was more than once referred to as "the last of the great Victorians." In the controversial comment which this provoked, the name of Alfred Russel Wallace, who is still living in his eighty-fourth year, was mentioned perhaps more than any other in support of the assertion that at least one "great Victorian " survived Spencer. It is not, however, altogether surprising that Mr. Wallace's claims to distinction should have been overlooked. For many years he has been in virtual retirement, and when he has fared forth it has usually been to support interests which are not such as to add luster to his reputation. Spiritualism, socialism, and land nationalization have found in him an ardent champion, while he has otherwise led Ouixotic crusades against divers prevailing beliefs-against, for example, the belief in the efficacy of vaccination, and the theories obtaining in respect to the organization of the universe. But whatever may be thought of the views he entertains concerning these various subjects, there is no questioning his right to an eminent position in the scientific world. He was not only the first of the Darwinians; he was the co-discoverer with Darwin of the theory on which the fame of both securely rests. While the great evolutionist, after twenty years of patient labor, was finally formulating in England his hypothesis of the origin of species, the same hypothesis took shape in Mr. Wallace's mind as he lay on a bed of sickness in the far-off Malay Archipelago, "I waited anxiously," he recalls in the memoirs which he has at last given to the world, "for the termination of my fit, so that I might at once make notes for a paper on the subject. The same evening I did this pretty fully, and on the two succeeding evenings wrote it out carefully in order to send it to Darwin by the next post." To Darwin the arrival of this letter must have seemed

¹ My Life: A Record of Events and Opinions. By Alfred Russel Wallace. Two Volumes. Dodd, Mead & Co., New York. 56, net. catastrophic. But the noble generosity he displayed and the equally gracious position taken by Mr. Wallace resulted, as scientists are well aware, in the two discoverers receiving full share of the credit due to each.

As may be imagined, the greatest interest attaches to what Mr. Wallace has to say concerning his work as a naturalist, and the famous men with whom this work brought him into more or less intimate relations. As a matter of fact, the remainder of his reminiscences are comparatively uninteresting. In the story of his childhood and of his youthful days as a surveyor there is much of value to the historian of social England. and the reader cannot but be amazed at the marvelous memory which has enabled the veteran to place on paper details which the great mass of mankind would lose in the affairs of after life. But this very multiplicity of detail operates to make the narrative drag, and its continuity is further broken by the inclusion of much in the way of " literary fragments" which might better have been suppressed or reserved for an appendix. However, there is in the nine hundred pages so much that is vital that the one lively regret must be that Mr. Wallace does not lay more stress on his achievements as a scientist and less on the different movements his connection with which has created in the minds of many a false estimate of his place among his contemporaries.

Mr. Wallace himself dates his interest in natural history from the days when he served as assistant to his brother William, who had found employment as a surveyor in Bedfordshire. "It was here," he writes, "that during my solitary rambles I first began to feel the influence of nature, and to wish to know more of the various flowers, shrubs, and trees I daily met with, but of which, for the most part, I did not even know the English names. At that time I hardly realized that there was such a science as systematic botany, that every meanest and most insignificant weed had been accurately described

and classified, and that there was any kind of system or order in the endless variety of plants and animals which I knew existed." But he naïvely admits that, had he not been thrown on his own resources through the inability of his brother to give him steady employment, he would in all probability have become absorbed in surveying, and would have studied nature, if at all, as an amusement for his leisure hours. As it was, at the age of twenty-one he began to busy himself seriously with plant life, and four years later, in company with the entomologist Henry Walter Bates, left England for South America; not, however, to enlarge his knowledge of botany, but to collect birds, insects, and shells in northern Brazil, which was then very much of a terra incognita from the standpoint of a naturalist. The story of this memorable expedition has already been fully told in his "Travels on the Amazon and Rio Negro." Some four years-of jungle work resulted in the securing of , many rare and valuable specimens, and two years more were occupied in London in working out the cell actions. Then came the voyage to the Malay Archipelago, where eight years were spent, and where the crowning triumph was achieved. How the solution of the problem of the origin of species came to Mr. Wallace may best be related in his own words:

At the time in question I was suffering from a sharp attack of intermittent fever, and every day during the cold and succeeding hot fits had to lie down for several hours, during which time I had nothing to do but to think over any subjects then particularly interesting me. One day something brought to my recollection Malthus's "Principles of Population," which I had read about twelve years before. I thought of his clear exposi-tion of the "positive checks to increase" disease, accidents, war, and famine—which keep down the population of savage races to so much lower an average than that of more civilized peoples. It then occurred to me that these causes or their equivalents are continually acting in the case of animals also; and as animals usually breed much more rapidly than does mankind, the destruction every year from these causes must be enormous in order to keep down the numbers of each species, since they evidently do not increase regularly from year to year, as otherwise the world would long ago have been densely crowded with those that breed

most quickly. Vaguely thinking over the enormous and constant destruction which this implied, it occurred to me to ask the question, Why do some die and some live? And the answer was clearly, that, on the whole, the best fitted live. From the effects of disease the most healthy escaped; from enemies, the strongest, the swiftest, or the most cunning; from famine, the best hunters or those with the best digestion; and so on. Then it suddenly flashed upon me that this self-acting process would necessarily improve the race, because in every generation the inferior would inevitably be killed off and the superior would remain—that is, the fittest would survive. Then at once I seemed to see the whole effect of this, that when changes of land and sea, or of climate, or of food supply, or of enemies, occurred—and we know that such changes have always been taking place—and considering the amount of individual variation that my experience as a collector had shown me to exist, then it followed that all the changes necessary for the adaptation of the species to the changing conditions would be brought about; and as great changes in the environment are always slow, there would be ample time for the change to be effected by the survival of the best fitted in every generation. In this way every part of the animal's organization could be modified exactly as required, and in the very process of this modification the unmodified would die out, and thus the definite characters and the clear isolation of each new species would be explained. The more I thought over it the more I became convinced that I had at length found the long-sought-for law of nature that solved the problem of the origin of species.

This was in 1858. Four years afterwards Mr. Wallace returned to London to find scientific England, already acquainted with his discovery and in a ferment over the publication of Darwin's great work, awaiting his arrival with no little curiosity. He was now assured of the friendship of many eminent men; but he was equally certain to be drawn into the whirlpool of controversy. Of the battles of the evolutionists and anti-evolutionists he says comparatively little; but he allows us numerous and intimate glimpses of his illustrious fellow-workers-Darwin, Huxley, Spencer, Lyell, Tyndall, Romanes, Mivart, and others. Curiously enough, he accords primacy among these to the geologist, Lyell, "not only on account of his great abilities and his position as one of the brightest ornaments of the nineteenth century, but because I saw more of him

than of any other man at all approaching him as a thinker and leader in the world of science." Cautious and conservative by temperament, but of a liberal and genial mind, and with a lively sense of humor, Sir Charles must have been a most companionable friend as well as an invaluable counselor. With Darwin, too, Mr. Wallace was on terms of the warmest friendship, and although they differed roundly concerning the mental and moral nature of man, their personal relations do not seem to have been disturbed. The correspondence here published, some for the first time, reveals, as "The Life and Letters of Charles Darwin" and "More Letters of Charles Darwin" have already revealed, the intense humanity of this devotee of science. The human side of Spencer is likewise clearly shown. To cite but one anecdote, Mr. Wallace refers, in passing, to Spencer's life at Bayswater, "where he lived for many years in a boarding-house with rather a commonplace set of peopleretired Indian officers and others." There they frequently dined together, and, the naturalist continues:

I was amused when some popular error was solemnly put forth at dinner as the explanation of some phenomenon, and Spencer would coolly tell them that it was quite incorrect, and then proceed to explain why it was so, and on principles of evolution could not be otherwise. In the evening, after we had had a little private conversation, we would go into the drawing-room, where there was music, and Spencer would sometimes play on his flute. On remarking to him one day that I wondered he could live among such unintellectual people, he said that he had purposely chosen such a home in order to avoid the mental excitement of too much interesting conversation; that he suffered greatly from insomnia, and that he found that when his evenings were spent in commonplace conversation, hearing the news of

the day or taking part in a little music, he had a better chance of sleeping.

Huxley, another of the friends of his London years, always inspired in him, he confesses, a feeling of inferiority and awe—"an inferiority which I did not feel either with Darwin or Sir Charles Lyell." This feeling Mr. Wallace ascribes to the fact that Huxley's enormous fund of knowledge was of a kind of which he himself possessed only "an irreducible minimum." Huxley, it might be added, was one of the several leaders of thought whom he vainly sought to enlist in his inquiries into spiritualism, his efforts only evoking the following characteristic letter:

I am neither shocked nor disposed to issue a Commission of Lunacy against you. It may be all true, for anything I know to the contrary, but really I cannot get up any interest in the subject. I never cared for gossip in my life, and disembodied gossip, such as these worthy ghosts supply their friends with, is not more interesting to me than any other. As for investigating the matter—I have half a dozen investigations of infinitely greater interest to me, to which any spare time I may have will be devoted. I give it up for the same reason I abstain from chess—it's too amusing to be fair work, and too hard work to be amusing.

This letter from Huxley is in itself one explanation of Mr. Wallace's failures to induce his fellow-scientists to explore the "borderland." The narrative of his own explorations finds place, of course, in these pages, and is written with the frankness which is one of the most pleasing features of the work. But it fades in interest, as does all else of which he treats, when compared with his account of his labors as a naturalist, and of those wonderful days when, with Darwin and his friends, he strove to compel acceptance of the doctrines of evolution,

Comment on Current Books

Sound judgment must The Bible and agree with Dr. A. T. Spiritual Criticism Pierson in his definition of "Spiritual Criticism" as involving the recognition of a spiritual, supernatural element in the Bible, and the need of a spiritual mind to apprehend it. But, as a spiritual mind should keep its common sense, sane judgment must break with Dr. Pierson's method of applying his definition. When one reads in Deuteronomy (xxiv. 16) that children shall not be put to death for the fathers, and in the book following (Joshua vii. 24, 25) that the children of Achan were put to death with him for his theft, the contradiction and the later date of the humane precept are each indisputable. But Dr. Pierson's "spiritual criticism" so sticks to the letter of the story that it forbids questioning the reality of the alleged divine mandate, "Thus saith the Lord," which doomed those hapless children. He accepts both their slaughter and the prohibition of it as alike divinely authorized. What, then, of the "spiritual symmetry" which he finds between the mathematical plan of the universe and the symbolic numbers of the Bible, as identifying the Creator with the "Author of the Book"? Under the blinding influence of a false theory of inspiration this book presents a strange jumble of gold, silver, and precious stones with wood, hay, and stubble. (The Baker & Taylor Company, New York. \$1, net.)

We judge from internal evi-A Book of dence that the author, F. A. Steel, is the Mrs. Steel whose stories of India are highly esteemed. The title, somewhat singular in itself, is much more so when it is found to apply to a book about animals, with the intent of showing what virtues, vices, and traits they share in common with man. Mortality is unquestionably one of those traits, and thereby the title is justified. Mrs. Steel treats her subject under such heads as "Gluttony and Temperance," "Marriage," "Fortitude and Envy," "What Animals Have Done for Man," and adds some special chapters dealing with such animals of myth or parable as Ulysses's dog, Balaam's ass, and the Phœnix. There are both humor and kindliness in the writing of this book. The form is a small quarto and there are many suitable pictures. The dedication in verse is to "a puppy called Angelo." (The Macmillan Company, New York. \$3.) 374

The thirteen years (1789-The Federalist 1801) studied by Professor System J. S. Bassett in this addition to the "American Nation" serial history cover a crucial period in the historical evolution of the United States. On the one hand, those to whom its destinies were intrusted found themselves confronted with the task of erecting a stable and enduring governmental structure under a Constitution variously interpreted by different sections of the country; and, on the other, their ingenuity and patience were taxed to the utmost to prevent the Nation, not yet recovered from the effects of the Revolution, being drawn into another war by the harassing diplomacy of England and France. Internally, too, the period was one of restlessness, and marked by the rise and decline of the Federalist party, the organization of the Republican party, economic growth, and a forward movement in the direction of territorial expansion. All of these facts must be grasped and clearly propounded by the historian, whose task is rendered none the easier by the virulence of the party politics of the time. Professor Bassett, we are glad to find, has acquitted himself with credit. From the literary standpoint his work does not reach any high level; nor is it marked by the originality which gave such distinction to the earlier volumes by, e.g., Professors Bourne and Andrews. But the opportunity for originality was not the same, so thoroughly has this particular period been studied by previous writers, and on the score of accuracy, lucidity, impartiality, perspective, and perception of cause and effect, little fault is to be found. Of especial value is the exposition of Federalist diplomacy and of the development of the Republican party, while the chapters on economic and social conditions are to be commended for the facility with which compactness and comprehensiveness have been united. Generally speaking, the great statesmen of these years of formation are dealt with justly, although none are portrayed with sufficient vividness. We observe, tool an imperfect apprehension of the significance of the events occurring along the Western frontier. Indeed, the treatment of Western questions generally is perhaps the least satisfactory feature of a book which we have perused with pleasure. As is customary in this series, it is equipped with an excellent index and critical bibliography. (Harper & Brothers, New York. \$2, net.)

This fresh volume of essays The Eternal by an English writer who Religion during the last five years has won a large circle of American readers (the "J. B." well known in England by his initials in the "Christian World") has a somewhat more obvious unity and aim than its predecessors. Its literary charm and its ample use of the world's thought and experience insure it a wider interest than its title may seem to invite. In effect it is a cogent vindication of the need of a new theology even more comprehensive and persuasive than that which is so called, because more insistent on the ethical demands of genuine Christianity. Mr. Brierley pleads for "a reinforcement and reconstruction of the Christian idea." Dean Stanley's remark long ago, "What is good science is good theology," is repeated with fresh emphasis to a generation more disposed to believe it: "There is no true revelation that is not science, and there is no true science that is not revelation." These two are simply two aspects of the one reality. Eternal religion is the correlate of an eternal, ever-developing revelation. "Under a never-ceasing guidance and uplift man has slowly clarified his view of God, of his brother, of duty, of sacrifice, of life and death.... That the New Testament is a different book to us from what it was to our fathers is a proof in itself that the revelation continues." In Mr. Brierley's treatment of his subject breadth and discrimination are equally apparent. With nice appreciation of essential sameness or difference, he is intent on the spirit within the form, the reality behind the symbol. Each essay is brief, but prolific in suggestion. Matter for many volumes is compressed here into one. For all religious teachers, and for any who are perplexed with religious problems, it would not be easy to find a more stimulating and helpful book. (Thomas Whittaker, New York. \$1.40.)

This acceptably printed In Memoriam edition of Tennyson's great poem has as its special plaim of interest the fact that for the first time are here published Tennyson's own notes on the poem. addition, there is an introduction to the notes by the present Lord Tennyson, who also acts as general editor. Included in the introduction are interesting comments on the poem from Gladstone and other critics and thinkers of note, together with some illuminating information about Tennyson's religious philosophy. The notes themselves are not always of importance, but frequently they do throw light on the meaning and association of particular lines. (The Macmillan Company, New York. \$1.)

These "essays written in time In Peril of of tranquillity" regard the Change present as a time of unstable equilibrium, and estimate the forces which are working to bring in a new order of things. The approach of this forms the subject of the concluding chapter and gives title to the book. The author, Mr. C. F. G. Masterman, a university man and an accomplished journalist, writes with an incisive pen. The growing discontent with political parties, churches, and existing conditions generally, which characterizes our time, imparts a somber tone and a foreboding note to his estimate of them. Though written for Englishmen, it is largely applicable to us. Here also are the Bourbons, the "stand-patters" of privileged interests, insisting on "the permanence of summer days," and churches which have lost the respect of "workingmen" by failure to emphasize the social message of the Gospel. Here also the all but accomplished capture of our financial metropolis by socialistic interests under the banner of municipal ownership is a close second to the victory that has just ditched British "Conservatives" and carried nearly fifty "Laborites" into Parliament. Profitable reading for us are Mr. Masterman's observations of the ground-swell that presages a change of weather. The first half of it, in essays of high excellence, literary and critical, reviews the lives and the ideals of notable men of the later Victorian period. A second series of essays interprets the phenomena of the present period, literary, religious, sociological, as portending that existing conditions cannot long endure. Though the tone is somber, the expectation is hopeful; the change, whatever its perils, is to be for the better. (B. W. Huebsch, New York. **\$**1.50.)

No. 101 A story of mystery and intrigue in the days of Louis the Fifteenth, by Wymond Carey. No. 101 is a wonderful spy, unknown alike to those he (or she, perhaps) spies on and those he serves. Many persons are anxious to discover the identity of this mysterious person and terminate his activity, among them Madame Pompadour. Their efforts produce complications, conspiracies, and conflicts. The story is entertaining and—but, after all, that is all that such a story needs to be. (G. P. Putnam's Sons, New York. \$1.20.)

Mr. Scraggs This collection of tales by Henry Wallace Phillips is after the order of his "Red Saunders" stories, which have had a wide popularity. The tales are uproariously humorous, and the narrator finds a congenial subject in the

extravagance and oddities of the Far Western country, in which cowboys and miners disport themselves after the reckless and amusing fashion of pioneer days. There is no pretense to any exact picturing of real life; the whole thing is burlesque; but it cannot be denied that the travesty is lively and entertaining in a high degree. (Grafton Press, New York. \$1.)

Henryk Sienkiewicz's new On the Field Polish romance, his only work of Glory in fiction within the last five years, has the same qualities that made "With Fire and Sword" and the other books in his famous historical trilogy so vivid and powerful. Here, as there, he overcomes the English reader's natural reluctance to conquer the rough nomenclature of people and places, to feel an interest in the confused and turbulent war-history of early days, and to forgive some unpleasant realism in the depiction of the coarseness and cruelty of the period treated—in this case, that of the famous Sobieski, who at the time of the story is drawing his forces together to oppose the Turks at the second siege of Vienna. A love story of passion and intensity, fighting of the most thrilling kind, dramatic episodes of Polish personal feuds, and graphic pictures of Polish country life-all are brilliantly presented, while the element of humor is supplied by a band of four brothers named after the Evangelists, who are mighty of hand, thick of skull, and warm of heart. Mr. Jeremiah Curtin has translated the book with his usual faithfulness and sympathy with the author's genius. (Little, Brown & Co., Boston. \$1.50.)

Beside his volume of "One Pulpit Power Hundred Best Sermons of and Eloquence the Nineteenth Century" Mr. Frederick M. Barton here puts another-"One Hundred Revival Sermons and Outlines." In it all periods of the Church but the "dark ages" are represented, from Justin Martyr to W. J. Dawson. The selections have been made with aid of suggestions from many advisers. The favorites of these appear to be Spurgeon and Moody, who contribute eleven discourses each. Beecher, Brooks, and Bushnell are drawn upon each for one. From the late Dr. Henry J. van Dyke, father of our genial contemporary, is taken one on "Why Christians Believe in Everlasting Punishment," and from John Leland one on "The General Conflagration" now approaching to destroy the world. Such selections are plain anachronisms, valuable only in a historical estimate. Many others are serviceable to-day. (F. M. Barton, Cleveland, Ohio.)

President Sharpless, of Quakerism and Haverford College, has **Politics** brought together in a neat little volume a number of papers and addresses of peculiar interest at the present moment. They deal in the main with the political conditions of Pennsylvania, past and present, and with the part played by members of the Society of Friends in the politics of that State. Written from the Quaker point of view, they are valuable to non-Quakers as an exposition of the principles underlying Quaker conduct, and to Quakers as a stimulus to definite action in the direction of insuring political reforms. President Sharpless's position, briefly, is that it is unjust to attribute, as has been done by some, the evil political condition of Pennsylvania to the non-militant habits impressed upon it by its Quaker founders; but that it is true that the Quakers of Pennsylvania have, as a general thing, held themselves too much aloof from political activity. "Friends," he warns his Quaker readers, "can never more be that exclusive body which they have been in the past, shutting themselves off from activities which involve temptation, and confining their exertions to charitable and philanthropic work and to other efforts which do not touch adversely their convictions. . . . And a decay of character will come, not as the result of taking up new fields of activity, but as the result of shirking any field of activity in which it is right for us to enter because of dangers and difficulties in the way." Some of the papers (e.g., "The Welsh Settlers of Haverford" and "How the Friends Freed their Slaves") are particularly helpful to

Somerset House, now uti-Somerset House lized by the British Government as a departmental building, has had many romantic associations since it was first built by the Lord Protector from whom it takes its name, and in recounting its history Mr. Raymond Needham and Mr. Alexander Webster have performed a task which will doubtless afford pleasure to a number of readers. The pleasure would have been increased, however, had the authors displayed less antiquarian and architectural zeal and more interest in the human element in the story of the famous palace. Under the Tudors, and still more under the Stuarts, it was a royal residence where centered much social and political activity; and even in the eighteenth century, when it was degenerating into a "humdrum, lodging-pen existence," there occurred within its walls not a little far from "humdrum." Here Elizabeth fre-

the social historian, and all are instructive.

(Ferris & Leach, Philadelphia.)

quently met her council, Henrietta Maria intrigued for the revival of Catholicism, Oliver Cromwell was laid in state, and visiting royalty and ambassadors were entertained. The two authors have, to be sure, devoted a good deal of space to the historical occurrences, but they relate them in a manner devoid of enthusiasm, and with scant effort to make clear their significance. On the other hand, no fault is to be found with the presentation of the evolution of Somerset House itself, its architectural features, its artistic treasures, the changes effected in succeeding generations, etc. Here the writers are full and precise, and the student will find within their pages much to which access is difficult elsewhere. (E. P. Dutton & Co., New York. \$3.50, net.)

The Testimony of St. Paul to Christ

to St. Paul, especially of all the more important ones. Documentary evidence is thus secured

ones. Documentary evidence is thus secured for the main facts of the Evangelic Tradition embodied in the later-written Gospels from a date no further from those facts than we are from Mr. Cleveland's first inaugura-

tion in the Presidency. The Boyle Lectures for 1903, 1904, and 1905, by Dr. R. J. Knowling, Professor in the University of Durham, England, are occupied with a critical review of the discussions which have established this fundamental position, and exhibit the varied significance of its testimony to Christ. The first series takes up the Pauline documents one by one, and undertakes to establish the genuineness of the few that are still in controversy. The second series critically examines the testimony of the letters to the facts and teaching of the Gospels. The third series reviews their testimony in relation to the life of the Church. Taken together, these twenty-four lectures present a masterly review of contemporary critical work in this important field, together with an appraisal of its results. To the discussion of the theories of radical critics, such as van Manen and Schmiedel, which frequently recurs, is added a special lecture on the critical literature of the latest date in Germany, France, and the United States. As a summary and an appreciation of the present fruits of scholarly work on a fourth part of the New Testament such a work is of uncommon value. (Charles Scribner's Sons, New York. \$3,

Letters to The Outlook

THE SITUATION IN PHILADELPHIA

Referring to your article under the above caption in a recent number of The Outlook, I beg to make some corrections. For the errors in your review The Outlook is not at fault, for two newspapers, one of which has done good work for the reform cause, have published false statements of late, and with such emphasis that a few even of the "elect" have been deceived thereby.

The facts are these:

The Lincoln party, the State reform party, which met with signal success in the November election, is working in perfect harmony with the "City party," which confines its work exclusively to city affairs. The Lincoln party has not " made a fight to secure control of the Republican machine," and will make no such effort in the election to be held February 20. Many times the two Philadelphia newspapers above referred to have declared, the one maliciously, the other having been deceived, that John M. Mack is guiding the Lincolnites into the Republican ranks. There is not a word of truth in this statement. Mack is as thoroughly "down and out" as are his "former political and business partners, Durham and McNichol."

The City party has no use whatever for the Republican machine at present. They are now the dominant party by a handsome majority—more than 35,000 in this city—and present indications seem to assure a still larger preponderance in the coming important election.

The only ground for the temporary misleading of our good people along the lines of your last report of our situation was in the fact that one city newspaper aspired to the distinction of capturing the Republican machine for the Independents in conjunction with a most earnest and active reformer, a leader of the last campaign, and a few former office-holders newly converted to the reform cause, and of launching their scheme upon the public. It was promptly and emphatically repudiated. The scheme is scotched, and now perfect harmony reigns among the hosts of reformers.

Philadelphia. Francis B. Reeves.

WAS THOMAS A SKEPTIC?

In your editorial of December 16 the writer saw but one occasion for criticism, and that only as to the letter, but not as to the evidently intended meaning, in "Conversion did not change him." But the critics of

January 6 present most exaggerated examples of drawing upon one's imagination for facts. We are told that Thomas was not more skeptical than Peter, who thought the stories of the women idle tales. The record is, "seemed to them," etc. If, after a second thought, Peter held the same opinion, why the next sentence, as in the New Version, "But Peter arose and ran," or, as in the Old, "Then arose," etc. Where is Thomas? For he had at this time the same evidence as Peter (Luke xxiv. 9). Each acted in accord with his peculiar temperament. But why try to exonerate Thomas by slandering Peter? True, some doubted, but who shall say that "them" in Luke xxiv. 11, and "His disciples" in Mark xiv. 7, were not the same? Here the words were "His disciples and Peter." These doubted the women, who might have been mistaken, when frightened and overcome with grief, as others failed to recognize him when walking toward Emmaus; but Thomas doubted not only the women, but the other ten, nor would he even investigate. Your critic refers to Thomas as a "sensible, sane, serious-minded man." Mark says, "He . . . upbraided them for their unbelief," etc. Luke quotes, "O fools, and slow of heart," and John, "Blessed are they that have not seen and yet have believed." Was Thomas, then, in this respect the ideal of Jesus?

The next critic dates the church organization at or after the day of Pentecost, and thinks it unfair to look for Christian discipleship or doctrine previous. Yet Jesus had ordained the Apostles, given them authority to remit sins, and sent them to the world, ordering them to wait for a further baptism of the Holy Ghost. Was there no organization of these one hundred and twenty, waiting in prayer? If not, then to what were the three thousand added (Acts ii. 4)? If our theologians manufacture no dogma beyond that of the pentecostal sermon, they will neither be wise beyond nor contrary to what is written. The writer admits being skeptical enough to think it possible, and fair, to go back of the Pentecost to discover much of the meaning of both Christian discipleship and doctrine, even to the words of the Great Teacher, and that the work of this second day of the Feast of the Passover was but supplemental to the constant teaching and familiar with John xx. 29, or consider themselves exponents of more advanced thought, may be left for their consideration; evidently the Creator intended some to be conservative, like Thomas, and some impulsively radical, like Peter, and who shall say that the latter is less sane, useful, or blessed?—one the propelling power, and the other the brakes upon the car of progress.

A READER.

COMMENTS ON COMMENTS

Two comments in The Outlook fill me with wonder. One is on "Musicians and Labor Unions" and the other "The Doom of Political Autocracy." In the first you speak of "musicians lowering their calling and injuring their economic standing by regarding themselves as laborers." Is it, then, degrading to labor? As I understand the purpose of labor unions, it is to protect their members from the tyranny of capital. Their purpose is purely economic. In what way do musicians lose their economic standing in joining the one organization that has made an attempt to raise the economic standing of all labor, and has pretty well succeeded in doing it? As for lowering their calling, do you infer that their calling is higher than that of other laborers? Assuming that it is, instead of lowering their own, are they not rather raising the standard of the labor organization by joining it? Are not the wrongs of all employees of capital the same? Perhaps I should say the economic wrongs.

Personally, I have suffered from the tyranny of labor unions, as have all people who have ever had business dealings with them. On the other hand, we suffer from the oppression of capital, and our personal sympathy must be set aside and the situation regarded as the results of causes. Musicians have ioined the labor unions because they have been driven to it by the same need of protection against capital that created the first labor organization. It is not the purpose of the union to "determine in what fashion a work of music should be performed," but to insist upon moderate hours of work and living wages for its members employed. Orchestral players, chorus singers, and all other musical performers have the same need of these that other laborers have. Joining a labor organization has evidently been their only means of getting them.

of the meaning of both Christian discipleship and doctrine, even to the words of the Great Teacher, and that the work of this second day of the Feast of the Passover was but supplemental to the constant teaching and example of the Master for the three years previous. Whether your critics are not familiar with John xx. 29, or consider themselves exponents of more advanced thought, may be left for their consideration; evidently the Creator intended some to be conservative, like Thomas, and some impulsively radical, like Peter, and who shall say that

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

Copyright, 1906, by the Outlook Company. Entered as second-class matter in the New York Post-Office.

A kiss, a hug, and baby slips off his mother's lap into a bowl of clean, warm water.

There he finds two wonderful things

—a Sponge and a cake of Ivory Soap.

Mother squeezes the sponge and water runs all over baby's arms, his body, his legs and his little pink toes.

Then she takes the soap, does something with it—and baby is covered with a soft, creamy substance that takes all

the dirt away and makes his skin as smooth as satin.

Baby squirms and splutters and splashes. But he enjoys it. So does his mother. So does everybody else.

There is nothing in all this world that is cleaner and sweeter than a clean baby; and there is no better way to keep a baby clean than by the regular use of Ivory Soap.

For nearly thirty years Ivory Soap has been used for bath, toilet and fine laundry purposes. Millions of men and women who are now fathers and mothers themselves were "brought up on it." Because of its exceptional purity, it is the only soap that should be allowed to come in contact with the delicate skin of a child.

Ivory Soap-99 41/100 Per Cent. Pure.

The Ship Subsidy Bill The bill granting subventions to some owners of some ships

passed the Senate by a vote of 38 to 27. Five Republicans, including both of the Senators from Wisconsin, joined with the Democrats in opposition, and the fact that so stanch a Republican and protectionist as Senator Spooner was among the number is significant. There was no debate worthy of the name, and the opinion is widely and confidently expressed that the House will not pass this bill or one substantially like it. is true that the bill, so far as possible, disguises subsidy as mail subvention: but the distinction is clear in principle between paying for mail-carrying because the service rendered is worth having at the rate paid, for the good of international postal work, and paying large sums in order to encourage shipbuilding and support the business of ship-owners. As it passed the Senate the bill establishes thirteen new contract mail lines, and increases the subvention to the oceanic line running from the Pacific coast to Australasia. The new lines include three to the Far East and ten to Mexico, Central and South America; three of the lines would leave Atlantic ports, four Pacific ports, and six ports of the Gulf of Mexico. All ships receiving subvention are to be of over 1,000 tons, and the aggregate compensation would be at first about \$3,000,000 yearly, and would grow larger; but increased tonnage rates would, it is claimed, offset this to some extent. A subvention is granted at the rate of \$5 per gross ton per year to cargo vessels engaged in the foreign trade of the United States, and at the rate of \$6.50 per ton to vessels engaged in the Philippine trade, the Philippine coastwise law being postponed until 1909. The Outlook has repeatedly recorded its belief that the

theory that the whole people may be taxed to provide bounties for a comparative few carrying on one particular business is totally vicious in principle, and here reasserts the belief and applies it to the measure now in question.

❸

Railway Rate la

The principal feature of last week's discussion in Congress on the subject

of railway rate regulation was Senator Lodge's speech. He divided the grievances against the railways into (1) rebates, or discrimination between persons; (2) excessive rates; (3) discrimination between localities. As Mr. Lodge says, the present law has undoubtedly largely checked railway rebates, but it has not entirely stopped them. To make the law thoroughly efficient, he would add three provisions. The former penalties, now repealed, of the Inter-State Commerce Law should be restored, and secret evasions of the published rates should be made punishable by imprisonment; for those who evade the law suffer little by a fine, even if it be heavy, as their financial resources are large; they would, however, feel acutely a punishment by imprisonment. Next, there should be a provision to facilitate the procuring of evidence by the Government's law officers, and, finally, the enactment of provisions in regard to private car lines, switching charges, midnight rates, etc. As to the second grievance—that of excessive rates—the experience of other countries shows, he said, that whatever good effects Government rate-making has had, it has not lowered rates; on the contrary, it has made them not only higher, but inelastic. The remedy for the third grievance—that of discrimination between localities—ought not, in Mr. Lodge's opinion, to go beyond the fixing of a

Digitized by Google

maximum rate by the Commission, with "the most absolute protection against hasty or prejudiced action through provision for an appeal to the courts." We would add that the pending Hepburn bill expressly admits the power of the carrier to appeal against the Commission's orders, in case the rate is claimed to be confiscatory, but, in the opinion of those conservatively inclined, the language is not sufficiently explicit and far-reaching in defining the courts' power, certainly not as much so as was that of the Esch-Townsend bill passed a year ago. Mr. Lodge said:

I am not yet prepared to substitute for the courts of the United States an executive commission. . . . Legislation cannot prevent an appeal to the courts if it is alleged that the rate is confiscatory; but this is a very narrow ground and a very limited right. A rate may not be absolutely confiscatory, and yet may be in the highest degree unjust and unreasonable, and, indeed, well-nigh ruinous. I am not sure that it would be possible to deprive a citizen by legislation of the right to appeal to the courts as to the justice and reasonableness of a given rate, which is a purely judicial question.

In sympathy with the above, the Senate Committee on Inter-State Commerce has been considering an amendment providing that a carrier may question in the courts the Commission's decisions as to a maximum rate, together with all the testimony on which that decision was reached. The Committee has also voted favorably on two amendments, the first enlarging the membership of the Inter-State Commerce Commission to nine members, fixing their tenure of office at nine years and their salaries at \$10,000, as in the original draft of the Hepburn bill; the second fixing the liabilities of railways on bills of lading in cases of negligence. A possibly equally important event of the week was the introduction by Senator Elkins of a new railway rate regulation bill, the most significant section of which provides that, if the Inter-State Commerce Commission exceeds its powers, or does an unlawful act, the carrier affected may apply to the United States Circuit Court for a restraining order, and the Court may, in its discretion, suspend all or part of the Commission's findings, pending the final determination of the case, the carrier

giving bond covering the sum for which it might become liable in the final decree. It is always easier for the carrier to give a bond covering the time of appeal than for the shipper to pay the excessive rate until the difference is awarded to him by the court of appeal.

(2)

Senator Lodge, in com-Railway Rates paring railway rates in in Germany this country and in Europe, referred to the rates established in Germany by the Government, which operates almost all the roads, as complicated and inelastic, abounding in discriminations (not in the way of rebates or to individuals, but founded on localities and the nature of the articles and industries), with the result, he said, that rates are fifty per cent. higher than our own. This disagrees with the statement about German railways contained in an article by Mr. Russell, lately summarized in The Outlook. The actual facts are stated, presumably with accuracy, in a report by commissioners recently sent by the Prussian Government to the United States to study American railway systems. Their statement shows that such contradictory assertions as we have just referred to arise from not taking into account all the facts concerned. The German commissioners find that the average passenger rate in Prussia (which may be taken as fairly representative of German railway systems) is 0.98 cents as compared with 2.02 cents in America, while it would appear at first sight that the freight rates average 0.78 cents per ton per mile in the United States against 1.36 in Prussia. That conclusion is fallacious because the American figures include freight carried for the railways themselves for which no charge is made, while the Prussian statistics include only freight actually paid for. It is also true that the apparently lower American rate is affected by the fact that it does not include the express companies' business, nor the large sums received by the American lines for carrying the mails, nor does it take account of the fact that the Prussian lines carry an immense amount of postal-package matter for the

Government which owns them, while the American roads carry similar matter for the express companies and receive large pay for it. The commissioners. taking into account these important statistics, conclude that a proper figure for the American average freight rate would really be 1.44 cents per ton per mile, while that for the Prussian railways would be 0.95. This explanation is not only valuable as throwing light on relative rates where the Government has a voice in the fixing of rates and where it has not but also as an illustration of the ease with which false deductions may be drawn from figures perfectly correct but not complete.

The American consular service Consular has never been either a properly paying or a permanent serv-Special attention was called to the ice. first of these faults last week by the resignation of Mr. Davidson, our Consul at Antung, Manchuria, on the ground that he is no longer able to eke out his consular salary by his private income. Mr. Davidson has been an efficient consular officer, serving with distinction at Shanghai and Nanking before being transferred to Antung. His knowledge of the special conditions now prevailing in China is, of course, hardly to be possessed by any man who has not had Mr. Davidson's nine years of service. Davidson's special training and equipment would be peculiarly valuable at this time, not only because we must use such a consular officer for our instruction in avoiding further difficulties with the Chinese, but also because in Mr. Davidson we have an exemplar of the now historic Hay policy, which may have alone preserved China from being partitioned among the Powers, and also made possible the growth of a normal, self-respecting Government there. cause our consular service cannot offer living salaries, in many positions, therefore, there can be no continuity of policy, save as a raw recruit can apprehend it. Why is not the consular service properly paid and why is it not permanent? Because it is not based upon the intelligent and careful choice of men which would distinguish a commercial house in sending agents abroad. But a commercial house is not influenced by political considerations. should our Government be. Members of Congress are at last paying some heed to the persistent appeals for consular reform, for some of the provisions of the bill supported by Secretary Root have been passed by the Senate. We earnestly trust that the House will not only confirm this action but improve on it. influence in that direction is the call just issued for a consular convention to be held March 13 and 14 in Washington. Among the influential organizations supporting the call are, the Board of Trade and Transportation, the Manufacturers' Association, and the Produce Exchange of New York City; the Chamber of Commerce and the Merchants' Association of Boston, the Board of Trade and the Trades League of Philadelphia, the Board of Trade of Chicago, and the Chambers of Commerce of Baltimore. Buffalo, Cleveland, and San Francisco.

@

When the investigation of The Guilty fraud and bribery in the Punished Post-Office Department began, there were not wanting those who professed to doubt its sincerity and thoroughness, while a larger number scoffed at the idea that actual punishment would be meted out to those accused men who had been highest in office and strongest in political and departmental influence. But last week George W. Beavers followed August W. Machen into imprisonment. These two men, if not more guilty than others, were at the head of the conspiracy, and were most to be condemned because they were most trusted by the Government and were most deeply involved in a breach of confidence. From the beginning of the prosecution it has been clear that the Administration would be satisfied with nothing less than the substantial punishment of these criminals, and both, after trying every turn of evasion and the law's delay, have been driven to a plea of guilty and the acceptance of sentences of two and four years' confinement in the penitentiary, lest worse should befall them if they

fought their indictments in open court. Moreover, seven other convictions have been obtained by the Government, and one or more cases still await settle-In this sharp and severe treatment of men who violated trust and made wrongful profit out of their public offices, as in the case of the disaster and disgrace that have fallen on hitherto respected men because of the insurance disclosures, there is to be found a tonic for the public's moral health. The very fact that social and personal qualities make such men liked and arouse a certain sympathy not felt for coarser criminals adds to the effect of the lesson. The cheap pessimists who are always sneering at honest ideals, and asserting that in dealing with cities or the Nation everybody will take graft if he can get it, will learn that outward respectability does not secure safety from penalty, and that even the possession of political influence may not protect the guilty. The Government has carried on these investigations and prosecutions for two years without the slightest regard for the accused's party affiliation, without stinting expense, and with tireless persistence. The result has amply repaid the effort, not in the infliction of suffering upon delinquents, but in vindicating public honor and justice.

Conspicuous among

the events of the past

Internal Dissension Among the Mine Workers

several weeks emphasizing what appears at this writing to be a drifting of the United Mine Workers toward a widespread strike of the coal mine employees of the entire country on April 1, have been the internal dissensions among prominent officials and members of this organization. These differences culminated last week in the issuing of an injunction by Pittsburg Common Pleas Court No. 2, upon the application of Patrick Dolan, President of District 5 (Western Pennsylvania), restraining the District Convention then in session from removing him from the presidency, or from interfering with his performance of the duties of that office. John Mitchell, the National President of the organization, had previously ruled that the District Convention possessed such authority under the organization's constitution, regardless of the fact that the district president is elected by the members of the district union and not by its convention. The incident indicates a significant division, however small, among the officials as to the advisability of the strike policy outlined by the National Convention, since the Pittsburg district employs nearly 75,000 mine workers, of whom approximately 28,000 are members of the union. These do not appear to approve of President Dolan's attitude, as their District Convention has adopted a resolution declaring vacant the offices of president and vice-president. On the floor of the National Convention the delegates from this district, by an almost unanimous vote, denounced the action of President Dolan in voting with the operators in the Inter-State Joint Conference of the central competitive territory for a continuance of the present wage scale. The feeling against the action of President Dolan was also heightened by his vote, which was one of only three, against a resolution passed by the National Convention to the effect that no contract be signed in any district until all districts reach a settlement. This resolution has received much attention in the press, and is interpreted quite generally as meaning that the anthracite mine employees are prevented from entering into any agreement with their employers unless the soft-coal miners also secure a satisfactory contract. But as the inter-State joint conferences for the central competitive soft-coal territory (western Pennsylvania, Ohio, Indiana, and Illinois), and the southwestern fields (Missouri, Kansas, Arkansas, Indian Territory, and Texas), have so far failed in securing such contracts, it would more than ever appear that the National Convention had in view a general suspension of coal-mining.

(2)

The Conference in New York

Despite this conclusion from the facts before us, representatives of anthracite mine employees and hard-coal operators met in New York last week

A proposed

presumably with the object of entering into an agreement governing wages and conditions of employment in that industry after March 31, when the Anthracite Coal Strike Commission's award expires. Nothing definite as to the progress of this conference, other than the submission of the mine workers' demands and the appointment of sub-committees to take up these demands for discussion. has been made public. It is the belief of persons well informed as to the policy of the United Mine Workers that if a satisfactory agreement can be made with the anthracite operators the resolution of the National Convention above referred to can be rescinded by a special con-Notwithstanding the peace vention. outlook for the anthracite fields, the internal dissensions among the leaders of the mine workers tend rather to encourage open hostilities with the bituminous coal operators. President Mitchell is on record in the proceedings of the National Convention as well as of the Inter-State Joint Conference that "so far as my advice may be followed, the United Mine Workers of America will not accept a settlement on the basis of the present wage contract." This means, of course, that unless the operators recede from their positive and reiterated position in opposition to any wage increase there will be a suspension of coal-mining on April 1 in the larger number of the thirty-one coal-producing States and Territories. It was to prevent such an outcome, claims District President Dolan in a letter to the public, that he voted as he did to continue the present con-"I know," he says, "that, in the face of the resolution to tie up all districts until all have settled, nothing but a miracle or a complete backdown upon the part of the miners would avert a tremendous strike, the end of which none can foresee, but which threatens us and the country with terrible loss. was alone in my vote, but I was not alone in my opinion." There can be no question that President Mitchell has the confidence and will have the support of the rank and file of the more than 300,-000 members of his organization, despite the fact that the dissensions reported from Pittsburg will affect mine workers

here and there throughout the country. Judging from the expressed sentiments of the delegates at the Indianapolis convention last month, the United Mine Workers organization is carrying the country towards a great industrial war. There is still hope that such a catastrophe will be averted by a reconvening of the Inter-State Joint Conferences and National Convention before April 1. In the meantime the coal-mining industry is receiving attention from other quarters.

Congressional Investigation of Coal-Carrying Railroads

investigation of the softcoal carrying railroads by Congress has developed gradually out of the debate in the House on the Hepburn bill for regulating inter-State commerce. It first took form in the resolution by Representative Gillespie, of Texas, calling upon the President to have the Inter-State Commerce Commission report to the House the status of what is known as the Pennsylvania Railroad "community of interest" and its relation to the Inter-State Commerce Law. The report transmitted to the House by the Commission merely recited wellknown facts as to the relations between the Pennsylvania, the Baltimore and Ohio, the Chesapeake and Ohio, the Norfolk and Western, and the Northern Central railroad companies, through the ownership of stock and the holding of directorships in these various companies. The report proved unsatisfactory to the House, and a more drastic resolution was passed, calling upon the Inter-State Commerce Commission to make a sweeping investigation of the Pennsylvania "community of interest" arrangement and to report its findings to the House. In the meantime the Senate, having begun its debate upon the railway rate regulation issue, also naturally drifted into a resolution somewhat similar in purport to that of the House. It was introduced by Senator Tillman, of South Carolina, and after detailing in general terms charges of discrimination and favoritism by railroads in their relation to coalmining companies, and alleging a combination of common carriers in restraint

of trade, the resolution authorizes and instructs the Inter-State Commerce Commission to investigate and report: First, whether any railroads own or have any interest in, by means of stock ownership in other corporations or otherwise, any of the coal or other products which they carry over their lines. Second, whether the officers of any railroads (including those distributing cars or furnishing facilities to shippers) are interested, by means of stock ownership or otherwise, in corporations or companies owning, operating, leasing, or otherwise interested in any coal mines, coal properties, or any other traffic over the railroads with which they are connected or employed. Third, whether there is a combination in restraint of trade among the carriers of bituminous coal, and, if there is a monopoly in the soft-coal industry, to what extent are the output of coal mines and the price of coal limited and The Commission is also to controlled. report the effects of such conditions, if they are found to exist as described, upon independent coal operators and the consumers of coal. A very important provision of the resolution is that requiring the Commission to investigate and report the system of car distribution in effect upon the several railway lines engaged in the transportation of bituminous coal, and whether the systems are fair and equitable and carried out fairly and properly. The Commission is required to suggest a remedy as well as to report any facts or conclusions which it may think pertinent to the general inquiry. The resolution has been adopted by the Senate by an almost unanimous vote, which action followed the reading of a letter from Governor Dawson, of West Virginia, who claims in substance that West Virginia is in the grasp of a monopoly of which the chief offender is the Pennsylvania Railroad.

(2)

At the same time that Congress was engaged with its resolutions of inquiry into the soft-coal carrying railroads, the situation existing in consequence of the arrangement among the eight anthracite-carrying railroads

was receiving attention from the Legislature of Pennsylvania. That body has passed a resolution directing the Attorney-General of the State to inquire into the conditions under which railroads are engaged in hard-coal mining contrary to the State Constitution, and, if he finds that conditions warrant such a proceeding, to institute suit against such companies. President Baer, of the Reading system practically the dominating head of the hard-coal carrying systems—replied to the resolution in a letter to the public in which he explains the status of his company in its relation to the State Constitution, claiming that it is not engaged in coal-mining in violation of the State Constitution, but that, on the contrary, these rights are explicitly conferred upon it by its charter, granted prior to the adoption of the present Constitution. President Baer also gives figures as to the distribution of the cost making up the increase in the price of coal the past several years, and invites an investigation of the books of his company. This opportunity the Pennsylvania Legislature seized upon at once. and has created a commission for the purpose of examining into conditions among the anthracite carriers which are subject to the laws of Pennsylvania.

☻

The recent tendency

Taxation of toward the abandon-Personal Property ment of the tax on personal property because of the inequities of its operation is emphasized by statements issued by Governor Folk, of Missouri, in connection with his appointment of a Commission to report on the revenue laws of the State to the Legislature at its next session. The Governor says that the State's revenues are in such shape that it may dispense with the personal property tax, and may secure a sufficient income from real estate, from the public service corporations, and from other forms of property. His reasons for singling out personal property for exemption so far as taxation for State purposes is concerned are those commonly urged by modern authorities on

the subject.

makes a true return," he says, "the

"The honest man who

farmer, and those whose personal property is visible will pay less under the proposed system. The man who now dodges will pay more." He points out the obvious fact that a farmer's stock, machinery, and crops are readily found by the assessor, and that estates of widows and orphans that go through the probate court must pay in full, while the personal property of well-to-do business men frequently escapes taxation. Since the State has a surplus of revenue, the Governor urges that these considerations make it advisable to exempt personal property rather than to lower the tax rate. His suggestion, of course, has to do with State taxes only. He would leave it to the various communities to determine whether personalty shall be taxed for local purposes. Two of the members of the tax commission whom Governor Folk has appointed are Dr. Isidor Loeb, Professor of Political Science in the University of Missouri, and Mr. F. N. Judson, the eminent St. Louis attorney, and author of a volume on "Taxation in Missouri," in which the abandonment of the personal property tax is advocated. It is significant that an influential Governor in such an important matter should have ranged himself with the experts in political science. The Outlook hopes that the State of Missouri will adopt Governor Folk's recommendation, and so set an example for other States to follow. It is a wise because a just change in taxation.

•

The contest over the Rapid Transit in Elsberg Rapid Transit New York City Bill now before the Cities Committee of the New York State Senate has two entirely distinct aspects which should not be confused. First, there is a disagreement as to what the chief provision of the hill actually means, and what its effect would be if enacted. It is claimed, on the one hand, by those who favor the bill in its present form, that it merely permits the Board of Rapid Transit Commissioners to let separate contracts for the construction and operation of future subways. On the other side it is contended that the bill would make the separation of construction and

operating contracts compulsory. ambiguity which makes possible such diametrically opposed interpretations by intelligent men stamps the bill, in the opinion of The Outlook, as a bad one. No measure should be enacted into law which is not perfectly clear in meaning. Besides this difference of opinion as to what the bill really provides, there is a more fundamental disagreement as to what it ought to provide. The radical believers in municipal operation as well as municipal ownership of rapid transit lines favor such an amendment as would be mandatory upon the Rapid Transit Commission to separate construction and operating contracts, and would prohibit the letting of a contract for operation until the road should be substantially completed. The movement to secure such a provision seems to The Outlook an attempt to secure municipal operation by indirection. If no bids for a contract to operate a subway could be asked for until the subway were completed, it might very easily happen that the city would find itself without any adequate offers, and compelled to operate the road itself. Whether municipal operation is desirable or not we do not here discuss. But if the principle is to be adopted, it should be done in an open and straightforward way, and not through a measure that purports to aim at something else. The conservative view. probably held chiefly by those who are interested in the present transportation companies in New York, is that the present subway is so successful that the Legislature should let well enough alone. The middle ground between these extremes is held, among others, by the City Club, which has prepared a bill as a substitute for that of Senator Elsberg. The bill provides in unmistakably clear language that the Rapid Transit Commission shall be given full discretion, subject to the approval of the Board of Estimate and Apportionment, to let contracts for construction, equipment, and operation, either separately or jointly, in any way that will in their judgment provide rapid transit facilities most quickly and most advantageously to the city. It further provides that any contract for the operation of a future subway shall

expire in 1954, when that for the present subway expires, or at an earlier date if so determined by the Commission. Outlook believes that this bill should be substituted for the Elsberg measure, and should be passed. It would make more certain the preservation of the principle that the city shall own its subways, no matter who operates them. It would place the Rapid Transit Commission and the Board of Estimate and Apportionment in a strategic position with regard to the interests which are aiming to secure absolute control of the rapid transit facilities of New York City. It would permit municipal operation whenever the people of the city should demand it through their representatives on those boards, or whenever the offers for private operation should prove unsatisfactory or inadequate.

⊕

A great effort in the South Legislation is going on in behalf of for Children children this winter. In Maryland, for instance (outside of Baltimore and three other counties), there is no restriction whatever on the work of children: and in Baltimore, where there is nominally restriction, they are free to work if they have dependent relatives or are dependent on themselves. The bill before the Maryland Legislature provides that no children shall work at any industry until they are really twelve years old, the age limit to be increased the following year to thirteen, and the next year to fourteen. It will apply in all the counties and to all children. whether with dependent relatives or not, since the community can look after such relatives in a more economical way than by ruining the health of little children for a pittance. For five successive years an attempt has been made to get similar legislation in Georgia, but every year the number of children at work in Georgia factories has increased. Children who ought to be in the kindergarten work all night in the cotton-mills. While the women at the meeting of the National Suffrage Association lately held in Baltimore were discussing this problem, and during the night, while they were sleep-

ing, there were in Maryland many hun-

dred little boys, only nominally twelve years old, working all night in the glass works, and very small messenger boys were threading the streets. In New York conditions are as serious, for children almost too young to enter the primary school—"five, six, seven, and eight years old-are working in cellars and garrets, sewing on buttons. making artificial flowers, and doing other real work," instead of being at school and According to the last census we have 580,000 children between the ages of ten and fourteen who can neither read nor write, native-born Americans. In this country two millions of children under sixteen are earning their own living. Great hope is entertained for an improvement of conditions in Southern districts if the bill before Congress for the regulation of child labor in the District of Columbia and the bill to provide a bureau in the interests of children can be passed. The chief emphasis of the Suffrage Association meeting was on the work for children. Whatever else that meeting stood for, it stood for the higher education of all who are capable of taking it, the general education of all citizens, and the safeguarding of the little ones, and no one was more earnest in supporting the convention in these efforts than Dr. Ira Remsen, President of Johns Hopkins University, and Dr. Welch, Professor of Pathology, who presided on different evenings.

6

The Chicago City Coun-Chicago Gets cil, on February 8, passed 85-Cent Gas an ordinance reducing the price of gas from one dollar to 85 cents per thousand cubic feet. The companies affected had indicated their willingness in advance to accept the reduced rate, and to put it into effect at once without protest or litigation. This action is the culmination of a long agitation in Chicago for cheaper gas. The amount of the reduction was not sufficient to satisfy many elements, as there was a widespread demand for 75-cent The new rate, however, is to be operative only for a five-year period, after which a still further reduction may be ordered. Fifteen or twenty years ago

Chicago tried to get cheaper gas through the introduction of competing companies. Franchises were granted to new groups of promoters, but it was not long before these new concerns were subject to the control of the old company, the People's Gas Light and Coke Company. trust that was formed, however, was declared illegal by the courts; consequently, in 1897, at the same time that the scandalous street railway legislation was passed by the General Assembly, the gas companies secured the passage of two laws designed to legalize their mo-One authorized the consolidanopoly. tion of existing companies, and the other made it unlawful for the City Council to grant any further gas franchises except upon conditions as to frontage, consents that were practically impossible of fulfillment. The people were so disgusted with the outcome of the efforts to secure relief through competing companies that they made no effort to bring about the repeal of these measures. There did develop, however, a strong sentiment in favor of legal regulation of the price of gas. In 1900 the City Council passed an ordinance fixing the price of gas at 75 cents, although recognizing that it probably lacked the power from the Legislature to enforce such an ordinance. This ordinance has been in litigation ever since. The Illinois Legislature at its last session passed a law conferring upon the Chicago City Council the express power to regulate the price of gas.

1

After this measure was Fixing the Price adopted the companies indicated a disposition to come to a peaceable settlement with the city. The Ogden Gas Company was already selling gas at 90 cents within the very limited territory served by it. The People's Gas Light and Coke Company offered to reduce its price from \$1 to 90 cents. It presented to the Council committee figures showing the cost of manufacture and distribution of gas to be 53½ cents. This company, which has a capitalization of \$68,000,000, claimed that it was entitled to 35 cents per thousand feet as a reasonable allowance for interest charges and dividends.

The Ogden Gas Company gave its cost of manufacture and distribution as 491/2 cents. The companies would not make public their accounts, but the People's Company allowed a firm of accountants named by the committee to go over its books to verify the figures given, under a pledge of secrecy as to everything but the conclusions arrived at. This firm found the cost of manufacture and distribution, as shown by the company's books, to be 45½ cents per thousand feet instead of 53½ cents, as had been claimed. The accountants contended that certain items, the character of which they did not explain, carried on the company's books were not properly chargeable to cost. The figures of 45 1/2 cents included six cents per thousand feet for renewals and repairs. Professor E. W. Bemis, Superintendent of the Water Department of Cleveland, Mr. E. G. Cowdery, Manager of the St. Louis Gas Company, and Mr. Alexander C. Humphreys, President of Stevens Institute and formerly connected with the United Gas Improvement Company of Philadelphia, were called in as experts. They substantially agreed that the cost of manufacture and distribution of gas, including ten cents per thousand feet for renewals and repairs, should be about 52 cents. The differences of opinion arose over the proper amount that should be allowed for interest and profit. The whole question of reasonableness turned upon whether allowance should be made for the water in the capitaliza-The companies admitted that their capitalization was greater than the actual investment in the plants, but said that they had been obliged to buy up competing companies to which the city had unwisely granted franchises to enter the field, and that this element in their capitalization must be taken into consideration. Professor Bemis ignored these claims, and, on the basis of his estimated value of the tangible property, contended that 75 cents was a reasonable rate. Mayor Dunne took strong ground in favor of an ordinance fixing 75 cents as the maximum rate. The committee and the City Council were moved to compromise on the 85-cent rate largely by the consideration that the companies

would put it into operation at once without protest, whereas an attempt to pass an ordinance fixing a lower rate would be met by litigation and delay. At the meeting of the Chicago City Council on February 14 Mayor Dunne vetoed the 85-cent gas ordinance, but the measure was immediately passed over his veto by the vote of 57 to 10. The new rate goes into effect at once, and gas used during the month of February will be charged for at the reduced price. In vetoing the ordinance Mayor Dunne contended that 85 cents was not low enough; that the companies at that rate ought at least to furnish free gas to the city, and that the ordinance otherwise contained features detrimental to public interests.

1

The accession to power Sidney Sonnino, as Prime Minister of Prime Minister Baron Sidney Sonnino marks a distinct phase in Italian political development. The Liberals and the Radicals have had their chance; the logical result of their long enjoyment of power is now seen in the return of Conservative control. As in England the Conservatives must expiate their shortcomings so in Italy the Radicals must. He would be a churlish critic, however. who would not give full credit to the Radicals for what they have done for Italy, especially to ex-Premier Giolitti for his astute action during the general strike, by which he succeeded in forcing the Socialists into two camps—State Socialists and revolutionaries. Ex Premier Fortis, who has just retired from office, though perhaps as much of an opportunist as Signor Giolitti, was less successful as a leader. However, in the adjustment of State ownership of railways to the demands of labor, Signor Fortis proved an unexpectedly able negotiator. Towards the Roman Catholic Church the attitude of Radicals has been one of an assumed ignoring of the existence of that body. The absurdity of such a course has borne its own fruit. Sincere Roman Catholics who are also sincere supporters of the Government have no notion of being cut off from a part in the civil administration, despite Pius IX.'s encyclical declaring that it was not expedient for faithful sons of the Church to vote at Government elections. As years went by, the encyclical lost more and more of its force and now has been practically abrogated by Pius X.

(6)

When a new session of any The British British Parliament opens, Parliament there is always a great crowd outside the Houses at Westminster cheering or hooting, according to their political bias, the better-known members, while never-failing enthusiasm is evoked by the arrival of the Yeomen of the Guard to make the search of the vaults, lest another Guy Fawkes lie in waiting there to blow up Parliament! Of course in these respects last week's assembling of Parliament proved no exception to the rule. Inside the Houses, however, there were exceptional scenes because of the new Parliament itself. The leaders were cheered by their adherents in the House of Commons, the Conservatives trying to veil the recent electoral table-turning and the consequent fewness of their members by extra enthusiasm. official called "Black Rod" finally entered and summoned the Commons to the House of Lords, where five royal commissioners wearing robes of scarlet and ermine sat on a bench in front of the throne to receive the Commoners and to deliver the royal commission opening Parliament. The Lord Chancellor then announced that, as soon as the members of both Houses had been sworn, the King "would declare the cause of his calling Parliament together," adding that the "gentlemen of the House of Commons" must appoint "some proper person" to be their Speaker and " present him on the following day for his Majesty's approval." Upon the Commoners' withdrawal the peers met to present their writs and subscribe to the oath, those who had recently succeeded to their titles being introduced in their Meanwhile the Commons had robes. proceeded to the election of a Speaker. The clerk of the House, who is not allowed to speak, solemnly arose and pointed his finger at Sir Wilfrid Lawson, the oldest member in point of service. In his turn Sir Wilfrid arose and, ad-

dressing the clerk, moved in set phraseology the re-election of Mr. James William Lowther. In accordance with precedent, there was no opposition; Mr. Lowther expressed his thanks, and the House adjourned. On the following day about four hundred supporters of the late Conservative-Unionist coalition Cabinet met and passed a vote of confidence in Mr. Balfour as leader-not, however, before the publication on that day of correspondence between Mr. Balfour and Mr. Chamberlain in which the former seemed practically to surrender his retaliationist principles to Mr. Chamberlain's simon-pure protectionist ideas, though placing certain limitations upon acceptance of "a general tariff," with its special inclusion of a duty on corn. The "Daily Graphic," speaking on behalf of the free-traders, who had once supported the late Cabinet, deplores Mr. Balfour's "journey to Canossa" as the price of his retention as leader. As Pope Gregory VII. only emphasized his power by compelling the German Emperor to go to him at Canossa, so, nine centuries later, Mr. Chamberlain has accentuated his own power at the expense of the official party leader.

₩

The full dimensions The Liberal-Laborite of the recent victory Victory of the English Liberal and Labor parties at the polls may best be seen by comparing the present status of political parties with that which issued from the elections in 1900. In that year the Conservative-Unionists elected 402 members to the House of Commons; this year they have elected, as reported, 157; in 1900 the Liberal and Laborite parties elected 186 members; this year they have elected 430; in 1900 the Irish Nationalists elected 82 members: this year they are reported to have elected 83. This would indicate a Liberal majority exceeding 80 over all other parties; the Liberal and Laborite majority over Conservative-Unionists and Nationalists to be 190; the majority represented by Liberals, Laborites, and Irish Nationalists if they vote together, 356. Not only are these figures impressive, but we should not lose

sight of the fact that the Conservative loss—245 seats—is unprecedented since 1832, the largest Conservative loss since that historic year being 142 seats in 1886. We may also go back to 1832 and to the forties to find an analogous case of the use of political power. For in 1906 the victory is not only a Liberal but a Labor victory, just as sixty and seventy years ago the manufacturers defeated the landowners at the polls. Since then England has followed what is now a time-honored fiscal policy, yet the emphasis given to this policy during these recent weeks is not more important, we believe, than is the birth of the Labor party. That this should have come about under conditions hardly favorable to labor representation shows a gratifying power of co-operation on the part of workmen in providing for the financial sinews not only of an election, but also for the future in sending so large a body of representatives to a Parliament whose members receive no salary. It has been said that the birth of the Labor party marks a peaceful revolution in England. It is rather an evolution. It has certainly been accomplished by non-revolu-The new party is a constitionists. The only disquieting tutional party. questions arising from its birth seem to be: By a somewhat exclusive interest in one subject, will its policy be parochial or imperial? and, by yielding to the possible temptations of vote-trafficking, will it practice politics rather than statesmanship?

When a Government, What Power Shall like that of Morocco, Control Morocco? has shown itself hopelessly uncivilized, the civilized Powers are acting rightly if they try to reform Having assured the supremacy of the executive of that Government (as has been done by the Powers in conference at Algeciras, Spain, for the Moroccan Sultan), there are two ways, among others, to gain control of the country: by supervising the finances, or the The latter of these subjects was under discussion last week at Algeciras, and has provoked an apparent deadlock between France and Germany. As France is the only Power whose

territories abut upon Morocco to any great extent, and as she has long had more direct interests there than any other Power, she not unnaturally claims special recognition in Morocco because of these geographical and historical relations. In particular, she claims the right of reorganizing the Moroccan police, as, by reason of her long Algerian frontier, she would be the Power principally affected by anything less effective than the reorganization which she would compel. On the other hand, Germany, at whose request the Algeciras conference was called, stands for the equal treatment of all nations. This, her representatives think, might be accomplished in three ways: (1) By leaving the police control to Morocco; (2) by exercising it through a concert of the Powers; (3) by confiding it to a minor Power. If there is to be reform, the first of these three proposals is of course not to be entertained; as to the second, the cases of Crete and Macedonia are by no means reassuring; as to the third, the disquieting suspicion might arise that the particular "minor Power" was Germany's tool. There are two fair compromises, we think. would be, in the light of England's creditable history in Egypt, to give the police control to France in return for the latter's solemn pledge that it shall not instigate her to arrogate other exclusive rights, and, in particular, any which would conflict with the principle of the "open door." The second compromise would be to accept Germany's suggestion that the police be controlled by a minor Power—that Power may be Switzerland, the freest from suspicion of anv-and that to France, as a quid pro quo, be granted the other form of control, the financial, which would represent the Moroccan foreign debt, largely held in France, and would also have charge of the Sultan's future borrowings.

(8)

Unrest in China last week increased rather than decreased the general anxiety as to any immediate untoward results arising from the development of the spirit of nationalism. This spirit definitely arose eight years ago. Through the efforts of

certain reformers the Chinese Emperor was led to see that only in educational reform was there hope for the conservation of the Empire's integrity. Accordingly he issued a series of such startling edicts that he was quickly overthrown by the reactionaries, the Empress Dowager at their head. She has continued in power ever since, but has herself become sufficiently convinced of the necessity of incorporating certain features of American and European civilization into China as lately to lend considerable countenance to liberal changes in administration. During the Boxer period (1900) the new liberal spirit of nationalism was overthrown, of course, by the temporary triumph of the reactionaries with their bigoted and fanatical spirit of nationalism. Now, however, we have in some places a union of the two spirits a desire on the part of many Chinese to keep foreigners away from China, yet at the same time to incorporate the liberal reforms suggested by those foreigners. If these are resisted by the Government, the spirit quickly becomes antidynastic, especially in the south, where a strong anti-dynastic spirit has long reigned, for the Chinese there have never quite yielded to their Manchu conquer-Coincidently, in the south the greatest difficulty with regard to America has arisen, since most of the coolies come from the southern provinces, and, in general, from Shanghai in the east and from Hankau in the west, to the southernmost boundary, there has been apparently more mercantile jealousy and anti-foreign spirit than elsewhere. Thus for the present unrest there are, among others, five causes: (1) The anti-dynastic spirit; (2) the liberal nationalistic spirit of 1898; (3) the reactionary nationalistic spirit of 1900; (4) the anti-foreign spirit in general—greatly strengthened since Japan's defeat of Russia; and (5) the anti-American spirit in particular.

(8)

Religion, Education, and Commerce Disturbed has manifested itself in religious, educational, and mercantile domains. As to the first, the Viceroy of the province of Fukien has been ordered to

execute the leader of the mob which destroyed the Roman Catholic and English Presbyterian missions at Changpu a fortnight ago, and has been commanded to punish severely all others concerned in that affair. As to the supposed dismissal of Professor C. D. Tenney, we note that his resignation is still under consideration by the Viceroy of the Province of Chili. If this very powerful Viceroy cannot stem the tide of public opinion in behalf of one to whom he had hitherto shown favor, that opinion must indeed Dr. Tenney well deserved be strong. such favor, as he had organized a new system of education throughout the province, a model for similar work throughout China. As to commerce, Mr. Schwerin, Vice-President of the Pacific Mail Steamship Company, which has much to do with Chinese trade, is reported to have said that our commerce with China is practically gone; that it had been all lost since 1900, when we were the most popular foreigners with the Chinese; that the general awakening is largely due to the work of the Chinese Empire Reform Association, which teaches the reorganization of the Empire on modern lines. Dr. Morrison, the well-informed correspondent of the London "Times," reports: "All the Legation guards have been warned that danger is impending." special danger is the spread of secret societies in the army. Hence six regiments with artillery have been despatched from the capital to Chinchau, perhaps from the fear that they were honeycombed not only by anti-foreign but also by anti-dynastic feeling. Mr. Conger, late American Minister to China, is quoted as saying that serious trouble will come, and that it will be directed against the dynasty rather than against America, though Americans within the zone of the rebellion are liable to be hurt before they can get out; hence it would be the part of wisdom to have our war-ships and troops ready (as they have recently been made ready), if only for the purpose of letting China know that we are watching her. Whatever good may be accomplished by such knowledge, a certain amount of exasperation on the part of the Chinese must also be

taken into consideration. Another diplomat, long resident in China, Mr. Charles Denby, declares that, while the boycott started with the intention solely of forcing modification of our Exclusion Act, it is now extending to an effort towards the total removal of restriction on all Chinese persons, the Chinese Government, however, not being interested beyond the point of responding to popular pressure, which represents the growing spirit of patriotism, the increased appreciation of Chinese citizenship, and consequent resentment at any discriminations. It has taken at least eight years to bring the apparently inert masses of China to the present point. The question arises, How long will it take to allay the present unrest?

American Education

Last week at Har-

and

vard

for the Chinese Universities and at Wellesley College definite and generous propositions were made towards granting the privileges of instruction at those institutions free to Chinese students. Harvard offers ten scholarships, Yale twelve, and Wellesley three. Some of the students, whether men or women, will pay their own expenses as private applicants; others are, it is understood, to be nominated by the Chinese Government, and are to be sent to America at its expense. For a period of four years, however, the instruction under the new scholarships is to be free. In our opinion, nothing has yet been done in this country which will have a greater or more lasting effect in persuading the Chinese that Americans are friendly and not hostile to them than this action authorized by Presidents Eliot, Hadley, and Hazard. This proposal by Harvard, Yale, and Wellesley might well be followed by a similar offer from every American educational institution which has the ability to carry it out. Instead of twenty-five free scholarships, as now provided, we should have five hundred. The men who came over from China to America thirty-five years ago with Yung-Wing

did not finish their courses of study in

America, but, despite the fragmentary

character of those courses, became ulti-

mately important factors in promoting

all that pertains to the higher life in China. religiously, educationally, and politically. Every Chinese student to whom we can now give a fairly complete university course would be, not only a promoter of friendship between America and China, but a guide and an inspiration to China's new civilization.

In these recent weeks American Law the subject of educa-Taught in France tional reciprocity between America and Europe is receiving deservingly increased emphasis. has been shown especially by the success of the Cecil Rhodes scholarships at Oxford for foreign students, and by that of the interchange of professors between the University of Berlin and Columbia University. It is a satisfaction also to chronicle the interest taken both by the faculties and the students in the lectures on Anglo-American common law which Mr. Charles F. Beach, Jr., a well-known legal authority, is now delivering, following out a plan of his own, at the Universities of Paris and Lille. Mr. Beach's course is introductory and general-leading to specialization in later years. The lecturer speaks for forty-five or fifty minutes in French and fills the remaining parts of the hour with a résumé in English, which is appreciated by the students both for its intrinsic worth and also as an exercise in Mr. Beach hopes a foreign tongue. ultimately to bring about the foundation of a chair of Anglo-American law in the Paris law school (with supplementary courses each year at one or more of the provincial universities), together with a good working reference American law library in connection with the Paris law library. No similar collection of American law books is to be found on the other side of the Atlantic. -Such a library, in a center like Paris, would be not only invaluable to students but a great convenience to lawyers everywhere whose professional business brings them to Europe. The influence of Mr. Beach's lectures may be better apprehended when we remember that at Paris there are about eighteen thousand students, of whom about five thousand are in the law school: at Lille there are about two thousand students, of whom about four hundred are in the law school. Thus at Paris there are more than twice as many students as are to be found at any German university, and about half as many as at all the German universities put together. The University of Lille is of course less well known than the University of Paris. Lille lies close to the Belgian border. With its immense iron and cotton industries, it is a great manufacturing center, while, with its suburbs, it is a center of population in France second only to Paris. The University of Lille dates from the days of Charles V., and the law school from 1562. The faculties of law, letters, medicine, and science are luxuriously housed. Mr. Beach's course at Paris and Lille closes at Easter; he then goes south to the Universities of Bordeaux and Toulouse, for the spring session in France, as in Germany, lasts well throughout the summer.

6

A bill which is now The Regulation of before the New Jer-Automobiles sey Legislature embodies in legal phraseology the feeling of animosity toward motor-cars which reckless drivers of these cars have done their worst to arouse. The bill imposes special licenses upon automobiles, which are laid with especial rigor-upon tourists temporarily in the State. It puts restrictions upon automobile users and provides severe penalties for the violation of its provisions. The introduction of this bill has called forth from three societies interested in the subject a letter which sets forth very sanely some principles which ought to govern automobile regulation. This letter states first that the automobile must be made to act "in harmony with other users of the roads;" it is therefore wrong to permit it to become a nuisance for the price of a license, for thereby a class of vested rights is created that is a menace to the community. Moreover, such a license makes a discrimination in vehicles which will not be salutary. The law should deal with these machines so that they can be "kept in a position to be used as a cheap freight-carrier-milk to the creamery,

horticultural and agricultural products to market, and other necessities back to the farm." Instead of a license these societies urge a registration fee to be issued "under the police power of the State, to provide for the identification of the owners of the machines." When it is remembered that in New York State alone the number of automobiles increased from about nine hundred in 1901 to twenty-three thousand in 1905, there can be no doubt that the question of regulating automobiles is one that will become more and more important. present the matter of most pressing necessity is an effective measure by which irresponsible users of the automobile can be summarily called to aecount. Speed regulations are unfortunately, as a rule, a dead letter. If reckless driving were prohibited, and then the question what constituted reckless driving in each case were to be settled as any other question of fact, we think that each community would be in a position to protect the users of its own highways more effectively than at present.

The withdrawal of The Case of the Dr. Gigot and other American Sulpicians Roman Catholic priests of St. Joseph's Seminary, Yonkers, New York, from the Society of St. Sulpice has been misinterpreted as an act of suspension by their superiors on account of their inclination to liberal theology. As a matter of fact their withdrawal was a voluntary act, only indirectly occasioned by questions The Sulpician community of theology. is a free society, whose members are bound by no vows. Its purpose has been to further theological education. It is French in origin, and its organization has been centralized in Paris. When the French Government expelled the orders, the Sulpician community, though not strictly an order, was disrupted. Consequently the American branch of the Society suffered from disorganization. St. Joseph's Seminary, which is a Catholic theological school. been under the direction of Sulpicians. Dr. Gigot, of the Seminary, has been a scholarly and open-minded student of Biblical criticism. Some of his

associates last summer established a periodical named the "New York Review," devoted to "the Ancient Faith and Modern Thought." The Sulpician Society, on the other hand, has been controlled by a traditional spirit. The collapse of the Society in France and the unlikelihood of any autonomy being established in America led to the decision that the Seminary had better be put under the immediate charge of Archbishop Farley, of New York. The members of the order in Yonkers therefore withdrew, and were admitted to the body of diocesan clergy of New York. They all remain at their posts in the Seminary. Although it is possible that the ultrarigid censor regulations enforced by the superiors of the Sulpician Society in France may have hastened the change, it was the disruption of the Society itself that made that change inevitable.

The inquiry which has The Wreck of the followed the wreck of Valencia the Valencia off Vancouver Island last month has indicated that many of the same causes which resulted in the appalling loss of life on the excursion steamer General Slocum in New York harbor a year and a half ago were operating in this disaster. Defective life-preservers and an imperfectly disciplined crew together account for much of the loss of life. there is evidence that the supply of lifesaving stations, signal stations, and telegraph or telephone lines on the Pacific coast is altogether inadequate. Is it not time that Congress took some action in revising thoroughly the laws which are supposed to protect those who travel

More Church
Union

Within two months two strong unions have been agreed upon by two groups of churches of different denominations. In December, as reported in The Outlook of January 13, the Congregational, Methodist, and Presbyterian Churches of Canada agreed to unite; this month, at Dayton, Ohio, the headquarters of the United Brethren, the Congregational, Methodist Protestant, and United Brethren Churches in our own country

by water?

agreed to do likewise in accordance with the plan initiated at Pittsburg in 1903 by committees of the three denominations. Their delegated commissioners, numbering over two hundred, manifested the same unanimity that had marked the previous stages of their mutual approach in accepting the proposed scheme of This now is referred back to the union. National meetings of the constituent bodies for ratification and adoption. Two years or more will be required for this, but no doubt of the ratification is now entertained. Questions of property interests will have to be threshed out by lawyers, but these are said to present no insuperable obstacle to union. The difficulty of combining the decentralized Congregational churches with others more centralized has been surmounted, at least in the plan of organization. This leaves the local churches autonomous as now, and provides for a National Conference, in which every ten thousand members will have one delegate. Provision is also made for annual conferences within State limits. Superintendents elected by these, and the President of the National Conference, are to devote their entire time to the work of the united churches—a highly desirable improvement of the traditional method of Congregationalism. The most significant feature of the union is its doctrinal basis, whose brevity and evangelical simplicity are in marked contrast to the scholastic orthodoxy of the creed adopted by the United Church of Canada. Peculiarly noteworthy is its emphasis on the longneglected social side of Christianity:

We believe that, according to Christ's law, men of the Christian faith exist wholly for the service of man, not only in holding forth the Word of Life, but in the support of works and institutions of piety and charity, in the maintenance of human freedom, in the deliverance of all those that are oppressed, in the enforcement of civic justice, and the rebuke of all unrighteousness.

The union thus formed numbers some eleven hundred thousand communicants, of whom the Congregationalists constitute about seven-elevenths, while the remaining four-elevenths are about equally divided between the other two denominations. These are strongest in Maryland, Pennsylvania, southern Ohio, and the Central West, where Congregationalists are comparatively few. The Methodist Protestants separated from the Methodist Episcopal body in 1828 for the sake of lay representation in the Conferences, conceded subsequently. The United Brethren came out from the German Reformed Church about 1789 for the sake of freedom in promoting evangelism and religious revivals. their union each of the three bodies contributes to the others a desirable element. The example set by them and by the Canadian churches will have its effect on other bodies among whom the tendency to union is already astir.

The Marriage

Miss Alice Lee Roosevelt, the eldest daughof Miss Roosevelt ter of the President, was married to Mr. Nicholas Longworth. Representative in Congress from Ohio, on Saturday afternoon last at the White House. There was a brilliant and large assemblage present of relatives, friends, and official personages, and perfect weather and admirable arrangements for the reception of guests made the scene of the ceremony, which took place in the famous East Room, a picturesque and notable one. The ceremony, which was that prescribed by the Protestant Episcopal Church, was performed by the Right Rev. Henry Y. Satterlee, Bishop of Washington, assisted by the Rev. Roland Cotton Smith, rector of St. John's Church, Washington, of which Mrs. Roosevelt is a regular communicant. There were many reasons why the occasion was of very genuine popular interest, not only in this country, but throughout the world. An event of such great personal significance to the President and his family directed the thoughts of all his friends to the White House on the day of the wedding, and no man in the world to-day has a greater body of friendly and affectionate admirers than Mr. Roosevelt. Gifts and greetings and congratulations came to the bride from all parts of the world, many of which she would be the first to recognize as tributes to her father quite as much as to herself. The Outlook begs to join in these world-wide good wishes and greetings.

This is Not Socialism

The movement to bring the railways of the country under Federal supervision, and that to make the municipalities the owners of the public utilities—water, lighting, transportation, etc.—are essentially one movement. It is neither communism nor socialism; it is not, properly speaking, either communistic or socialistic. Communism is the doctrine that all property should be owned in common. Socialism is the doctrine that the government should own all the tools and implements of industry, and carry on all the industries. Both are fatal to private property and to individual in-This movement does not assail the right of private property; but it does attempt to get for the common people the benefit of the common property. It does not attempt to interfere with individual industry; but it does attempt to secure public control of public industries.

The natural right of private-property rests in the last analysis on the right of man to himself. For the product of his labor is a part of himself; into it he has put himself. Into the picture of the artist, the box of the carpenter, the grain of the farmer, the book of the author, some part of the vital energy of the brain and of the muscle of the worker has gone. It is this that makes the product truly his.

But there are immense values which are not thus the product of any individual's labor. They have been made for man, not by man. He has not by his industry created the coal, or the oil, or the forests, or the prairies. To these natural products he has no natural right. It is sometimes said that we have robbed the Indians of this continent. That is not true. This continent never belonged to the Indians. The fact that they roamed over it did not make it theirs. At the most they owned only the land they cultivated, and that was a very insignificant portion of the continent.

In so far as the coal operators own the coal mines, or the Standard Oil Company the oil wells, or the great mining companies the gold and silver and copper mines, or the great lumbermen the forests, it is because society by arti-

ficial arrangements has given them a title to these gifts of nature—that is, of God. And this society has done because either it has been ignorant and careless, or because it has believed that the best way to secure the practical benefits of the common wealth for the common people was by a scheme of individual ownership and control. This is no finespun theory. It is actual fact. For while the absolute right of a man to the product of his own labor is universally recognized, the right of the owner of the land and its contents is always defined and often limited by law, it is different in different States, and in different epochs in the same State.

To secure the better distribution of this common wealth among the common people society has created artificial persons called corporations. A corporation is a combination by which many hundreds of people jointly own and share in the profits of a property too large to be owned by one individual; a combination by which administration is unified and profits are divided. When corporations which were created to promote the distribution of wealth become an instrument for the concentration of wealth. society has a right to intervene. they fail to fulfill the purpose for which society created them, society which created them has a right to require of them a change in their methods. Society is no Frankenstein, helpless in the presence of the machine it has itself called The machine is its servant, into being. not its master; and the service which its master has a right to demand of it is the just and equable distribution of the common wealth, which by natural law belongs to the whole community, and which has become personal property only by artificial law.

But not only these natural values have been put by society into the possession of these artificial persons called corporations; it has also put under their control the public highways. The railways are the highways of the Nation, and they have become private property. The streets of the city are the highways of the city, and they have become quasi private property. And what has made them so is the act of society, which has

either carelessly allowed them to pass from the control of the public to the control of private owners, or has deliberately done so because it has believed that private ownership and administration for private profit would serve the public better than public ownership and administration.

Two fundamental questions thus underlie both the National movement for Federal regulation of the railways and the city movements for municipal ownership of public utilities. On these two questions the opinion of The Outlook is definite and clear.

First: Is there any difference between a private person and a corporation? or has the corporation all the rights which belong to the private person?

Answer: The corporation has not all the rights which belong to a private person. It is an artificial person created by society; it is created in order to serve society, and society which created it has a right to require it to fulfill its intended function; and if it refuses so to do, society has a right to unmake it. This right it must exercise by just and legal methods; but it is a right, and sooner or later society will find a way to exercise it in so far as such exercise is necessary for its protection.

Second: Is there any difference between the property rights of an individual in the product of his own labor and the property rights of either an individual or a corporation in such natural objects as coal, oil, forests, land, air, and water?

Answer. There is a radical difference. The right of the producer in the products of private labor is absolute; the right of ownership in the earth and its contents is wholly due to artificial arrangements which society has made, and society which has made those arrangements has a right to modify or to unmake them, provided that in so doing it has a due regard to its own promises, express or implied, and is careful not to do greater injury by changes too sweeping or too sudden than the community is now suffering from present conditions.

In other words, society, which has made the present artificial arrangements for the control and administration of the common wealth, has a right to modify these arrangements so that the common wealth shall be administered for the common benefit. This is not communism; it is not socialism; it is common sense.

The Inspiring Vision

The United States has no better representative abroad, no truer ambassador of its highest life, than Bishop Brent, of the Philippine Islands, who stands in a remote part of the world, among a people for whose well-being the United States is largely responsible, as the exponent of the spiritual ardor, the religious aspiration, the passion for humanity, of the best Americans. Such a book as "Adventure for God," which has recently come from the hands of this distinguished missionary, conveys by its title a suggestion of a feeling for religion, a faith in God, and a desire to serve man which place him with a small group of those who, in a century occupied with tasks and works, still hunger for righteousness and follow after the vision of the Divine as the best men and women did in other days when tasks were fewer and work was less pressing. If men at the beginning of the twentieth century do not feel the presence and power of the Infinite as they felt these things in the time of Job, it must be remembered that Job's interests were few, that he had only a single kind of work to do, and that he was not separated and kept apart from the ultimate questions of life by incessant occupation, and the tremendous and unescapable pressure of the activity of the later centuries.

And yet while it is true that the preoccupations of modern life are not so much the fault of the time as the very necessity of its manifold and marvelous material development, it is also true that men cannot live by bread alone, and that when there is no open vision the people perish. Appeals for practical helpfulness, for the interpretation of religion in terms of human service, for the church which has an open door for the worker and holds out a hand to the outcast, speak more and more loudly, as they ought to speak, and with an insistence

which cannot be escaped. The modern Church must deal with modern men by rnodern methods in modern speech. That is the only way in which it can repeat in the twentieth century the service which it rendered in the second, the eleventh, the sixteenth. But the Church in the twentieth century, like that of the sixteenth, the eleventh, or the second century, cannot do its work, bear its burdens, or keep its altars pure without constant freshening of its faith, constant clearing of its vision. Altars, however beautifully adorned and faithfully tended. are vain unless the Spirit of God is there; and the Spirit of God is with those who take time to think about him and to serve him, not simply from a sense of duty, in practical ways and works, but under the inspiration of a steady vision of his presence and nature.

It is this view of religion which Bishop Brent urges in his "Adventure for God "-a view which involves not only the practical and rational work of the day, but the passion of the earliest Church and the romantic temper of the mediæval Church. It is not as a form of self-sacrifice, as a surrender of some of the best things in life, that Bishop Brent interprets the missionary career; it is rather as an opportunity which appeals chiefly and most strongly to imaginative and spiritual men of large ability and commanding purpose; the life which is in itself one of the greatest of careers, and offers the noblest of rewards. " What has been termed 'respectable inefficiency," writes Bishop Brent, "among the clergy, is more often due to poverty of inner experience than lack of technical training. I can conceive of no more wretched fate than for a young man to find himself in the ministry, solemnly commissioned to give a vision to others without ever having had one himself; charged with the duty of spiritualizing the commonplace activities of his fellows without ever having spiritualized his own. . . . Elisha made the young man see the horses and chariots of fire because he himself saw them. . . . There is no instance of an Apostle being driven abroad under the compulsion of a bald command. Each one went as a lover to his betrothed on his appointed errand.

It was all instinctive and natural. They were equally controlled by the common vision, but they had severally personal visions which drew them whither they were needed."

It is in the vision and by the vision that men live great lives and are able to lead other men into strength and peace. It is the men of vision who rise above the dust of the highway, who see the stars, and charge their tasks, their duties, and their work with the spirit of sacrifice and with the consciousness that all tasks and work are part of the spiritual education, who make men willing to endure routine, to bear drudgery, and to give their strength out in a thousand details of daily toil instead of the one great adventure for which they long. was by the vision of the spiritual unity of the country that Mr. Lincoln was sustained. It was the constant presence of the vision of the spiritual order in the world that made Phillips Brooks not so much priest as prophet; one who stood on a mountain and held men enchained by the picture of the larger landscape which unrolled itself before him.

The Leadership of Germany

Quite lately Mr. J. J. Hill, one of the highest authorities on organized finance in this country, and one of its most farseeing business men, commented on the wastefulness of Americans in the use of their resources, while Dr. Pritchett, in the current number of the "Review of Reviews," describes the sagacity and intelligence with which Germany is using science to aid her industrial development. While a host of Americans are ruthlessly cutting down forests, exhausting rich soils, handling properties possessed of great possibilities of future development for the purpose of getting the largest sum of money out of them at the earliest possible date, instead of developing them as solid and large-earning properties, Germany is husbanding her resources, studying the possibilities of her development, and, with a rare combination of statesmanlike foresight and trained intelligence, steadily

making her way to the front. At the close of the war with France, Germany was comparatively a poor country. agricultural and mineral resources are limited; she has a great army to maintain, involving not only a vast expenditure of money, but the withdrawal from the field of active work of a very considerable part of the working population; and she has suffered heavily from the drainage of her population by emigration. In this country, on the other hand, resources are practically unlimited, taxation is relatively light, army duty does not exist, and, instead of being depleted by emigration, the country is constantly filled by immigration.

Yet, measuring the two countries by their relative resources, Germany has steadily gained on the United States, and that gain has been due almost entirely to foresight and education. The Outlook has more than once commented upon the extraordinary sagacity of the German Emperor, who, on his accession to the throne, saw clearly that, in order to maintain her position, Germany stood in need of a far-seeing and thoroughly applied policy of industrial development. defined that policy at an early date, and he has never deviated from it. It is due in no small measure to his clear perception of what Germany needed, and to the skill with which he has evoked the expert ability of the Empire, and to his tireless industry, that Germany now stands in the front rank of the nations of the world, and leads them all in the application of science to industry.

There has been nothing haphazard or accidental about this remarkable achievement. The habit of discipline and the thoroughness of training which made Germany a century and a half ago the first country in the world in point of scholarly research, and a generation ago revealed her as the most thoroughly organized country from the military point of view, with the most admirably equipped and highly educated army, has been put into business and has produced the same results.

The German university, the breedingplace of scholars and the nursery of knowledge, has of late years been feeding the factories and putting expert men

into every department of trade. When the thoroughly trained chemist can be persuaded to set up a laboratory in connection with a private business, the owner of that business becomes at once a successful competitor against the man who relies solely on native sagacity and the usual methods of trade advance. The chemist and the laboratory in the factory mean the manufacture of the product below the cost of its manufacture in the rival establishment where science has no recognition. The German Government, which has so firm a hand on the whole educational system of the Empire, has persistently and consistently done its utmost to make places in connection with the industries attractive to men of science. It has established schools of applied science in various forms; it has developed the most thorough business schools in the world; it has not only trained its young men in all the methods of business, but has made them accomplished linguists, so that when they go out in large numbers to the farthest corners of the world they carry with them a knowledge of the language of the people with whom they are to work. In this way, by taking science into partnership, by giving business men a scientific education. by studying the possibilities of trade through consuls and agents in all parts of the world, Germany has set an example and has achieved a success which put our easy-going methods, our wastefulness, our indifference to thorough training, our unbusinesslike and humiliating use of consular service for political instead of business uses, to shame. We have prided ourselves on our business capacity, and there has been reason for our pride; but when we remember how much has been done for us in the way of natural capitalization of the continent and how little has been done for the Germans, and compare what they have done with their limited resources and what we have done with our unlimited resources, it ought to silence the tall talk in which some of our public men are in the habit of indulging, which is simply a flamboyant advertisement of their own ignorance, and make us willing to take lessons of an educated business people.

Dr. Pritchett emphasizes the strong

1906 national spirit which has been developed by the accomplishment of German unity; the same spirit, however, has been developed in this country since the close of the Civil War. He brings into clear relief one of the great secrets of the industrial power of Germany in its development of the spirit of research through its universities, which for years past have trained an army of men These exto be expert investigators. perts have now turned their attention to industrial problems, and the fruits of their investigation and research are being placed at the service of the material evolution of the Empire. A single example of the way in which the German Government fosters the business interests of the country is afforded by the evolution of the Royal Testing Office, which began its career about thirty-five years ago in testing the strength and nature of such materials as iron, building stones, cement, and brick, and in conducting chemical and metallurgical investigations concerning the construction of steel and iron, chemical substances used in commerce, and chemical properties of the soil. ginning in a series of detached laboratories, this work has now been housed in a great technical school in the suburbs of Berlin, and has become a national research and experiment station in which all the resources of science are at the command of the manufacturer. If a manufacturer confronts a problem which he is unable to solve by reason of limited means, he takes it to the research laboratory, and the Government co-operates with him. If a builder or an owner

anywhere in Germany discovers a stone

which he thinks may be valuable for

building purposes, he sends it to the

laboratory to be tested. Machines, tex-

tiles, cotton thread, beams of iron and

steel, chemical substances—everything,

in fact, that enters into the material side of modern life—are examined and their

value determined by experts at the ex-

pense of the Government. Our Government has made some advance in this direction, and is maintaining experiment

stations which are largely devoted to

agricultural and mechanical instruction

and experiment; but nothing has been

done here on the scale of the great

German institution. It is in a way the key to the growth of modern Germany, and it has immense meaning for the United States and for England. Both countries must wake up to the fact that business without science under modern conditions is doomed to failure.

Is it Safe to Study the New Testament?

There are two creditable grounds for opposition to the scientific study of the Bible. One ground is honest fear that by such study the foundations of faith will be undermined. This fear, it might be said, arises from smallness of faith; if the faith were large enough, and established not on externals but on spiritual experience and conviction, there would be no fear of its destruction. Nevertheless faith, even if it is timid, The other ground of demands respect. opposition to the scientific study of the Bible is the natural repugnance to the analysis of that which is intimate and sacred. This is due, not to the smallness of faith, but to its depth and reality. There are some experiences which seem to have a right to privacy; and religious faith is one of these. The instinct that would preserve it from rough handling is natural and right.

Both of these reasons for dislike of the so-called Higher Criticism become intensified when it is proposed to apply the principles of criticism to the New Testament. Concern for the foundations of religion becomes stronger when the statements of the New Testament are subjected to scrutiny, because the facts of the New Testament seem to be much nearer the foundation than the facts of the Old Testament. Doubt as to whether Elisha really made the ax-head float seems to have little immediate connection with personal religion; but doubt as to whether Jesus actually performed the miracle of feeding the five thousand touches very closely the matter of loyalty to Christ which is the heart of the Christian's faith. Repugnance to the scientific examination of what is counted sacred also becomes stronger in the case

of the New Testament than in the case of the Old, because the New Testament is much the more closely involved with personal religion. Even in the Psalms, full of personal religion as they are, questions of authorship and date make comparatively little difference; but in the sayings attributed to Jesus questions of authorship seem almost heartless to one who treasures these sayings as from his Lord.

As a consequence of these perfectly intelligible feelings of fear and repugnance aroused by the suggestion of New Testament criticism, much of the saner study of the New Testament has not been thorough, and much of the fearless study of the New Testament has been directed by men who have not been devout, and therefore have been mechanical in their methods. The conclusions of modern scholarship regarding the Old Testament have become current among the more thoughtful of the people; but even such conclusions as modern scholarship has reached regarding the New Testament remain the possession of but a very few. Most of the books which have popularized the results of Biblical study have dealt with the Old Testament, and therefore the growing interest in the literary study of the Bible is confined to an interest in the Old Testament.

This state of affairs is not wholesome. It does not promote either sincerity or freedom of religion. It is not right that the New Testament, which is for Christians the most vital part of the Bible, should be the part most open to erroneous interpretation, and most promotive of ignorance, even though it be a devout ignorance. If modern critical scholarship illuminates what it touches, it will bring light upon the New Testament as well as the Old; upon the life and character of Jesus as upon the person and influence of Moses or David or Isaiah. Literalism has been the nurse of almost every form of eccentric offshoot from Christianity. Mormonism, Dowieism, and even Christian Science are based upon the acceptance of Scriptural statements as verbally Such cults cannot stand where scholarship holds sway. Atheism of the Robert Ingersoll type has become grotesquely antiquated, for it is based upon the assumption that the believer must accept as literal fact whatever he finds within the Bible; it is therefore made powerless by the assumption on the part of the believer that he has liberty of discrimination. The critical study of the Old Testament has freed the Old Testament from this hurtful and superstition-breeding literalism. It can free the New Testament likewise.

It is therefore the duty of those who prize the New Testament most highly, and who have most certainly found it an inexhaustible source of faith, to guide the critical study of it, and to accept with open minds the results of such study. It is neither right nor safe that such study be relegated to those who prize the New Testament least, nor that only those should be free to accept the truth who seek it merely to satisfy their curiosity.

This is the significance of a letter which has recently been signed by fourscore clergymen and laymen of the Episcopal Church. Originally prepared in England and signed by seventeen hundred clergymen of the Church of England, it has been accepted, mutandis mutatis, as an expression of a conviction that applies to religious conditions in America. It records a "sense of the grave and manifold religious issues involved in the present critical discussions," a desire "that as many of the clergy have already welcomed important results of a patient, reverent, and progressive criticism of the Old Testament, so the clergy, as Christian teachers, may now receive authoritative encouragement to face the critical problems of the New Testament with entire candor, reverence for God and his truth, and loyalty to the Church of Christ;" a fear "lest the door of ordination should be closed to men who patiently and reverently apply historical methods to the Gospel records:" a conviction "that it is not without grave responsibility and peril that any of us should build the faith of souls primarily upon details of New Testament narrative, the historical validity of which must ultimately be determined in the court of trained research;" and a confidence "that the faith of the Church in the years to come, whatever historical revisions may await us, will stand, without risk and without discontinuity, upon the spiritual foundations to which Christian experience and the Creed of the Church alike bear testimony."

This action of clergymen of the Church of England and clergymen and laymen of the Episcopal Church in America is a stimulating example to men of like mind in other churches. The Church by this time has learned that skepticism is cultivated by the attempt forcibly to suppress free inquiry into religious truth; such an action as this should be imitated, because it proclaims the principle that to encourage fearless inquiry is the best way in which to disarm skepticism.

The Spectator

The Spectator had the pleasure of meeting the other day a gentleman, no longer in his first youth, but by no means what one would call an elderly man, who has given a great deal of his time and attention to the breeding and training of horses. Naturally, the use and the utility of the horse are a good deal in his mind, so that when the conversation goes horsewards he is generally not displeased. The Spectator, knowing this, remarked the fact that he had seen the statement that day that, notwithstanding the use of automobiles and electric tramways in New York and the other great cities, quite one-half of the accidents in the streets were still.attributable to horses. "And why not?" the Spectator's friend asked. "Any one is considered good enough and capable enough to drive a horse, while men are trained and regularly taught to drive automobiles and electric cars. It is rather astonishing, considering the ignorant chaps in the grocery and butcher carts, that more of us are not killed. I tell you it is impossible now to cross over a crowded street in New York and preserve your dignity and your life at the same time. You owe your life to the nimbleness of your heels, and your dignity you leave behind as you flee. They charge you first on one side of the car track and then on the other. Lickitysplit they come, cabs, wagons, vans, automobiles, every blessed driver trying to bowl the pedestrian out. Why, it will soon be as bad as in Paris, where I have heard that the cabman who runs down the most foot-passengers in a year is rewarded with the Legion of Honor.

☻

" Any one is thought good enough to intrust a horse to," the Spectator's friend continued; "why, last autumn, when the drivers of the mail wagons went on strike, it was decided by the postal authorities that there was no virtue in the position of the strikers because driving was not skilled labor, but could be done by any man of ordinary intelligence. I do not recall what the strike was about for shorter hours or higher wages, or both, I do not recall—but the idea of saving that skill is not needed in the driving of horses indicates to me that the authority who made the ruling knew nothing about the noble art of horsemanship. I feel almost warranted in saying that he did not have even the ordinary intelligence to which he referred in his ruling.

"And driving is an art, an art that may be acquired only through practice, instruction, and imitation. It does not come merely by the light of nature. Some persons can acquire a foreign tongue with what seems an easy facility, while others of equal mentality have the greatest difficulty and never succeed in any eminent degree. Those to whom the acquirement of foreign tongues is easy have a gift for languages, just as some others have a gift for mathematics or for rhyming or for drawing. And so it is with driving. To some driving comes easily, to others it is difficult, while some others seem incapable of learning. In driving it appears the easiest thing in the world to say 'get up' when it is desired to start, or to say 'whoa' when it is desired to stop; to pull on the right rein to go to the right and on the left rein to go to the left. I sincerely believe that in the popular mind that last sentence is a complete compendium and manual of instruction for drivers. That is the reason we have so many accidents. It seems so easy

that comparatively few ever take the trouble to learn driving as a fine art. 'I have sometimes,' says a recent writer on the subject, 'been nearly scared out of my wits in driving with a man or woman whose every act displayed ignorance of even first principles. Probably no more grievous insult could be paid to a man than to betray lack of confidence in his capacity to drive, and latterly, when I have been asked to go with a man even to the golf links two miles away, when I knew he did not know how to handle the reins or manage a horse, I have blandly declined. Death comes to all of us, but there seems to be a lack of wisdom in seeking it in such an ignoble fashion.'

"When a grocer or a butcher or any user of a delivery wagon needs a driver, he takes the first chap that comes alonga fat German boy, a newly landed Italian lad—without reference to experience or qualifications. In cities this should be prohibited by ordinance. This inexperience is too dangerous to be tolerated; besides, it is cruel to the horses that are so used. It takes experience to know what may and what may not be done with a horse. Horse-owners would consult their own interests and save money by hiring only competent drivers; but these tradesmen alluded to are handicapped by their own ignorance. In New York the greatest offenders against the proprieties and courtesies of the road are the drivers of the delivery wagons of the yellow journals and the drivers of the mail vans. The yellow journals get their rules of the road from the same storehouse of cheek that they draw their other obnoxious supplies from; the mail-wagon drivers do as they please under the mistaken notion that there is something sacred and superior in their occupation in carrying the mails that raises them above all local laws. Of course such an idea is pure nonsense. An employee of the United States is just as amenable to local laws as any other citizen. But the idea carries weight, for the mailcarrying contractors are permitted to use horses so unfit for work that the Society for the Prevention of Cruelty to Animals should interfere.

may be added to all this that a man driving a horse must drive all the time to do his full duty to the horse and to others he may meet or pass. There are hundreds of little things that should never be neglected, but the first great principle is to keep your eye on your horse. The horse is not the wonderfully intelligent animal that some think him; on the contrary, he has very little intelligence considering his close relations to mankind. It is the driver who should be intelligent in his control of the horse, and convey his intelligence to the horse by the reins, the whip, and by speech. Genius, some one once said, consisted in the infinite capacity to take That is a capital definition of the art of driving—the good driver must take pains, and keep on taking pains."

(2)

When the Spectator had got this far in telling what his friend thought about drivers and driving, it was necessary for him to leave his desk and go out into the As he was going over Fourth Avenue, though his mind was perfectly alert, he got wedged in a group of vehicles traveling at different rates of speed. A newspaper wagon struck him slantingly, threw him in front of a grocery cart, which knocked him down, when he was run over by a truck. The next thing the Spectator knew he found himself on a cot in a hospital. As no very serious damage was done, he was back home in a week; but he had lost a week of time, while he had undoubtedly suffered much pain. Bruises and contusions get well, but they are not pleasant when they are green. While the Spectator was lying in the hospital, he could not help wondering whether those drivers who ran him down had not in some occult way known of what he was doing before he ventured out into the street. If they did know, they had their revenge in advance of the offense. The only satisfaction the Spectator possibly has is that his painful mishap supplies a personal illustration of the truth of what his horse-loving friend had told him some time before. This, then, may be properly called a personally conducted excursion into an old field.

EVERETT COLBY, THE MAN WHO "GOT MAD"

BY JESSE LYNCH WILLIAMS

T so happened that about the first thing I ever heard Mr. Colby say seemed to explain in a sentence why he is succeeding where so many men of his own sort have failed—though that was not the intention of his remark.

I was asking him to tell me just how he happened to go into the now famous fight last year which smashed the machine, busted his boss, and, best of all, frightened the boss's bosses so thoroughly that within the last few weeks they have actually surrendered (shrewdly enough—pending the expected reaction!) and are preparing legislation in accordance with the demands of the platform on which he won his place as the youngest State Senator of New Jersey.

Now, I had warned him that The Outlook had asked me to write something about him, and here was a good chance for him to intimate delicately that, "recognizing the sovereign right of the people, perceiving how they were being misrepresented, he considered it his sacred duty, at the sacrifice of time and money, to throw himself into the breach," or something of that sort. Moreover, this could have been backed up, for I knew that in his fight against the railroad and allied corporate interests which owned the government of New Jersey he had spent about thirty thousand dollars of his own money inherited from a railroad-builder. His father was the late Charles L. Colby, of the Wisconsin Central Railroad. I knew, too. how hard he had worked all last summer, giving up his plans for fun and absenting himself almost entirely from his young wife, which he probably considered a greater sacrifice.

However, this was his answer: "Well, you know," he said, with a smile very different from that of a self-satisfied reformer, "I'd like to think I saw a vision or got religion over night, but as a matter of fact it was because I got mad."

This is not a mere illustration of Mr. Colby's engaging candor, which pleases the people, who nine times out of ten know a real man when they see onethough few of the bosses and fewer reformers seem to understand this—the unexplosive kind of candor which appeals to voters as much as it perplexes the bosses and annoys their employers, including both the hypocritical kind and the "honest grafters" who would feel so much surer of "getting him eventually" if he only took the high and holy purpose This reply tells much more than that this firm-jawed, blue-eyed young man of thirty-one is a good fellow, with common sense and an adequate sense of humor, though that is important enough, especially since "they" are doing their best at the present moment to give him a big head—which again illustrates their shrewdness.

In the first place, Mr. Colby did not go into public life from an abstract sense of duty; if he had, the chances are that he would have gone out long since from a concrete sense of failure. He went into politics very much as he went in for football at Brown University not many years previously; he liked the game, he wanted to make the team, and also doubtless had a normal human desire to run with the ball. He is charged with ambition. I, for one, hope he is guilty of that terrible crime. But as he became captain of the best eleven his college ever turned out, and is now leading the most successful reform movement his State has ever known, and as it requires team-work to advance the ball in both these games, it looks as if he knew how to keep this normal human trait from developing abnormally.

But the chief reason Mr. Colby is making a success of reform is that he is not a Reformer. He was caught young, and did not go into the game with preconceived notions to work out. He played as he was coached from the side

1

lines—as long as he could play clean. Then he got mad and played his own game. The trouble with so many reformers is not that they do not know enough, but that they do not feel enough. They are working for abstract principles academically derived from the outside. Contrary to the popular notion, they often have a clearer and more comprehensive understanding of the situation than the bosses themselves, and can write books about it which serve as useful manuals for those who wish to become Complete Grafters. But reformers so seldom get all the way into the game. The reason is that it does not matter enough to them personally.

It matters so much to the bosses. They are there for business, "for my own pocket every time." It does not mean mere principle to them, it means interest. Likewise with railroads and other corporations whose very existence devolves on legislation. They are not always so much wickeder than we are; they are in politics for the same reason that keeps out most of us who yell at them—namely, blind absorption in their own affairs, the trait which makes the success of Americans and has been threatening the failure of America.

II.

It has been related how Mr. Colby's political ambition was lighted by the torches of political parades which used to stop at the Colby curbstone. The youngster told himself that when he grew up to be a man like his father, he, too, would make speeches. Most healthy American boys get about that far along in a political career. In this case, however, the flame was kept lighted, although nearly quenched by a period of yearning to become a stage-coach driver. while at college—he was in the class of '97—he went in not only for athletics, but for speaking and writing. a debater; he was one of the editors of the "Brown Magazine." Accordingly, after studying law and making a trip around the world, he "went into politics." He was led in by the hand of the great Major Lentz, the boss whom he afterwards overthrew.

It is unnecessary to repeat here the

intermediate details. It has already been done by a master hand. I can't help feeling, however, that Mr. Colby began to see what kind of game he was up against a little earlier than he is given credit for by Mr. Steffens. The trouble was that he did not get mad for some time, which was a good thing for him and the cause. His enemies, who are trying to make the most of everything, are now spreading the report that he is stupid. Incidentally, I may mention that each member of his cabinet-for he has adopted that team-work idea of Mayor Fagan's, the righteous and lovable Mayor of Jersey City—has been mentioned to me with great positiveness as being the real "brains" behind the movement. Mr. Colby is warm in his praise of all of them, each one supplying an entirely different quality-which shows his long head in the choice of a cabinet. one of his best advisers has not been mentioned at all, and that is Mrs. Colby. She is not only interested in what her husband is doing—which is rare enough, Mr. James says, in this country—but is of real use to him with her instinctive judgment of men and things.

But it really does not matter about where the brains behind the movement are kept so long as it continues to move in the right direction. Thus far it has done so, despite occasional bad advice from the inside as well as from the out. This is due in great part to the fact that "Colby is not a brilliant man," but cool, clear-headed, and capable, which is so much better. The conservative way in which he conducted a radical campaign shows that. The quiet, sagacious manner in which he is going about his job since indicates it, too-so convincingly that some of the friends he lost during the fight because he would not employ wild-eyed, yellow methods have since come back to him.

Every one grants that he has determination, but recently there have been signs to indicate that he has developed resourcefulness as well. He has grown a good deal during the past year. For instance, the adroit way in which he met the difficult question of bolting the caucus the other day when he took his seat in the Senate. He had had experience

EVERETT COLBY
From a new portrait made for The Outlook by Arthur Hewitt

in caucus-bolting already when he was in the Assembly. Moreover, he saw what a costly and dangerous thing it had proved for his friends this season in the House who got there on his ticket and had bolted at his advice. So when it came his turn to do the same trick in the Senate, he improved on it by simply putting the rest of the party on the defensive. He said in his quiet way that he didn't want any hard feeling, but as they knew as well as he did the platform on which he had been elected, and as he had asked in vain for an expression of an opinion on those points from the man proposed for Speaker, he thought that he had better quietly withdraw. He was about to do so; in fact, his hand was on the knob of the door when he was called back. They knew how important to the people Colby's platform looked by this time, and they knew how it would make them look if Senator Colby were forced out of the caucus on account of those issues. So they passed a resolution to the effect that Mr. Colby should remain and vote only on such questions as he saw fit to vote upon. This is a new wrinkle in caucus-bolting and ought to prove a powerful political weapon when properly wielded; better yet, perhaps, it will help to do away with the caucus evil entirely. Contrary to his expectations, they turned over to Senator Colby the full amount of patronage due the gentleman from Essex.

It may be that Mr. Colby's modest manner has misled some of his friends. as it has his enemies. However that may be, he had not been in the political game many months before he saw that the cards were stacked. He wanted to be appointed to the Committee on Railroads and Canals. His father had been a railroad man, and he was interested in that sort of thing. He carried a pocketful of letters from men whose opinions he guilelessly thought ought to convince the powers of his fitness for the position. But it was not a question of fitness with the powers. His uncle, Gardner R. Colby, had once wanted the nomination for Governor of the State, and had clashed with Sewell, the Pennsylvania Railroad's man. Therefore they feared young Colby might not

have the proper attitude toward the Pennsylvania Railroad, chief owner of the State. This opened his eyes not a It is an excellent example of the little. consistent thoroughness of the great, omniscient, sleepless System which during the past decade has implanted itself upon our entire Government, with the petty local bosses at the bottom of the unseen but weighty pyramid on up to the powerful apex in the United States Senate. If we on the outside can catch glimpses of this thing through the chinks of the cracking shell of representative government, it would be strange indeed if those inside could not see it. They are brought face to face with it every day; their every movement is hindered by it unless prompted by it. See it? Of course they see it, but what good does that do! It is not a question of knowledge, but of power. Colby saw it, and it "made him tired."

Now, if he had been a Reformer he would no doubt have tried to "do something" right away, before either he or the time was ripe, with the result that he would have become discouraged and quit like many another nice young man who goes into politics in order to reform it according to theories learned in col-But he did not want to quit. He liked the game, even though it was not all it was cracked up to be, and he kept on playing as he was coached—when he He declined to break his word, could. which they told him did not count "to a Democrat," in that matter of the Excise The bosses knew he could not be bought, so they tried bullying-it would Then cajolery—it had no not work. permanent effect. But they fooled him more than once. He was on the wrong side of the movement for equal taxation of the railroads, which was later one of the planks of his own platform. (Therewas great political capital for the opposition in this!) He made the average amount of mistakes, but he would not play double. He was showing signs of his future fight. They should have taken warning and got rid of him. But they liked him, wanted him, and had hopes of licking him into shape. It had been done so often before with others.

Even Mayor Fagan's historical letter

to the Governor, accusing the Republican party (which included Colby, and Fagan himself) of betraying the people who had elected them, did not make him try to do something. He was House leader at the time. He says he sat there stunned and ashamed. "But," he adds, to quote from Mr. Steffens's story, " even then, the truth falling like that didn't kill, didn't even change things essentially." He was not yet mad clean through, and it was not up to him personally. He, like Mark Fagan himself, supported the Republican party again that fall. What else could he do? Vote the Democratic ticket? His hands were tied, and nothing had happened as yet to make him mad enough to break loose and strike out with his fists, risking the consequences.

III.

The chief trolley system in New Jersev, and one of the joint owners of the government of the State along with the Pennsylvania Railroad, the Fidelity Trust Company, and the Prudential Life, is the "Public Service" corporation, which some people in our State consider a smugly humorous name for it. Now, to build trolley lines you must have franchises, and to hold franchises you must hold town councils in the palm of your hand. Of course it is easy enough for those of us who devote our energies to other lines of endeavors to call corporations names; but as long as we give away the rights to monopolize industries which are so remunerative, and as long as human nature remains as it is, there will always be plenty of shrewd men willing to take the necessary steps to have such gifts "given" to and retained by themselves; there will always be plenty of men in local governments willing to have the necessary steps made in their direction. No amount of reform, religion, or even social ostracism will eliminate this sort of thing; the prizes are too big. We do not allow the Government to go into business of this kind, which might be bad, so business gets into the Government, which is undoubtedly worse. If the Government does not own the monopolies, the monopolies will own the Government. This principle is at the

bottom of nearly all our corruption. It is not mere "big business" which makes the trouble, but specially privileged business—privileged by those who are the losers.

The Public Service is no worse and no better than many similar corporations throughout the country. They recognize their business necessities and comply with them with the cheerful capacity for self-deception which we all share to a greater or less degree. They believe in their trolleys and they believe in themselves. They look straight along the track of success, and thereby cultivate for other objects within their mental and moral range of vision a blind spot, which should be considered and treated not so much as a crime, but as a disease. They are "more to be pitied than scorned."

The Public Service commendably desired to extend the civilizing influence of their trolley system. They got up through East Orange, but they struck a snag when they came to Orange proper. So they decided that, as certain coy suburbs of Newark could not be seduced—which was more gentlemanly it would be necessary to abduct them. That is, they turned to the Legislature, of which they are large owners, to create a "Greater Newark." Thereupon the Orangemen in self-defense also decided to go to Legislature, and got up a modest little bill merely to forbid the granting of franchises for a period longer than twenty-five years. They did not wish to appear too presumptuous about their own streets, so they went about it politely, as it seemed to them. Their own legislators, however, seemed disinclined to back any such measure as that. haps to them it seemed audacious. Colby was asked to take it up, since he seemed to be an independent sort of a fellow. He heard that they were about to come to him, and he wanted to get both sides of the case before he did anything. So he took the first opportunity that presented itself of speaking to the president of the Public Service about the matter. "But he turned on me," says Mr. Colby, "as if my proposition merely to talk the matter over were a presumptuous impertinence. Hedeclared angrily that his company would not touch anything but perpetual franchises with a ten-foot pole, and turned his back on me."

"That was amazing enough," Mr. Colby says, but it was the next meeting with the trolley president that made him really mad. This was at a large luncheon at Trenton. The Public Service had heard that "young Colby" had not dropped the franchise matter, and it seems to have made the president furious. "You introduce that bill," he cried, in a voice which attracted the attention of the entire room, although Mr. Colby had not asked his advice in the matter at all—"you introduce that bill, and you lose every friend you have in Essex County!"

Now, the president of the Public Service Corporation has two elder brothers. The elder of these is the Attorney-General, who enjoys the confidence and warm esteem of the entire State, including Mr. Colby, who speaks in no uncertain terms of the Attorney-General's sympathetic and generous attitude towards him in the delicate position brought about by the ensuing fight against the trolley Towards the Public Service president's other brother his feelings are different. On the way home from that luncheon this brother, he says, took him in hand and tried to pour the oil of flattery on the troubled waters. "We think you have a great political future," he said, "and we don't want to see you throw it away." But it was not water now, but fire, the oil fell upon. He says it was such palpable flattery that it amused him even while it filled him with wrath and disgust.

That was all that was needed by this time to make him want to introduce it more than any bill in the world. He went home mad clean through.

The rest is now a well-known chapter in the political history of New Jersey. But from that day dated the reform movement now quietly spreading throughout every county of the State. It is an up-hill fight, and the future cannot be forecast. But this shows how a real man with the right stuff in him came to the parting of the ways, how the primitive man was aroused within him to help sweep the civilized man into the right path. He not only saw but felt now to what a farcical climax representative government was tending, when not only the will of the people was ignored, but their representatives, elected by them, presumably to carry out their own desires, were used for bringing about measures against them-and then were insulted and threatened for merely suggesting the consideration of their point of view! His fighting blood was up now; he did not care what it cost or whether it offended some of his friends or not. He no longer considered his friends, his future, or his own prefer-He was stirred to the depths. He wanted to break something. wanted to get out into the open and stand up and fight in man-fashion. And that is how he found himself; he will fight to a finish now.

QUEEN WILHELMINA

THE HOME LIFE OF THE QUEEN OF HOLLAND

BY HENRIETTE S. S. KUYPER

Mademoiselle Kuyper, who contributes this article about the Queen of Holland, is the daughter of his Excellency Dr. A. Kuyper, who for four years was Prime Minister of Holland, and before that for a score of years Professor of Theology and Literature in Amsterdam, and who is the author of many well-known books. Mademoiselle Kuyper knows Queen Wilhelmina personally, and what she says concerning the domestic relations of the Queen and her husband is worthy of the most implicit confidence.—The Editors.

URING the three months that I have spent in this delightful country I have been most thoroughly impressed with the interest the Americans take in my native country—Holland—and Queen Wilhelmina, a fact which contributes in no small degree to

make the visiting Hollander feel at home. But this most agreeable sensation is at the same time tempered by the discovery that almost every American believes in our Queen's unhappy domestic relations.

Wherever I have set my foot, sooner or later, often in evident concern, the

question has been asked, "Is Queen Wilhelmina happy with her husband?"

I have always been glad to answer with an enthusiastic affirmative, and to state the origin of the slander. This has been about my chief occupation while here—a "twice-told tale" in private and public, at dinners, receptions, and calls.

But what are drops removed, when an ocean has to be emptied? For this big wave of slander seems to have swept this whole country. We Netherlanders have always been famous for building

happy marriage, brought up amidst the environment of affectionate family life, she has no other wish than to profit by so noble an example, and conduct her own life in accordance. The marriage was a love match; nothing short of this would have been worthy of her or of the splendid education given to her by her mother.

The slander started with the dismissal of a coachman in the employ of the Queen Mother. To revenge himself he crossed the Channel to England and told

HET LOO, QUEEN WILHELMINA'S COUNTRY SEAT

From a photograph made by the Queen herself

dikes to free our country from invading waters. May I try, in a foreigner's limited vocabulary, to build a dike against this invading slander, which has absolutely no raison d'être?

Queen Wilhelmina and Prince Henry are perfectly devoted to each other. Our Queen has the same high ideals of marriage and home life that I have found in this country. A greater compliment I could not give either to her Majesty or to the American Nation. Born of a very

the English press he had Dutch court scandal to sell. It was at the time of the Boer War. Neither our country nor our Queen had nidden their sympathy for the Boer cause. I fear that the English press was only too glad to purchase, and so "hurt two birds with one shot."

It became a "shot heard round the world." Are not we apt to pity those we love? The rapidity with which the false report spread, the ease with which it was believed, tell in a very pathetic way of our young Queen's popularity.

Especially so in this country. In Holland, however, the slander has never been credited.

Though my task is finished, I know my readers will feel disappointed if I do not tell something personal of our "little Queen," as she is mostly called here. "Little" she is, indeed-but we don't think this to her disadvantage. belongs to her country; a little Queen of little Holland. And yet a Queenave! every inch a queen! She shows to the best in evening dress at one of the court functions. Though moving about among stately gentlewomen and proud matrons, no one would for a moment mistake the little lady of beautiful complexion, wearing such magnificent diamonds, to be other than the Queen. Hers is, indeed, the wonderful mystery of majesty-in her look, in her voice, in her attitude. And yet, with it all, she combines the freshness of buoyant youth. This combination gives a wonderful charm to her personality, which no one who has the honor to meet her can fail to be impressed by.

As to our Queen's character and talents, I could not better picture her than to say that she is thoroughly Dutch. She shows all the characteristics of our nation in her simplicity, sense of duty. love for the home life, instinctive dislike of display and society. Her manifold social duties are faithfully performed, but as a duty, not as a pleasure. Her happiness begins when she leaves, with the Prince, The Hague and court demands to take up the informal life at Het Loo, her lovely country seat in the province of Gelderland. Here they drive together without any attendance through the beautiful woods, and at picturesque points the Queen will leave her carriage to paint some lovely bit of landscape. She is very clever with her brush, and expert at amateur photography. She is not particularly musical. In sympathy with her nation, her chief talent lies, not in the world of sound, but in the world of color—a talent combined

with a passionate love of the Dutch landscape.

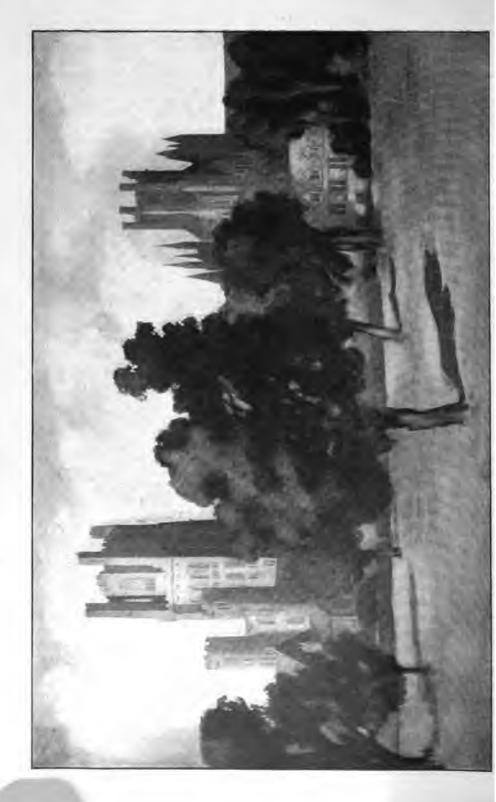

Like the average Hollander, our Queen cares little for travel. Neither the grandest mountain scenery nor the wealthiest world city compares in her eyes to the unique charm of one Dutch windmill reflecting in the quiet little canal, or of one typical village half asleep between its horizon of green meadows.

The Queen has a decided taste for Dutch language and literature. She has a musical voice, and is a remarkable speaker. Her wise mother, knowing that one of her principal duties would be public speaking, had her trained accordingly, and it is a sincere pleasure to hear her deliver a speech, in a voice clear and melodious and in perfect style. She makes a special point of preparation for these speeches.

Her strong sense of duty is perhaps nowhere better shown than in the difficult task of reigning over her independent little country. To be a sovereign, and yet bound at almost every step to an elaborate democratic constitution; to be conservative with the conservatives, progressive with the radicals; to have a mind for art, an eye for science, an ear to the social needs; to please all, to harm none—be the country great or small, the task of the modern sovereign is a difficult one, requiring talent, force of character, and the well-balanced conception of mature age.

Our Queen had just passed her eighteenth birthday when the regal symbols were laid in her hands. Yet I have more than once heard her Ministers say that she entered into the detail of law and administration in a way "most admirable."

I hope that it may be my American mission to Europe to correct a part of the Old World of some of its prejudices against America. If I may have corrected a part of America's false impression concerning our Queen's marriage, I shall feel that my European mission to America has not failed in its highest aim.

To the Robin in Ety Catnedral

(St. Bartholomew's Day, 1905)

By Charles W. Stubbs

Dean of Elv

"Beati qui habitant in domo tua, Domine! in sæcula sæculorum laudabunt te."-Ps. lxxxiv. 5.

T

O blithesome brother Robin,
God bless thy scarlet breast,
So joyously proclaiming
Thy merry heart's behest!
What hast thou here to tell us,
Here in God's sacred place,
That thou hast donn'd red cassock,
A chorister of grace?

Thou singest, singest, singest,
High on the lofty screen,
Till all the nave roof-spaces
Echo thy plaintive keen.
And when out peals the organ
Its deepest, fullest chord,
Thy flute-like treble answers,
"Let all men praise the Lord!"

TTT

And now before the altar
Crooning thy sweetest notes,
Thy "Gloria in excelsis"
Soft o'er the stillness floats
O merry, happy Robin,
Tell me what thou wouldst say
To these good minster people,
What means thy pious lay?

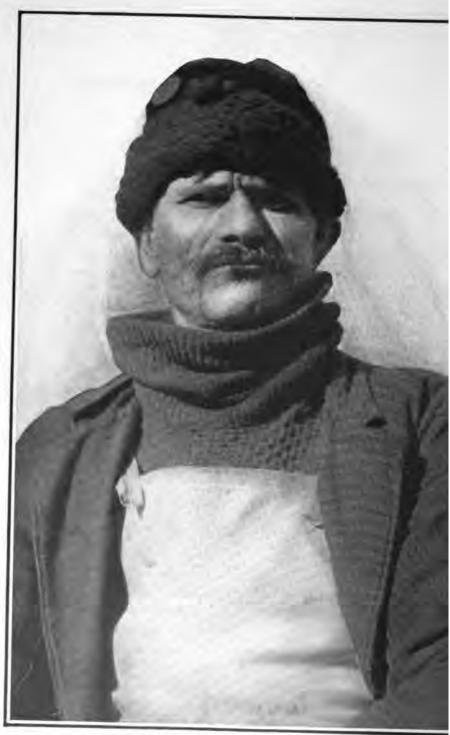

IV.

"I mean, I mean men should be
As bright and blithe as I,
And learn the heart of gladness
In all things to descry.
Be merry, merry,
Is all that I would say.
The sad heart soon grows weary,
The glad goes all the day."

The Deanery, Ely.

V.

O happy brother Robin,
Uplift thy pious song.
Thy brave voice echoes gayly
Our minster aisles along.
Pour out thy notes, sweet singer,
Thou bird that man loves best,
Thrice welcome to our choir-place,
God bless thy scarlet breast!

THE MAN WHO IS DIGGING OUR SUBWAYS

THE COMING OF THE ITALIAN

BY JOHN FOSTER CARR

ILLUSTRATED FROM PHOTOGRAPHS BY ARTHUR HEWITT

TEVER judge a ship from the shore," say the Tuscans, and the contadino, who is fond of proverbs, often quotes this bit of traditional wisdom when he finds that his wolf was only a gray dog after all. Hamlet's cloud is not a camel; nor is an honest workman a shiftless beggar buffoon. The laborer and not the organ-grinder now represents the Italian in America; but the popular idea mistakes the one for the other. Thanks to the secluded ways of Italians, the actual facts of their life among us are almost entirely unknown. In common with Mexicans and Jews, they are pilloried by insulting nicknames. They are charged with pauperism, crime, and degraded living, and they are judged unheard and almost un-These short and sturdy laborers, who swing along the streets with their heavy stride early in the morning and late at night, deserve better of the coun-They are doing the work of men, and they are the full equals of any national army of peasant adventurers that ever landed on our shores.

To brand an Italian immigrant with the word "alien" is to curse him for being unlike ourselves. But when we know who and what he is, and why he comes to the United States, and what he becomes after he gets here, we recognize human kinship, and see what we ourselves should be with different birth and breeding. One serious misconception starts in a name. It is as misleading to dub a nation "Latin" as "Anglo-Saxon." Italians differ from one another almost as much as men can differ who are still of the same color. Ethnography now makes its classifications according to cranial formation. Most northern Italians are of the Alpine race and have short, broad skulls. southern Italians are of the Mediterranean race and have long, narrow skulls. Between the two lies a broad strip of country, in northern and central Italy,

peopled by those of mixed blood. History has a less theoretical story to tell, and explains the differences that separate near neighbors, in the north as in the south. If a single race ever inhabited Italy to form an original parent stock, it has borne the grafts of so many other races that all sign of it is lost. For prolonged periods sometimes one part of the land, sometimes another, and sometimes the whole peninsula and the islands, have been held in the power of Phœnicians, Greeks, the countless wild hordes of the North, the Saracens, the Spanish, French, and Germans. They all came in great numbers and freely married with native women. In the northeast there is a Slav intermixture. and a trace of the Mongol, In appearance the Italian may be anything from a tow-headed Teuton to a swarthy Arab. Varying with the district from which he comes, in manner he may be rough and boisterous; suave, fluent, and gesticulative; or grave and silent.

These differences extend to the very essentials of life. The provinces of Italy are radically unlike, not only in dress, cookery, and customs, but in character, thought, and speech. A distinct change of dialect is often found in a morning's walk, and it would probably be impossible to travel fifty miles along any road in Italy without meeting greater differences in language than can be found in our English anywhere between Maine and California. The schools, the army, and the navy are now carrying the Italian language to the remotest province, but an ignorant Valtellinese, from the mountains of the north, and an ignorant Neapolitan have as yet no means of understanding each other; and, what is more remarkable, the speech of the unschooled peasant of Genoa is unintelligible to his fellow of Piedmont, who lives less than one hundred miles away. A Genoese ship's captain can understand his Sicilian sailors, when they are talking familiarly

among themselves, about as well as an English commander of a "Peninsular and Oriental" liner can follow the jabbering of his Lascar crew. Nor can ignorant men from some of the provinces understand the pure Italian. Two classes were recently held in the Episcopal Church of San Salvatore, in Broome Street. New York, to teach Sicilians enough Italian to enable them to use their prayer-book.

The age-long political division of Italy into a number of petty States preserved all differences and inspired

an intense local patriotism; nor did the narrow belfry spirit wholly vanish with the political union of 1870. Relics of it are still found. Ask a Roman peasant if he is an Italian, and he is as likely as not to say "No," that he is a Roman; and so with a Genoese or a Neapolitan. In dislike or indifference toward those from other parts of the country, the Italian abroad usually seeks those of his own city or province. In the same way, little circles of friends are formed in the Italian army and navy. Question a group of sailors on shore leave from an Italian man-of-war, and you will probably find that, with perhaps a single exception, they are all of one place. Ask them how this happens, and they may tell you, as they have told me, laughing: "Friendship is for those from the same fatherland.

These profound dissimilarities make sweeping generalities about Italians impossible. Yet in one point every province is alike. The poor everywhere are all crushed by heavy taxes for maintenance of the large army and navy which make Italy a first-class European power.

THE ORGAN-GRINDER IS NO LONGER OUR REPRESENTATIVE ITALIAN

More serious than the exactions of the tax-gatherer is the long-continued agricultural depression that has reduced a large part of the South to Nor is poverty. this all. The peasant's lot is made infinitely worse by an Irish question that is the blight of nearly all southern Italy, Sicily, and Sardinia. There are the same huge entailedestates and the same lazy, reactionary, and absentee landlords. Throughout large sections great tracts of fertile soil support only one shepherd or one farmer per square

mile. To these idle lands must be added the vast stretches of barren mountains, and the malaria-infested fifth of the entire surface of the peninsula. No new territory has been added to the kingdom, while the population has been increasing within twenty years from twenty-eight and one-half to thirty-two and one-half millions—an average density for the whole country of 301 per square mile. And the excess of births over deaths amounts to nearly 350,000 a year—the population of a province. Through whole districts in this overcrowded land Italians have to choose between emigration and starvation.

A definite economic cause drives the poor *Meridionale* from his home, and a definite economic cause and not a vague migratory instinct brings him to America. He comes because the country has the most urgent need of unskilled labor. This need largely shapes the character of our Italian immigration, and offers immediate work to most of the newcomers. Almost eighty per cent. of them are males; over eighty per cent. are between the ages of fourteen and forty-five; over eighty per cent. are from the southern

provinces, and nearly the same percentage are unskilled laborers. who include a large majority of the illiterates. These categories overlap, so that the bulk of our Italian immigration is composed of ignorant, able-bodied laborers from the South. They come by the hundred thousand, their great numbers are quickly absorbed withdisturbing out either the public peace or the labor market. In spite of the enormous immigration of Italians in 1903 and 1904, the last issue of the United

THE MAN WITH THE SHOVEL IS OUR REPRE-SENTATIVE ITALIAN TO-DAY

States Labor Bulletin shows that the average daily wage of the laborer in the North Atlantic States—the "congested" district at the very gates of Ellis Island-had increased within the year from \$1.33 to And 1904 was not a particularly prosperous year. Equally significant, in view of the unprecedented Italian immigration of the first six months of this year, is the announcement in the last number of the Bulletin of the New York State Department of Labor that the improvement in the conditions of employment has been so marked, and "the proportion of idle wage-earners has diminished so rapidly, that the second quarter of 1905 surpasses that of 1902, the record vear."

The demand of the East for labor is first heard by the new arrival who needs to look for work, and probably a majority of Italian braccianti never go more than a hundred and fifty miles away from New York. Immediate work and high wages, and not a love for the tenement, create our "Little Italies." The great enterprises in progress in and about the city, the subways, tunnels. water-works,

railroad construction, as well as the ordinary building operations, call for a vast army of laborers. For new and remodeled tenements alone. authorized by the Building Department between April and June, 1905. the estimated cost was over \$39,000,000. This gives measure of the demand. A labor leader has furnished another. At a recent conference, arguing that restriction of immigration would benefit American labor, he said that an authority in the building trade had

calculated that with immigration suspended, common labor in New York would be receiving \$3 within a year. He had not calculated the paralysis that such a wage would inflict upon industry.

Of all that come in response to our National invitation to the worker, the educated Italian without a manual trade is the Italian who most signally fails in America. He is seen idling at the cheap restaurants everywhere in the Italian colonies. But the illiterate laborer takes no chances. He usually has definite knowledge of precisely where work is needed before he leaves home. thousand immigrants sometimes reach Ellis Island in a single day. Yet each Italian must earn his living in some way, and that at once, for he brings no more than eight or ten dollars with him.

This same inborn conservatism that risks nothing makes of southern Italians the most mobile supply of labor that this country has ever known. Migratory laborers, who come here to work during eight or nine months of the year, and return between October and December, are a very large part of the annual immi-

They form a stream of workers that ebbs and flows from Italy to America in instant response to demand; and yet the significance of the movement has gone almost entirely unnoticed. than 98,000 Italians—laborers and others. but chiefly laborers—went back to Italy in 1903. In 1904, owing to a temporary lull in our prosperity and the general business uncertainty during a Presidential campaign, the demand slackened. The common laborer, who ordinarily pays a padrone fifty cents as a fee for employment, was offering as high as five dollars for a job in the summer of 1904. In the end, more than 134,000 Italians returned to Italy within the year, and we were saved the problem of an army of unemployed.

If the ignorant immigrant is a menace, the mobility of Italian unskilled labor has conferred another blessing upon us, for it is the very element that contains a large majority of the dreaded illiterates. The whole number of them who enter the community thus gives no indication of the number who are permanently added to our population, and the yearly percentage of their arrivals since 1901 has fallen from 59.1 per cent. to 47 per cent., and is likely to fall still lower. But there is something to be said on behalf of the illiterates who remain among us. They are never Anarchists; they are guiltless of the so-called "black hand" letters. The individual bracciante is, in fact, rarely anything but a gentle and often a rather dull drudge, who still has wit enough to say that he knows he cannot be Cæsar, and is very well content to be plain Neapolitan Knowledge is power, but an Nicola. education gives no certificate of character, and still less does ability to read and write afford any test whatever either of morals or of brains. A concrete instance gives a practical proof. There are more than four times as many illiterates in the general population of the United States as were found, according to the last published report, among those arrested in Greater New York between January 1 and March 31, 1905: 44,014 persons were arrested; of these, only 1,175, or a little over 2.6 per cent., were unable to read or write. The percentage of illiteracy

for the entire United States is 10.6 per cent., and for that of the native whites alone 4.6 per cent.

The very success of American schools goes far in explaining the mystery of our exorbitant demand for unskilled labor. In proportion as they fulfill their mission they are depriving us of the rough la-The boy who is forbidden by the New York law to leave school until he is fourteen years old and has reached the fifth grammar grade, later in life does not join a gang that digs sewers and subways. Such laborers are recruited from the illiterate, or nearly illiterate—those who have failed in the beginning of the struggle in which brains For our future supply of the lower grades of labor we must depend more and more upon countries with a poorer school system than ours.

Lies have short legs, the Florentine tag has it, but the Italian is still accused of being a degenerate, a lazy fellow and a pauper, half a criminal, a present danger and a serious menace to our civilization. If there is a substantial basis of truth in these charges, it must appear very clearly in Greater New York, which is now disputing Rome's place as the third largest Italian city in the world. Moreover, New York contains nearly two-fifths of all the Italians in the United States, and in proportion to its size it is the least prosperous Italian colony in the country, and shelters a considerable part of our immigrant failures—those who cannot fall into step with the march of American life.

First, as to the paupers. The Italian inhabitants of New York City number nearly 450,000; the Irish, somewhat over 300.000. In males—the criminal sex the Italians outnumber the Irish about two to one. Yet by a visit to the great almshouse on Blackwell's Island and an examination of the unpublished record for 1904, I found that during that year 1,564 Irish had been admitted, and only 16 Italians. Mr. James Forbes, the chief of the Mendicancy Department of the Charity Organization Society, tells me that he has never seen or heard of an Italian tramp. As for begging, between July 1, 1904, and September 30, 1905, the Mendicancy Police took into custody

519 Irish and only 92 Italians. Pauperism has a close relation with suicide, and of such deaths during the year the record counts 89 Irish and 23 Italians. The Irish have always supplied much more than their share of our paupers; but Irish brawn has contributed its full part to the prosperity of the country; and the comparatively large proportion of Irish inmates in all our penal institutions never justified the charge that the Irish are a criminal race, or Irish immigration undesirable. That was the final answer to the Know-Nothing argument!

Nor do court records show that Italians are the professional criminals they are said to be. Take the city magistrates' reports for the year ending December 31, 1901—the latest date for which all the necessary data are available. At that time, using Dr. Laidlaw's estimate of additions by immigration to the population of the city to May 1, 1902, there were about 282,804 Irish and 200,549 Italians in Greater New York. If the proportion of the sexes remained unchanged from the taking of the census, there were 117,599 Irish males, and 114,673 Italian. This near equality of the criminal sex in the two

SIGNOR ANTONIO FRANCOLINI President of the New York Italian Savings Bank, prominent in reform movements and philanthropy

REPRESENTATIVE ITALIAN

nationalities makes possible a rough measure of Italian criminality.

In these columns of crime the most striking fact in the Italian's favor is a remarkable showing of sobriety. During the year, 7,281 Irish were haled into court accused of "intoxication" and "intoxication and disorderly conduct," while the Italians arrested on the same charge numbered only 513. With the exception of the Russian Jews, Italians are by far the most sober of all nationalities in New York, including the native born. Next, noticing only offenses committed with particular frequency, the Italians again appear at a pronounced advantage in: Assaults (misdemeanor), 284 Irish and 139 Italians; disorderly conduct, 3,278 Irish and 1,454 Italians; larceny (misdemeanor), 297 Irish and 174 Italians; vagrancy, 1,031 Irish and 80 Insanity is here listed with Italians. crime, and there are 146 Irish commitments to 35 Italian. Irish and Italians are nearly at an equality in: Burglaries, 63 Irish and 57 Italians; and larceny (felony), 122 Irish and 94 Italians. the other hand, Italians show at the worst in: Violation of corporation ordinance (chiefly peddling without a license),

SELF-MADE MEN

196 Irish and 1,169 Italians; and assault (felony), 75 Irish and 155 Italians. In homicides, quite contrary to the popular impression, the Italians are only charged with the ratio exactly normal to their numbers after taking the average per 100,000 for the whole city, while the Irish are accused of nearly two and one-half times their quota: Irish 50, Italians 14. The report for 1903, the last published, after important changes effected by almost two years of immigration, shows an unchanged proportional variation: Irish 59, Italians 21.

The one serious crime to which Italians are prone more than other men is an unpremeditated crime of violence. is mostly charged, and probably with entire justice, upon the men of four provinces, and Girgenti in Sicily is particularly specified. It is generally the outcome of quarrels among themselves, prompted by jealousy and suspected The Sicilians' code of honor treachery. is an antiquated and repellent one, but even his vendetta is less ruthless than the Kentucky mountaineer's. It stops at the grave. Judged in the mass, Italians are peaceable, as they are law-abiding. The exceptions make up the national criminal record; and as there is a French or English type of criminal, so there is a Sicilian type, who has succeeded in impressing our imaginations with some fear and terror.

The Mafia is the expression of Sicilian criminality, and here, as in Italy, the methods of the Sicilian criminal are the same. For some of his crimes he is more apt to have an accomplice than most other criminals. But there is no sufficient reason for believing that a Mafia, organized as it often is in Italy, a definite society of the lawless, exists anywhere in this country. No one who knows the different Italian colonies well will admit the possibility of its existence. The authorities at police headquarters scout the idea. As with the Mafia, so with the Black Hand. I went to Sergeant Petrosino, who is said to know every important Italian criminal in New York. He disposed very summarily of the bogey: "As far as they can be traced, threatening letters are generally a hoax; some of them are attempts at blackmail by inexperienced criminals, who have had the idea suggested to them by reading about the Black Hand in the sensational papers; but the num-

ber of threatening letters sent with the deliberate intention of using violence as a last resort to extort money is ridiculously small."

It is important that two or three other truths about the Italian should be known. Like all their immigrant predecessors, Italians profess no special cult of soap and water; and here, too, there are differences, for some Italians are cleaner than others. Still, cleanliness is the rule and dirt the exception. The inspectors of the New York Tenement-House Department report that the tenements in the Italian quarters are in the best condition of all, and that they are infinitely cleaner than those in the Jewish and Irish districts. And the same with overcrowding. One of New York's typical "Little Italies" is inhabited by 1,075 Italian families—so poor that only twenty-six of them pay over \$19 monthly rent-and yet, when a complete canvass was made by the Federation of Churches, the average allotment of space was found to be one room to 1.7 persons. Like the Germans and Irish of the fifties, our Italians are largely poor, ignorant peasants when they come to us. But by the enforcement of the recent law our present immigrants are greatly superior physically and morally to those of the Know-Nothing days. The difference in criminal records is partly the proof of a better law. The worst of the newer tenements are better than the best of the old kind, and every surrounding is more sanitary. Better schools, recreation piers, public baths, playgrounds, and new parks are helping the Italian children of the tenements to develop into healthy and useful men and women.

To understand our Italians we need to get close enough to them to see that they are of the same human pasta—to use their word—as the rest of us. Thev need no defense but the truth. In spite of the diverse character that all the provinces stamp upon their children, our southern Italian immigrants still have many qualities in common. peculiar defects and vices have been exaggerated until the popular notion of the Italian represents the truth in about the same way that the London stage Yankee hits off the average American. Besides,

as the Italian Poor Richard says, "It's a bad wool that can't be dyed," and our Italians have their virtues, too, which should be better known. Many of them are, it is true, ignorant, and clannish, and conservative. Their humility and lack of self-reliance are often discouraging. Many think that a smooth and diplomatic falsehood is better than an uncivil truth. and, by a paradox, a liar is not necessarily either a physical or a moral coward. No force can make them give evidence against one another. Generally they have little orderliness, small civic sense, and no instinctive faith in the law. of them are hot-blooded and quick to avenge an injury, but the very large majority are gentle, kindly, and as mild-They are docile, tempered as oxen. patient, faithful. They have great physical vigor, and are the hardest and best laborers we have ever had, if we are to believe the universal testimony of their employers. Many are well-mannered and quick-witted; all are severely logical. As a class they are emotional, imaginative, fond of music and art. They are honest. saving, industrious, temperate, and so exceptionally moral that two years ago the Secretary of the Italian Chamber of Commerce in San Francisco was able to boast that the police of that city had never yet found an Italian woman of evil character. Even in New York (and I have my information from Mr. Forbes, of the Charity Organization Society) Italian prostitution was entirely unknown until by our corrupt police it was colonized as scientifically as a culture of bacteria made by a biologist; and to-day it is less proportionately than that of any other nationality within the limits of the greater city. More than 750,000 Italian immigrants have come to us within the last four years, and during that entire time only a single woman of them has been ordered deported charged with prostitution.

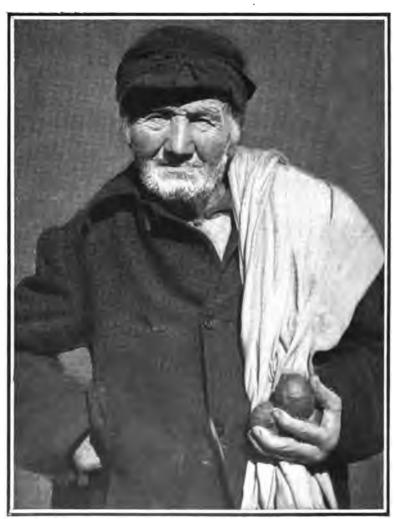

So far from being a scum of Italy's paupers and criminals, our Italian immigrants are the very flower of her peasantry. They bring healthy bodies and a prodigious will to work. They have an intense love for their fatherland, and a fondness for old customs; and both are deepened by the hostility they

meet and the gloom of the tenements that they are forced to inhabit. The sunshine, the simplicity, the happiness of the old outdoor ways are gone, and often you will hear the words, "Non c'é piacere nella vita"—there is no pleasure in life here. But yet they come, driven

preservation of the Italian spirit and tradition.

But there are limits to the building of an Italian city on American soil. New York tenement-houses are not adapted to life as it is organized in the hill villages of Italy, and a change has come over

A LEMON PEDDLER FROM CAMPO BASSO

from a land of starvation to a land of plenty. Each year about one-third of the great host of industrial recruits from Italy, breaking up as it lands into little groups of twos and threes, and invading the tenements almost unnoticed, settles in the different colonies of New York. This is a mighty, silent influence for the every relation of life. The crowded living is strange and depressing; instead of work accompanied by song in orangeries and vineyards, there is silent toil in the cañons of a city street; instead of the splendid and expostulating carabiniere there is the rough force of the New York policeman to represent authority.

There is the diminished importance of the church, and, in spite of their set ways, there is different eating and drinking, sleeping and waking. A different life breeds different habits, and different habits with American surroundings effect a radical change in the man. It is difficult for the American to realize this. He sees that the signs and posters of the colony are all in Italian; he hears the newsboys cry "Progresso," "Araldo," "Bolletino;" he hears peddlers shout out in their various dialects the names of strange-looking vegetables and fish. The whole district seems so Italianized and cut off from the general American life that it might as well be one of the ancient walled towns of the Apennines. He thinks that he is transported to Italy, and moralizes over the "unchanging colony." But the greenhorn from Fiumefreddo is in another world. Everything is strange to him; and I have repeatedly heard Italians say that for a long time after landing they could not distinguish between an Italian who had been here four or five years and a native American.

Refractory though the grown-up immigrant may often be to the spirit of our Republic, the children almost immediately become Americans. The boy takes no interest in "Mora," a guessing match played with the fingers, or "Boccie," a kind of bowls—his father's favorite games. Like any other American boy, he plays marbles, "I spy the wolf," and, when there is no policeman about, baseball. Little girls skip the rope to the calling of "Pepper, salt, mustard, vinegar." The "Lunga Tela" is forgotten, and our equivalent, "London bridge is falling down," and "All around the mulberry-bush," sound through the streets of the colony on summer evenings. You are struck with the deep significance of such a sight if you walk on Mott Street, where certainly more than half of the men and women who crowd every block can speak no English at all, and see, as I have seen, a full dozen of small girls, not more than five or six years old, marching along, hand in hand, singing their kindergarten song, "My little sister lost her shoe." Through these children the

common school is leavening the whole mass, and an old story is being retold.

Like the Italians, the Irish and the Germans had to meet distrust and abuse when they came to do the work of the rough day-laborer. The terrors and excesses of Native Americanism and Know-Nothingism came and went, but the prejudice remained. Yet the Irish and Germans furnished good raw material for citizenship, and quickly responded to American influences. They dug cellars and carried bricks and mortar; they sewered, graded, and paved the streets and built the railroads. slowly the number of skilled mechanics among them increased. Many acquired a competence and took a position of some dignity in the community, and Irish and Germans moved up a little in the social scale. They were held in greater respect when, in the dark days of the Civil War, we saw that they yielded to none in self-sacrificing devotion to the country. Thousands of Germans fought for the Union besides those who served under Sigel. Thousands of Irishmen died for the cause besides those of the "Old Sixty-ninth." "Dutch" and "Mick" began to go out of fashion as nicknames, and the seventies had not passed before it was often said among the common people that mixed marriages between Germans or Irish and natives were usually happy marriages.

From the very bottom, Italians are climbing up the same rungs of the same social and industrial ladder. But it is still a secret that they are being gradually turned into Americans; and, for all its evils, the city colony is a wonderful help in the process. The close contact of American surroundings eventually destroys the foreign life and spirit, and of this New York gives proof. Only two poor fragments remain of the numerous important German and Irish colonies that were flourishing in the city twenty-five or thirty years ago; while the ancient settled Pennsylvania Dutch, thanks to their isolation, are not yet fully merged in the great citizen body. And so, in the city colony, Italians are becoming Americans. Legions of them, who never intended to remain here when they landed, have cast in their lot

A GROUP OF SCHOOL CHILDREN, ALL ITALIANS
"Through these children the common school is leavening the whole mass"

definitely with us; and those who have already become Americanized, but no others, are beginning to intermarry with our people. The mass of them are still laborers, toiling like ants in adding to the wealth of the country; but thousands are succeeding in many branches of trade and manufacture. The names of Italians engaged in business in the United States fill a special directory of over five hundred pages. Their real estate holdings and bank deposits aggregate enormous totals. Their second generation is already crowding into all the professions, and we have Italian teachers, dentists, architects, engineers, doctors, lawyers, and judges.

But more important than any material success is their loyalty to the nation of their adoption. Yet with this goes an undying love for their native land. There are many types of these new citizens. I have in mind an Italian banker who will serve for one. His Americanism is enthusiastic and breezily Western. He has paid many visits to the land of his birth, and delights in its music, art, and literature. He finds an almost sacred inspiration in the glories of its Beginning in extreme poverty, history. by his own unaided efforts he has secured education and wealth; by his - and State in which services

he lives he has won public esteem. Perhaps no other Italian has achieved so brilliant a success. But as a citizen he is no more typical or hopeful an example of the Italian who becomes an American than Giovanni Aloi, a street-sweeper of my acquaintance.

This honest spazzino of the white uniform sent a son to Cuba in the Spanish War; boasts that he has not missed a vote in fifteen years; in his humble way did valiant service in his political club against the "boss" of New York during the last campaign. And yet he declares that we have no meats or vegetables with "the flavor or substance" of those in the old country; reproaches us severely for having "no place which is such a pleasure to see as Naples," and swears by "Torqua-ato Ta-ass" as the greatest of poets, though he only knows four lines of the Gerusalemme. by side over the fireplace in his livingroom are two unframed pictures tacked to the wall. Little paper flags of the two countries are crossed over each. One is a chromo of Garibaldi in his red shirt. The other is a newspaper supplement portrait of Lincoln.

A man like Giovanni Aloi, yearning for the home of his youth, sometimes goes back to Italy, but he soon returns. Unconsciously, in his very inmost being,

prophecy of Bayard Taylor's great ode is fulfilled. Their tongue melts in ours.

he has become an American, and the Their race unites to the strength of ours. For many thousands of them their Italy now lies by the western brine.

Brother, thy mouth is darkness
Devouring me.

I rush at the whirl of thy bidding;
I pour and spend
Through the wheel-pit's nether tempest.
Brother, the end?
Before fierce days of tent and javelin,
Before the cloudy kings of Ur,
Before the Breath upon the waters,
My splendors were.

Red hurricanes of roving worlds,
Huge wallow of the uncharted Sea,
The formless births of fluid stars,
Remember me.
A glacial dawn, the smoke of rainbows,

The swiftness of the canoned west, The steadfast column of white volcanoes, Leap from my breast.

But now, subterranean, mirthless,
I tug and strain.

Beating out a dance thou hast taught me
With penstock, cylinder, vane.

I am more delicate than moonlight,
Grave as the thunder's rocking brow;
I am genesis, revelation,
Yet less than thou.

By this I adjure thee, brother, Beware to offend! For the least, the dumbfounded, the conquered, Shall judge in the end.

THE TURBINE TALKED TO THE MAN
AT THE SWITCHBOARD'S CRYPTIC KEY:
Brother, thy touch is whirlwind
Consuming me.

I revolve at the pulse of thy finger.

Millions of power I flash

For the muted and ceaseless cables

And the engine's crash.

Like Samson, fettered, blindfolded,

I sweat at my craft;

But I build a temple I know not,

Driver and ring and shaft.

Wheat-field and tunnel and furnace, They tremble and are aware. But beyond thou compellest me, brother,
Beyond these, where?
Singing like sunrise on battle,
I travail as hills that bow;
I am wind and fire of prophecy,
Yet less than thou.

By this I adjure thee, brother, Be slow to offend! For the least, the blindfolded, the conquered, Shall judge in the end.

THE MAN STROVE WITH HIS MAKER
AT THE CLANG OF THE POWER-HOUSE DOOR:
Lord, Lord, Thou art unsearchable,
Troubling me sore.

I have thrust my spade to the caverns;
I have yoked the cataract;
I have counted the steps of the planets.
What thing have I lacked?
I am come to a goodly country,
Where, putting my hand to the plow,
I have not considered the lilies.
Am I less than Thou?

THE MAKER SPAKE WITH THE MAN
AT THE TERMINAL-HOUSE OF THE LINE:
For delight wouldst thou have desolation,
O brother mine,
And flaunt on the highway of nations
A byword and sign?

Have I fashioned thee then in my image
And quickened thy spirit of old,
If thou spoil my garments of wonder
For a handful of gold?
I wrought for thy glittering possession
The waterfall's glorious lust;
It is genesis, revelation,—
Wilt thou grind it to dust?

Niagara, the genius of freedom,
A creature for base command!
Thy soul is the pottage thou sellest:
Withhold thy hand.
Or take him and bind him and make him
A magnificent slave if thou must—
But remember that beauty is treasure
And gold is dust.

Yea, thou, returned to the fertile ground
In the humble days to be,
Shalt learn that he who slays a splendor
Has murdered Me.
By this I adjure thee, brother,
Beware to offend!
For the least, the extinguished, the conquered,
Shall judge in the end.

A WOMAN'S IMPRESSIONS OF THE PHILIPPINES

BY MABEL T. BOARDMAN

Miss Mabel Boardman was a prominent member of the party of Government officials and others under the charge of Secretary Taft which visited the Philippines last summer. In response to a request from The Outlook for a woman's impressions of the Philippines, Miss Boardman has written the following account of her observations there. Miss Boardman is a resident of Washington, and has been active and efficient in the reorganization of the American National Red Cross.—The Editors.

To find so far in the East, with such Oriental surroundings, a city like Manila, with its many traces of Western civilization, convinces any one who stops to think, that in the Philippines exist conditions which are not to be found in the neighboring countries. It is true that in the ports of China and Japan many of the streets and houses may have European aspects, but this is entirely due to the encroachments of Western commerce.

As we drove from the dock on the Pasig River, where we landed on Saturday morning, August 5, up through the streets of the old walled city to the Ayuntamiento, the Government building, I was immediately impressed with the Spanish appearance of the houses, the convents, and the churches that we passed. The light-colored two or three storied buildings, some with overhanging galleries, were a marked contrast to the long rows of low, black houses that line so many of the streets of Tokyo. After the jinrikishas we had seen in Japan, and the chairs we were to use in China and Korea, the scores of little native carriages, with occasionally a large victoria of some American or foreign resident that rattled along beside us, brought again a sense of European civilization. An attempt was once made to introduce jinrikishas into the islands, but the Filipinos were so opposed to their fellow-men being transformed into beasts of burden that it had to be abandoned.

Spanish again is the fine Government building, the Ayuntamiento, which fronts on the Plaza McKinley, and crowded was its great marble hall with Filipinos

and Americans when we arrived. the dais sat the Governor-General of the Islands, the Philippine Commission, and the Secretary of War. Behind them on the wall hung high the portraits of Presidents McKinley and Roosevelt, and in close juxtaposition, on carved wooden medallions, were the heads of the Spanish Queen-mother and the little boy-All that such a scene typified aroused in me, and I think in many others, a new and intense emotion. First the soil of that mysterious East, then the foundation of Spanish Christian civilization; and now, what manner of structure are we, the American people, to build thereon?

Here, at this meeting of welcome, the freedom of the city was presented to the Secretary of War by the Mayor of Manila; and I noticed there, as on other like occasions, the eager interest with which the Philippine people of all classes listened to the speeches. These had always to be translated either into Spanish or into English, so that even brief addresses became somewhat lengthy affairs; but the standing crowds at the sides and back of the room never thinned, nor did the eyes of the listeners turn away from the speakers. How many of them comprehended the import of what was said? How many listened, as children will listen, to a story they do not understand? These are questions I cannot answer, for nowhere did we come in such touch with the tao, the man of the people, as to have an opportunity to learn his point of view. But is it probable that he differs from the great majority of the rest of mankind, contented if he has enough to live comfortably according to his

wants, and discontented if conditions are otherwise?

After the welcome at the Ayuntamiento we were driven to the houses of the various hosts, most of them being American officials. There had apparently been some friction between the Americans and the Filipinos in regard to the entertainment of the Commission. On the one hand, we were told that the Filipinos had not shown any energetic anxiety to entertain the party, and that when asked what nights should be reserved for any of their hospitality few responses were received, so that the Americans took the matter in hand and planned many dinners, receptions, and other entertainments. The other side of the story, for there was another side, was not so easily to be learned. To a people brought up on the mañana principle the direct and energetic questions, "Whom will you entertain?" or "What evenings do you wish for a dinner or a ball?" are much too startling for a prompt response. Furthermore, inquiries had been made as to whether or not Chinese cooks, those cordons bleus of the East, were kept, or horses and carriages for their guests' convenience. These questions had made them hesitate to proffer such hospitality as they felt they were able to offer. The few members of the Commission who did stay in Philippine families could have re ceived no greater kindness and hospitality than were shown them by their hosts.

Monday was the day of the great civic, industrial, and military parade. After a shower or two came a bright, sunny day, the temperature no higher than an average summer day at home, though the humidity takes the starch out of one's energy as well as one's clothes. For two hours or more the procession passed-regiments of United States soldiers, native constabulary, thousands of school-children, floats representing municipal and governmental departments, the various trades and manufactures, the manual training school, and bands by the score. Bands before and after everything! and at one time, when nothing more could be found to precede and follow, they preceded and followed each other, marching happily along, fourteen strong, each

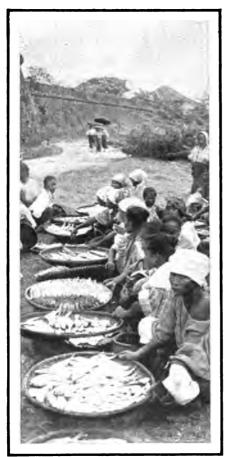

serenely playing a different tune. And finally came the end, the fire department of the past, an ancient and for once subdued Filipino pony dragging slowly a small water-cart, beside which walked a dozen men carrying pails. Then, like whirlwinds from the high bridge up the street, came tearing down and thundering by, one after the other, the great American fire-engines—the East and the West again.

But if we try to rush our Western ideas into the stolidity of the East with the same chariot-race speed, we may learn that patience is a greater virtue in the Oriental march of human progress than a superfluity of American "hustling." It was all very interesting, but the sight that had left the deepest impression was that of the thousands of school-children marching along under the American flag. With them rests the future of their country.

One morning the Secretary, Miss Roosevelt, and some of the rest of us gave to a visit to the Manual Training School-now full of pupils-and to the Normal School. The young Philippine woman at the head of the girls' dormitory of the latter school told me that among those girls, many of whom speak different tongues, English is now used as the general language. After a tour of inspection we found about two hundred of the Normal School young men and women assembled in a large hall. Watching the faces as the Secretary spoke to them most earnestly of their great responsibilities—no interpreter was needed, so well did they understand English—I noticed among the young men one or two whose expressions seemed to warn us of days of future mistaken patriotism on their part, but the majority of them looked happy and contented. The faces of the young women were especially bright and responsive. other morning Miss Roosevelt and four or five other women of the Commission's party went to a meeting of the Women's. Club, whose President, Miss Felix, read a well-written paper in Spanish on "The Philippine Woman, Past and Present," a translation of which was afterwards given by one of the American teachers. A women's club in the tropical Orient,

in the midst of the Eastern subjugation of women—what a flavor of the West!

A Philippine entertainment came at last—a musicale in a private house. We drove through a small garden, and under a porte-cochère. A broad stairway led from the lower hall to the main hall above, where we were received by Señor and Señora Limjah. Off from this hall,

FROM STEREOGRAPH, COPYRIGHT, 1908, BY UNDERWOOD & UNDERWOOD
THE FISH MARKET AT MANILA

as is usual in these houses, opened the various rooms of the house, including most of the bedrooms, and in the hall the musicale was held. The Philippine people are exceedingly fond of music, but it seemed to me their playing and their singing lacked expression.

Fortunately, that evening I had the opportunity of meeting a number of Philippine women.

Only a very few of them spoke English, and my conversation was somewhat restricted by the limitations of those who did. There was a certain pathos in a remark one of them made: "We have talked and talked for months of your coming, and when you do come we have seen so little of you. Now you go away so soon you cannot come to see us in our homes."

Saturday night, at the Ayuntamiento, a ball was given by the Filipinos for Miss Roosevelt. Here, as at all other balls, came again the West with its social life. Waltzes and two-steps were danced, and a square dance called the rigadon. This Miss Roosevelt and some of us had learned on the steamer, tutored by the Secretary and some young Philippine fellow-voyagers, so that we could dance it without being reduced to the hopeless confusion that generally ends our own lancers. A sympathy in pleasures and amusements goes a long way in cementing a friendship.

Sunday we sailed away from Manila on the transport Logan for a two weeks' tour of the islands, and on Tuesday morning our first stop, Iloilo, on the island of Panay, brought us into the heart of the sugar-growing country. We ran up the river in a procession of little boats to near the municipal building, in whose upper hall were assembled a number of the ladies of the town to welcome us, brave in their mestizo dresses and many diamonds in spite of the early morning hour.

In the afternoon carriages were provided for a sugar-mill visit and a tour of the surrounding country. It fell to my fortunate lot to be taken on this drive by a young Miss Lacson, daughter of a prominent sugar-planter of Occidental Miss Lacson, having been educated in a Hongkong convent, spoke both French and English. We tagged on behind the long procession of army wagons in a small victoria drawn by a pair of diminutive ponies, whose erratic actions occasionally snapped some part of the harness. The readiness with which the driver produced string to repair damages, and the absolute unconcern of my companion, proved the commonness of such experiences, and

PLOWING A RICE-FIELD WITH A WATER BUFFALO

reminded me of Mr. Kipling's description of his departure after a visit to some Indian rajah, when he drove away in a victoria "which the horses dragged by a few pieces of string and the grace of God." As the army wagons held together better than did we, we were soon left behind, and thus escaped the sugarmill, visiting instead a fine old Spanish-In the lower hall or court stood house. an array of family carriages. The walls and doors of the large upper hall and salon were of beautiful old carved mahogany, and especially attractive were the delicate arches that separated the rooms from the gallery that surrounded The outer sides of this gallery consisted mainly of the great sliding windows that opened towards a picturesque but unkempt plaza. Not content with the ancient splendor, the good dame of the house had draped the beautiful mahogany walls with festoons of crinkled flower-printed paper in honor of this festive occasion, and the tables of the salon were filled with rolls of jusi, left there in hopes of a sale. The house swarmed with children, Señora Jalandones having nine of her own, and, with their patriarchal way of living, cousins innumerable seemed to be part of the household.

My little companion, Miss Lacson, was most eager to have the tariff on Philippine sugar removed, so I gladly presented her to several of the Senators and Representatives. It is to be hoped that her gentle plea in broken English, "Please take off the sugar Dingley tariff, then I can have a little money to go to Washington to thank the Senators and Representatives for helping us here," will not be without results.

While we were walking through the picturesque old cathedral of Jara she slipped away from my side and knelt for a moment before the shrine of a transept chapel. How could one doubt the nature of that silent little prayer that the Blessed Virgin would soften the hearts of the Senators from the beet and sugar growing States!

At the banquet in the evening the tables formed the letters I L O I L O.

IN THE SUBURBS OF MANILA

1906

The menu, as at all other banquets, was that of a European dinner, save that such fruits as mangoes, lanzones, chicos, etc., were unfamiliar to the most of us. Philippine women appear very fond of fruits and sweets, and the orderly course of a menu is not always to their liking, so that I was not surprised to see some of my neighbors at table partake of fruit or cake whenever the fancy seized them, rising up from their chairs to reach for some distant sweetmeat. If I glanced in their direction, it was immediately interpreted as a like desire, and a hospitable hand was promptly extended to deposit beside my plate a share from the plundered dish. Affairs were not prosperous in the sugar-growing provinces, and the resulting discontent showed itself in several of the speeches; but have not hard times in our own country had a tendency to arouse dissatisfaction with the party in control and a desire for a change of administration?

The trip next day in small coast boats across to Bacolod on the island of Negros was not undertaken by many of the

women, as there was a chance of rough water. Even the small coast boats could not go within a mile or two of the shore. and we were transferred to a most remarkable raft of bamboo, constructed for the occasion, with an elaborately decorated pavilion top. While the men were listening to sugar hearings, we went for a drive, escorted by the Governor's wife, whose victoria boasted two pink satincovered pillows. At the Governor's home were assembled a number of the ladies of the town, one or two of whom spoke a little English, and we were ushered into a salon where most of them were seated in two long rows of chairs that were placed facing each other down the center of the room, and here we were entertained by a small girl of ten at the piano, and then by a young woman who recited a Spanish speech of welcome in which we were called "the fair flowers of America." I felt then, as at other times, that in spite of our Anglo-Saxon smile over the flowery Spanish metaphor we ought to appreciate the spirit back of it.

On our drive to the large pavilion

A FILIPINO HOME AND RICE-FIELD ON THE ISLAND OF CEBU

built for the banquet near the quaint old Spanish church our driver and the ponies had the usual differences of opinion, in which, as usual, the ponies came off victorious, so that, in spite of a few mild remonstrances from the Governor's wife and many hopeless efforts on the part of our native jehu, we drove several times round the plaza before the ponies con- FROM A PHOTOGRAPH BY BURR M'INTORH sented to stop at the pavilion in the cen-

A DATTO

Here the many expected speeches had to be cut out because of the lateness of the hour, and, as every Filipino is an orator, many a disappointed Demosthenes or Cicero must have gone home with bitterness in his heart against the men of the West who had spent so many hours in the morning gathering facts that they had no time left for eloquence. However, it is deeds, not words, that count, and to talk of independence to a people in no way fitted for such freedom can only do harm; but to lower or abolish the tariff on their products will be of practical benefit to them and prove an honest desire to aid in their progress and prosperity.

Onward to the south we sailed from Iloilo, leaving the complex problems of the Filipinos for the more pictures que and less perplexing questions of the Moro country. Here is more virgin soilrocky perhaps, but not so sown with weeds and tares, and simpler in the cultivation. Around us, as we lay off the pretty harbor of Zamboango, swarmed the small native canoes with their broad out-

riggers extending on either side.

The native constabulary, in khaki, barefooted, and on their head that sign of the Moslem, the fez, lined the dock where we landed, and on the pretty parade-ground of the post, bordered by rows of palms, were scores of prominent dattos brilliant in their many-hued costumes, of which red was the predominating color. Many of them, accompanied by their parasol-bearers and betel-nut carriers, were presented by Colonel Mans to Miss Roosevelt, and one old datto, as he gazed at the slight, girlish figure carrying her own parasol, inquired, with some suspicion, "Is that

FROM A PHOTOGRAPH BY BURR M'INTER

NATIVE CONSTABULARY

the one?" Governor Finley, the military Governor of the province, has established a Moro exchange to encourage them in peaceful pursuits, and there we bought mainly bolos, trusting that by so doing we might indirectly assist in this effort to " beat their swords plowshares into and their spears into pruning-hooks." Watching the sale of a bolo, one of the Moros, standing by, volunteered the advice to the purchaser to buy a rough-hilted one, as the handle of smooth silver became slippery as soon as covered with blood -a counsel that thought might easily have come from one of our own red men at home.

Sulu or Jolo, like Zamboanga, has a most picturesque harbor. There we were entertained by Moro sports of a primitive nature. Back of the stand

on which we sat stretched a most beautiful tropical scene, a view of greensward under groves of cocoanut-trees, dotted with bright-colored Moro groups, and the blue sea with its scattered islands glistening beyond in the sunlight.

In the Moro country no question of social equality vexes conditions, and though at the dance at the Army Club the stout little Sultan in a uniform resplendent with gold lace, and many of the dattos in their native dress, were present, yet, save when presenting Miss Roosevelt with a Moro saddle, a bolo, or a baroque pearl, they sat in a little group

A MORO SPEARMAN

near the door gazing with mild interest upon the dancers.

Except for a day's excursion through a rice-growing country from Manila to San Fernando, our only interior view of any of the islands was in Mindanao. where we crossed a narrow neck of land from Malabang on the south to Camp Overton on north. The narrow road wandered up much of the way through a forest jungle, great ropes of vines binding the unfamiliar trees and enormous ferns together like huge twisted serpents. Here and there. swinging in the branches, we caught glimpses of some bold monkey that our advance guard of cavalry had not frightened away. Only once did we pass a cluster of little native grass houses, and hardly a Moro was met on the way, yet we had a largeguard, for the

jungle presses close on the roadway, and could easily shelter any unfriendly datto whose bolo thirsted for prey. The black volcanic soil through which the road was often cut holds promises of great future wealth when the island is developed, and on the rolling plains around Camp Vickars and Camp Keithley it produced a dense growth of grass eight or ten feet high. Leaving the wagons beyond Camp Vickars late in the afternoon, we climbed down a mile or two of steep and muddy trail to the beautiful Lake Lanao. All around it were the mountains fading away under a black storm-cloud in the

FROM A STEREOGRAPH, COPYRIGHT, 1905, BY UNDERWOOD & UNDERWOOD

PRIMARY PUPILS IN THE MUNICIPAL SCHOOL AT MANILA

distance, and down to its very borders crept the forest. Clusters of cocoanuttrees with little groups of grass huts were scattered along the eighteen miles of shore by which we sailed before night and the storm shut down upon us. Camp Keithley was reached in a deluge of tropical rain, and we shivered under our mackintoshes with a thermometer not up to seventy that August evening.

We stayed with the officers' families in their little houses of bamboo and grass, and when in the morning the light shone in through the chinks in the outer walls of our room, and we pushed up with long poles the thatching that hung down over the glassless windows, Miss Roosevelt and I felt ourselves in quite a Robinson Crusoe atmosphere. There was hardly time before we left in the morning for a glimpse on our side of the camp of the beautiful lake still under the

haze of early dawn, and, on the other, of the distant sea. Eighteen miles of road led down to Camp Overton, twelve of which no vocabulary can be found to describe—mud to the horses' knees, ruts to the hubs of the wheels, and miles of bamboo corduroy that consisted mainly of holes.

On Cebu the rice crop had been damaged by an early drought, and back of the decorations, parade, banquet, and ball there was some discontent of a political nature and some real suffering from lack of food. Illness had followed in the wake of famine, and two American women had established a small hospital for the sick women and children—a hospital without any nurses except themselves, and with such medical attendance as they could secure. The expenses of this hospital of fifty or more patients, and the feeding of three or

FROM A STEREOGRAPH, COPYRIGHT, 1906, BY UNDERWOOD & UNDERWOOD

A CLASS IN THE NORMAL HIGH SCHOOL AT MANILA

four hundred other persons, had cost only about ten dollars a day. Twenty thousand doctors, I was told in Manila, are needed throughout the islands, and it is fortunate that a number of young Filipinos, who are studying in the United States, intend to pursue that profession.

To reach Taclogan we had a most beautiful sail on small coast boats through the picturesque, river-like Straits of San Juanico, often not a third of a mile broad, which separate the islands of Samar and Leyte. Conditions were different here. We were in the hemp-growing provinces, and with prosperity came contentment that manifested itself in the speeches, and the hope was expressed by some that the Philippines might one day be a new star on the flag of the United States.

Albay, whose seaport is Legaspi, and Sorsogon, being likewise in the hemp

country, were prosperous, and so there also we found contentment. As we sailed that early morning up to Legaspi, who that saw it still unveiled by clouds can ever forget that wonderful volcano of Mayon, rising a perfect cone nearly nine thousand feet out of the sea? Could it borrow from Fuji the white cap of snow, it would outrival in loveliness and grandeur that famous volcano of Japan.

Our last three days in Manila the Secretary of War, Miss Roosevelt, and I spent as the guests of Señor Benito Legarda, one of the three Philippine members of the Civil Government Commission. The house was as large and generous in its proportions as the hospitality we received there. The broad stairway led into a great square hall in front of which was an equally spacious salon, and off of the hall and salon

opened the bedrooms. At the end of an extended part of the hall stretched the dining-room, the width of the house, that could easily have held twoscore or more of dinner guests. The house of the Philippine gentleman is apparently the house of his friends, for all day long the great hall was occupied, the men sitting by the open windows disposing of one long cigar after another, while occasionally some one drifted to the grand piano, or a special group disappeared into the Secretary's room to discuss Philippine conditions.

After the return to Manila the Commission devoted a day to a hearing of the malcontents, who desired immediate independence; one among them stating that if this was granted they would do away with all taxation. Upon being questioned by a member of Congress as to how he could support the government, he promptly replied that that was a mere detail he had not yet considered. A sufficient answer, it seemed to me, as to the Filipinos' present fitness for self-government.

On Thursday, August thirty-first, I, for one, reluctantly sailed away from the Philippines. We had seen much, yet all too little, of these intensely interesting islands.

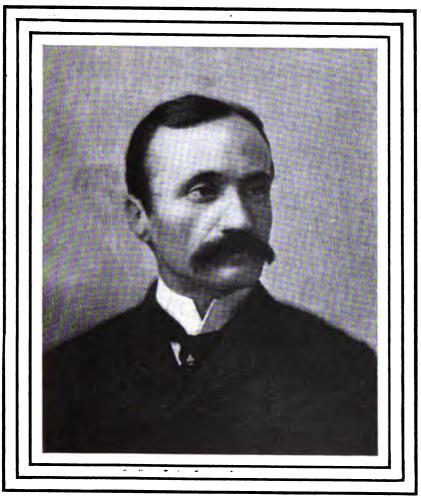

And what of final impressions? I can speak only for myself. The problem is a great one, but therefore the more interesting, the more worthy of a great people, and, if it is eventually solved, Manila will prove to the United States as valuable as Hongkong is to England, and the rich soil of the Philippines will

bring back to us in manifold returns the bread now cast upon its waters. He who goes out to the islands in official capacity must study conditions not only from the American's but also from the Filipino's point of view, if he would understand and deal justly with this people. The man whom President Mc-Kinley appointed the first Civil Governor of the islands set the highest example of what a colonial official should be—strong but sympathetic, progressive yet patient; and to-day no one has so great an influence with the people there, because of their trust and confidence in him.

The small social courtesies mean much more to a race educated under Spanish tutelage than to the Anglo Saxon, and in such matters our American women can play an all-important part if they will. The Philippine women are sensitive, but quickly and warmly responsive to a true courtesy that is without condescension.

There rests an equally grave duty to the Philippines upon certain of our officials and legislators here at home—a duty of the strong towards the weak. To give them independence now would be as great a crime as to turn a child out into a winter night. Rather out of our plenty let us grant them a little by such wise legislation as will aid their productions and increase their prosperity.

For my part, I do not think the question is whether or not the problem can be solved, but whether or not we are capable of rising to the high plane of patience, sympathy, and unselfishness that such a solution requires.

ARRIGO BOITO

ARRIGO BOITO, POET AND COMPOSER

BY DR. ENRICO FONDI

HAVE just met Boito again. As always, his giant figure was a bit curved. He was clad in a black suit. His face was clean-shaven, save for his gray-sprinkled mustache, becoming more and more like his whiter hair. His blue eyes were as expressive as ever, and under his stiff hat his head gently moved with the movement of his body.

Boito is doubtless the greatest living Italian musician. He is so, first, because he is the most erudite as well as the most inspired of present-day Italian composers, and, second, because he is also a poet, pure and simple. Like some of the ancients, he unites in himself two departments of art. But, it may be added, Boito represents another double asset,

that of race. He is the son of an Italian, the Cavaliere Silvestro Boito, and of a Pole, the Countess Giuseppina Rodolinska. Born in 1842, in Padua, Arrigo Boito has always given some evidence of this double racial nature, Latin and Slav. He knows how to be as ardent as a vagabond of the steppes and as calm as a pagan philosopher. From this union emanates the double essence of his art. With his Slav blood he can keenly appreciate northern poetry, with its peculiar romantic characteristics, the cavalcades of specters, the languishing virgins, the dæmonic angels (images which, after 1815, also invaded Italian literature), together with the crunching of the bones of the dead, the sighs and tears of countless mourners, the grimaces of the demented, and the delirium of the fevered, all marking a grotesque passion in poetic imagination. This kind of romanticism, this distortion of vision, this dolorous antithesis of life, did not have its Italian poet, par excellence, until after 1860, and then he appeared in the person of Arrigo Boito. With this late comer all these romantic ingredients were by no means mere incumbrances and rubbish, as they had been with many other European poets; with him they became a living force because they found a sympathetic and truly appreciative interpreter. In him the romantic form, however, is quite the contrary from that which had distinguished the so-called Italian romanticists; his is far more completely worked out and concentrated, as it is also fuller of imagery and sensation. He has been Italy's one latter-day romantic poet, even if he did appear a long time after our so-called romanticists, those who bore in reality, however, only the mask of romanticism.

His poetic genius had a precocious development. Among his lyrics the masterpiece is the fable of King Bear, in which the narration borrows much theatrical make-up from old-time romanticism (dwarfs, headsmen, enslaved Hebrew maidens, cruel princesses, troubadours, devils masquerading as monks, serpents, hyenas, wolves, lapwings, the mixture of wedding scenes with serenades by enamored poets, with apparition flights, with banquets, with burials—and all this in

very varied form which hides harmonious verse, a verse which now dances, now trembles, now lulls us, now even terrifies us. King Bear represents Evil, not that of manhood, but that of mere angry Nature, the Evil represented by ferocious wild beasts, by atmospheric storms, by oceans in tempests, by volcanoes in eruption. Opposed to Evil stands the Worm, death. We thus are in the presence of poetic symbols such as popular fantasy creates, or, in accord with it, the fantasy of a sympathetic artist. Boito's lyrics arouse in us a real sense of musical emotion. The tragico-humoristic "vision of King Bear " was followed by the very original "Dualism," "The Mummy," "The Merry Mothers"—composed with his friend the poet Emilio Praga-and the libretto of "Hamlet," written for another friend, Franco Faccio, the composer.

From that time to the present Boito's literary work, known by his name or by that of the clever anagram, Tobia Gorrio, or given forth anonymously, was chiefly that of the libretto-the necessary transformation for the Italian lyrical stage of the texts of "Rienzi," "Tristan and Isolde," a version of Wagner's songs, "Hero and Leander" (put into music first by himself, and then, destroying his notes, given to his friend Bottesini and then to Mancinelli) (1879), "La Gioconda " for Ponchielli (1884), " Othello " (1885) and "Falstaff" (1893) for Verdi, not to mention a "Pierluigi Farnese" for Palumbo, a "Zoroaster," "Iran," and "Eclogues" for Coronaro, and "The Sickle " for Catalani.

Before the composition of "Mephistopheles "--" Mefistofele " in Italian-the union of Boito's poetic and musical activity is represented by "The Fourth of June" (1860) and "The Sisters of Italy" (1861); but they represent also a collaboration with Faccio, Boito's companion at the Milan Conservatory. These achievements were presented at the closing exercises of the scholastic term at the Conservatory; they gained for each student the sum of two thousand francs, with which the young Italians were able to make a foreign tour. They visited Germany and France. At Paris they presented a letter of introduction to Verdi, which had been given to them by the Countess Clara Maffei. From this dated the memorable friendship of Boito with the great master—a friendship so fecund for the art of music as interpreted by Verdi that Boito produced the words for the elder composer's "Hymn to the Nation," "Simone Boccanegra," "Othello," and "Falstaff." These libretti make us regret that our poet Boito had not been born two decades earlier in order that he might have united his worth-while co-operation with Verdi's For Boito's libretti are true works of art. Wherever delicacy of thought is allied to sincerity of sentiment, wherever the supreme law of rhythm dominates all, wrapping ideas and actions in a sweetly sonorous wave, Boito's libretti are to be mentioned. Moreover, I would say that, as we have noted with Boito's lyrics, they arouse in us a sense of true musical emotion. The composer has been an efficacious reformer of the libretto; he has brought new life to it.

Up to the present the only work of poetry and music which exhibits to us Boito's entire soul is "Mefistofele," created when Boito was but twenty-six years old, and now one of the corner-stones of the Italian stage. Having returned from the Garibaldi expedition of 1866, Boito devoted himself to the completion of this work, words and music. It is certain that the words cost him the greater labor, and also cost him a characteristic and more tormenting hesitation than did the music. Gounod had contented himself with taking a simple, amorous episode from Goethe's "Faust." But Boito, following a more comprehensive plan, condensed the poem, admirably coloring it, into six pictures, and with such a clearness that with a glance we are all able to understand them. This is the first reason for the superiority of "Mefistofele," which was first produced at the Scala, at Milan, on the 5th of March. Alas that one must chronicle its 1868. memorable failure! It is true that the Prologue and the Scene in Greece were applauded, but these were alone exempt from the tempest of howl. the third representation of "Mefistofele" the noise was so deafening that Faust could not even hear the orchestra, and hence was unable to sing in tune. The

orchestra was directed by Boito himself —tall, thin, pale, fair, imperturbable, and serene as a statue which would await from the future its consecration of glory. At the close some friends, with the principal men of the orchestra, pressed about him, congratulating and embracing him. The bitterest polemical discussion arose, however, in which all Milan took part. It lasted several days, and even caused duels. No work of art ever aroused such a warlike spirit, I believe. newspapers called Boito's music "not music at all, but pedantry," and called Boito himself "a blockhead." Let it be added, however, parenthetically, that Beethoven's famous "Kreutzer Sonata" was dubbed by a Leipsic paper "all that is most grotesque."

Beyond anything, the public could not pardon Boito the frankness with which he had shown himself to be an innovator. At that time it would not admit as worth while anything new since Rossini, Donizetti, Bellini, with the exception of Verdi; and if this was true in general, in particular was it true that the public deemed it unpatriotic to accept any reforming influence which an Italian, with such antecedents as Boito's, might draw from foreigners. With these sentiments, on the first night of "Mefistofele," many went to the theater armed with huge keys with which to make the utmost hissing and noise. A crowd of men in the adjoining Caffé Martini awaited the result, and rejoiced, as for a piece of national good fortune, when they knew that the opera had been hissed.

Times and tastes soon changed. On October 4, 1875, "Mefistofele" came back to the stage and appeared at the Teatro Comunale of Bologna—that noble city which, first of all in Italy, opened wide her gates to "Lohengrin" and the art of Wagner. Thenceforth "Mefistofele" never left the Italian stage. thusiasm which it awakened spread to the Milanese, who in 1881 changed their first judgment. But his failure in Milan in 1868 had taught Boito to have some regard to certain exigencies of the theater; he had recast the orchestration of "Mefistofele:" he had eliminated an entire act and also a symphonic intermezzo; but he had

added certain other features, among them the exquisite serenade of "Sabba classica." As has justly been said. " Mefistofele " cannot be called an opera in the sense that its predecessors were operas, because it is constructed on new ideas, gigantically ample in form and outline; because it represents a thoroughly modern treatment, whether we consider rhythm, harmony, melody, or instrumentation. "Mefistofele comes to us as a grandiose conception, the revelation of a vast prospect, created by a new and audacious apostle of the divine art of sound, who sees the world in his own way, and thinks, musically, as few have thought before him.

For over thirty years Boito has been working on another opera, "Nero," or, in the Italian, "Nerone." Taking into consideration the permanent success of "Mefistofele," no one doubts that "Nerone" will be the consummate work of art of Boito's later years, crystallizing

his maturer experiences.

To the many accusations from the public that Boito has not produced enough, he is accustomed to reply, "You accuse me of indolence and of little love for work. Very well. Let me tell you that 'Nerone' has fully occupied many years of assiduous labor. Why, I have not had time even to write a symphony."

It is true that Boito might seem averse to work were we only to see him of an evening when, with his friends at the Caffé Savini, he is amusing himself with his pet diversion of solving the various puzzle problems printed in the papers. This passion comes, I think, from Boito's fancy for the strange, the hidden, the esoteric. One notes it in his verses, which are often bizarre in rhythm, have queer conceptions, eccentric meters, and words of double significance. Boito's thought, whether expressed by sound or by the printed word, was born in him complex and profound. Before he gives it birth, it passes through a minute work of revision. This probably accounts for the delay in the production of "Nerone," continually remade and re-fused. Such is Boito's fastidious criticism when applied to himself that I should not be surprised to learn of his displeasure at having published "Mefistofele" at all, so great would be his delight in retouching it, and perhaps remaking it from beginning to end.

Another impression of sloth is given by Boito, unconsciously, because he is apt to receive one in dressing-gown and slippers. Moreover, he never lets you suspect what he has done and what he is doing. He is entirely unostentatious. He has many decorations, Italian and foreign, but he always hides them.

In 1893, together with the composer Saint-Saëns, he was made Doctor of Music by the University of Cambridge.

Boito has long lived in Milan, in the Via Principe Amedeo, No. 1. reception-room is furnished in gray, but his workroom is specially inundated with sunlight. Like Goethe, Boito adores the There is little furniture—a piano. of course, on which the works of his "divine John Sebastian Bach" are apt to rest; a high writing-desk, where the composer must stand to write; then another writing-desk, which is also a safe for the treasure produced by his brain. On the bookshelves may be seen Boito's favorites in prominent array—the Bible, Dante, Petrarch, Tacitus, Horace, Rabelais. Among the portraits bearing dedicatory inscriptions which hang on the wall one notes those of Rossini, Verdi, and Wagner. Finally, four large figures in statuary look down upon the Italian composer—those of Dante, Raphael, Bach, and Beethoven. In their varied spirits, meditative and interpretative, these giants of art seem to watch over the genius of our latter-day giant; they are there to greet the coming of that masterpieee of Boito for which the beginning of the twentieth century is waiting.

TARRY AT HOME TRAVELS

BY EDWARD EVERETT HALE

"My mind impels me to write on places where I have been and on some of the people whom I have seen in them"

SEVENTH PAPER

New York

THIS series of papers began in the counsels of Mr. and Mrs. Gentle Reader. As it happens, they end in the same counsels.

They go to bed at 9:30. It was now five minutes before nine. He had just been reading to her Mr. Hale's paper about Connecticut in The Outlook. She said, "The trouble about Mr. Hale is that he always supposes that other people can do what he does. He has been at the top of Katahdin and at the top of Mount Washington and at the top of Mansfield and at the top of Wachusett. He has been on Ingham Peak in Rhode Island and on West Rock in Connecticut, and so he writes as if I had been there or as if we could go there as easily as we can go to bed."

"Well," said Mr. Reader in reply, "I do not see why he should not say so. You and I are younger than he is, and we have this very summer before us. What do you want to do most?"

She said that she should forget everything that she had been told about New England, and that she wanted something like what her old schoolmistress called a "review." She would like to take that review, and at the same time she would like to see something in her tarry at home travels which had not been described or represented in The Outlook.

"Very good," said he. "Mr. Hale begins by saying that New England is a peninsula with an isthmus not two miles wide at its western end. How should you like to go round by Bar Harbor and the end of Nova Scotia, see the Bells at Baddeck, and then go down to the Gulf of St. Lawrence, and make a call at one of Grenfell's hospitals at Newfoundland, take the steamer up to Montreal, and then go by rail to St. John's above the Lake; there meet Ransom with our house-boat, and so go by the house-boat near Burgoyne's line to Saratoga? You shall arrive at Saratoga on the day of the anniversary of the battle of Benning-I, meanwhile, will have my canoe painted. The day you start I will start, and I will go down the Connecticut and then paddle along the Sound from Saybrook to New York and put the canoe on the deck of the steamer which shall take me to Albany. Then I will paddle up to Cohoes and make a carry at the falls there, and so, on the eleventh of August, I will get on the house-boat and I will find you all there. And at the spot where General Gates received General Burgoyne's sword, I will fold you in my arms and kiss you, and after that you will remember that New England is a peninsula and that you and I have stood on the neck which separates it from the mainland."

These words were spoken in their bungalow near Windsor on the Connecticut River.

To all she agreed. Now you must know that they were at the omnipotent

THE BATTLE OF SARATOGA
From an old print

This age is any age between fourteen and ninety-five, if only you be pure of mind, peaceable, and easy to be entreated. For then you can use omnipotent power if you want to. In this particular case these young people had been married twelve years. He did not drink, nor smoke, nor play at poker or other games of chance. He had no yacht, and he disliked the stock market. loved him and her children. Her French and German were better than his. They lived in the open air every moment when they could escape "those prisons which we call homes." So they were always a little beforehand. He was always surprised that his bank balance was a few hundred dollars better than he thought it would be. She was constantly finding that her dividends from the Green Consolidated were larger than she expected they would be. On this occasion they parted from each other for nearly three weeks' time—the longest parting they had ever known. He told Ransom to have the house-boat well scoured out, painted where the paint was worn, he gave him the money to buy two mules with, told him he was to have the houseboat at Whitehall on the sixth of August.

She told old Ruah, who had had charge of the children ever since Nathan was born, that she was to put the children on the house-boat at Albany, and that Ransom would take them all to St. John's. Then she wrote Gertrude Ingham, the same who had been her literature teacher at Vassar College, and asked her to make the voyage to Nova Scotia, Baddeck, Newfoundland, and the St. Lawrence with her. Gertrude said she would come up and join her.

Meanwhile, Mr. Reader had done as he He had given orders to John Tintoretto, the Italian who presided over such things up the river, to paint the canoe, he had sent down to Cocknell's for three paddles—one long one and two short ones. He had provisioned the canoe for a short voyage down the Connecticut River and through the Sound, and on the fatal Monday which the gods provided, they started on their way. You see, when they had this talk of which you have heard, at nine o'clock in the evening, it was about the time when the days were the longest. Before July was well advanced all these preparations had been made of which you have been told.

¹ Ruah is short for Lo-ruhamah.

So she went to White River Junction, and they rattled across the country to Portland, with their Outlooks in their They refreshed the memory of hands. Maine and New Hampshire as well as you can from an express train. They went to Bar Harbor by the Flying Yankee. They did not miss one connection at the New Brunswick St. John, or at Halifax, or at Baddeck. At Baddeck they saw some of Mr. Bell's wonderful kites at Le Bras d'Or, which is the name of that great shore loch where a bath is so charming. By means known to residents of that region, they went across to the Newfoundland St. John. and then by great good luck they joined Miss Merciful as she was taking round some supplies to a hospital in Anticosti. Fortune favors the brave, and the Strathcona came along, and carried them from that ship to another on the north side of the river, and then there was a Government steamer to go that very afternoon up the St. Lawrence to Quebec, and of course it happened that Dr. Abernethy was on board, to whom Dr. Grenfell had given them a letter.

When you are at Quebec, everything is easy sailing to Montreal. I do not know which of these young women is the better traveler. I know they always light on their feet. They always see whatever

GENERAL JOHN BURGOYNE.

BARON FRIEDRICH ADOLF RIEDESEL

there is to be seen, and it does not surprise me, therefore, that on the appointed day and hour, as old Ransom stood on the front of the house-boat, scolding and advising and keeping an eye on all the children and instructing dear old Ruah on the points where she was doubtful, Gertrude and Abra looked out each from her own window of the cab which took them from the Prince Royal at Whitehall down to the canal. Great was the joy, as you may imagine. children had been more than a fortnight parted from their mother. Ransom had nothing but success to announce. Dear old Ruah, with worthy pride, said she had not had to give anybody any medicine, and that they had been good boys and girls, all of them. Abra and Gertrude went round to see the mules, patted them and praised them. Without so much as turning the boat around, the mules were taken round on the tow-path and attached to the other end of the boat. The cabman was paid, with a shilling extra to buy candy for his babies, and before they were ten minutes older the reunited party were going south on the Champlain Canal, where the children had but just now, under Ransom's auspices, been traveling to the north. So they found the way ready for them, and so the mules, well pleased, led them step by step from "blue Champlain." Old Ransom sometimes, when they were

coming to a lock, let the boy Nathan run along with him on the shore finding wild roses and pond lilies for his mother.

Meanwhile, Mr. Reader had taken his own coat-box in his hand out to the express office, had given his instructions at the post-office, where he found Tintoretto, and walked down to the river, rolled up his duster and tucked it under the front seat of the canoe, had bidden Timothy in the water, keeping her head to the south if the river flowed south, and east when it flowed east, and west when it flowed west. There were places where he could run in under the shade, but not many such places now. There were one or two long reaches where he had to paddle if he meant to keep up a good average day's work. Sometimes at nightfall he padlocked the canoe to a convenient post and walked up into the

DE WITT CLINTON
From an engraving after the bas-relief by W. J. Coffee

good-by, and pulled out into the Connecticut.

"1905," he said to himself; "it was in 1774 that John Ledyard floated down here from Dresden College, as he would have called Dartmouth College. That was the beginning of the Nile and Congo for him."

And for a little relief he stretched himself out in the boat, with one paddle

town. He did this at Springfield and at Hartford. But five times out of six he found some trees, where he could roll himself in a blanket and let the sun and morning birds waken him. At New York the Mary Powell people were glad to take him and the Water Witch on board, and as the passengers came down he met the Birdsells and the Havilands and the Schuylers and a dozen other of the

pleasantest people of the world, and they were early enough to pick out good front chairs on the upper deck, and so a very happy day was provided for.

At Albany he went up to see what there was left of dear Hunt's picture of Anahita: he uncovered his head reverently before the noble statue of Robert Burns; he wondered how that man in the public garden makes his lotuses and nymphæas grow so much better than his own do. He called on Mrs. McElroy, who told him good news, and an hour before nightfall he walked down to the landing to find that the Water Witch was ready for him. And then, under the strokes of his own paddle as he worked his way up the river, he should arrive quite on time to see the only house-boat on the Champlain Canal and to wave his handkerchief and to jump on board.

It is not part of this series of papers to give local direction to travelers, which they can obtain much more to the present point by the local guides and the local guide-books. Enough to say that he gave Abra the kisses which he had promised, that she did not refuse. Enough to say that he made the little boy ride with him from one of the streams which flows into the North River across to one of those which flows into Lake Champlain. Nathan is an intelligent little fellow who has lived in the open air, and was made to understand that this was the isthmus of the peninsula of New England.

They spent a whole day in going over the Burgoyne battle-grounds with a clever local guide, who had provided Baroness Riedesel's journal, and they read again her pathetic letters. He told them the story of the mysterious third Nathan Hale and perhaps mythical Nathan Hale. He made Nathan commit to memory, so that he could declaim it to his mother when they came home, the lines about the "great surrender," how the Brunswick colors

Gayly had circled half the world
Until they drooped, disgraced and furled,
That day the Hampshire line
Stood to its arms at dress parade,
Beneath the Stars and Stripes arrayed,
And Massachusetts Pine,
To see the great atonement made
By Riedesel and Burgoyne.

You see he tried to make the boy understand that the battles at Saratoga are among Colonel Creasy's "Fifteen Decisive Battles of the World." The reader may go back in these papers to see what is said about this in the chapter on Vermont. Nathan, who understands a map, pointed out to him that the battles of Bennington were fought on the New York side of the Vermont line.

Possibly some enthusiastic German-American will write me a line to say just what the Brunswick colors and the Hessian colors were which were "furled" at Saratoga. We want replicas of those colors badly in the Old South Meeting-House in Boston, which is our museum of such things. But somehow no one in Frankfurt seems eager to send them to

(In a parenthesis let me ask if you happen to know how the Rothschild fortune began. It was when one Napoleon was driving the Elector of Hesse out of his palace, and the Elector had some ready money by him. He found a young Jewish banker and placed this money in his hands at a very low rate of interest. It happened that the Jewish banker had no opportunity to return it till the Elector came back in 1814, and on the profits on that silver money the Rothschild fortunes were already well begun. Now, if you please, that silver money which the Elector had in hand was the identical store of shillings and half-crowns which one George III. had paid this gentleman for the troops who were killed at Red Bank, who surrendered at Bennington and again at Saratoga, and who spent the rest of the war as prisoners of war in Virginia. Perhaps the House of Rothschild some day will be grateful enough for this acorn from which grew a great tree, to endow a university for the study of the metaphysics of war, in one of the Old Thirteen States. Saratoga would be a good place for it. There could be a long vacation in July and August, when visitors could reside in the college dormitories.)

No American will go to see the battlegrounds of Saratoga or the place of the capitulation made by Burgoyne without remembering that, a hundred years after, a great American soldier died at Mount McGregor. Yes, and if any one wants to spend more time than our young friends did, here is the McGregor House, and hard by Saratoga Springs, and not far away is Ballston.

I wish we could make room and had a right to print here the diary of Miss Edes, a pretty Boston girl who came to Ballston about a century ago with a great-uncle or somebody who was good to her; and she danced and perhaps joined in the flirtations of the infant watering-place. Recollect that "Ballston Spa" was a fashionable wateringplace before Saratoga was. Ballston Spa, I think, is still the county seat. Not to go into geology or paleontology, for the present is more than we can handle, it will be enough to say that the different wells and springs both at Ballston and Saratoga to-day are what one may properly call bilge-water of the early world. Fortunately for us of this time, the waters of that day settled in some sort of underground lake at the bottom, and so we are able now to drink water like what the megalosaurus or the Carnegiesaurus and other creatures of those early formations drank. People who are oldfashioned enough to read the "Last of

the Mohicans" and the "Pioneers" will find some nice allusions which Cooper made to the early outpour of the springs.

But Mr. and Mrs. Reader and the children had not time to study the geology or paleontology while they were in that region, and a day more saw them in their comfortable home, the house-boat, on their way to Niagara. They were quite careless whether the journey should last fifteen days or five-and-twenty days. In the open air, with God's sky overhead and all the time there is, and the good long days of August, and their own good company, with cardinal-flowers and pondlilies, not to say an occasional sacred bean or water-chinquapin, there was enough to make a good large life of it, even if they did not pick up the morning newspaper.

Nine out of ten of the readers of these lines have no acquaintance with the house-boat but that which they got from Mr. Black's charming story of such a journey as this in England. But there are still left in America some of our old canals of the last century, where one can get away from cinders and smoke and dust, and have the comforts of his home and the joys of open air life very

THE ERIE CANAL AT LOCKPORT
From an old print

closely knit in with each other. One of the very best of such opportunities is that given on the Erie Canal.

I have done my level best in the last few years to place the name of De Witt Clinton among the names of the American heroes in the New York University. I am sorry to say that the New Yorkers themselves hardly seem to be aware that there was such a man; but all the same there was. De Witt Clinton, of the great house of Clinton, one of the two great houses that fought each other in the early politics of the State of New York, was the leader of what was the Democratic party, which in those days was called the Republican party. In 1801 he became Senator of the United States. He left the Senate to be Mayor of the city of New York, was removed and reappointed in 1811, and continued Mayor till 1815. He took up early in life the policy of canal construction between the Hudson and Lake Erie and Lake Champlain. In 1817 a bill was passed authorizing the work at the expense of the State. In the same year he was chosen Governor, and in 1825 he had the "felicity of being borne from Buffalo to Albany in a barge, on the

great work with which his name is identified."

With the construction of the Erie Canal the development of the States then called the Northwestern States, which are now the great Middle States of the country, became possible. The success of that canal was an incentive in every American State to what used to be called "internal improvement." For these reasons I should have been glad if the honor, for it is an honor, of a place among the heroes of America in the Hall of Fame could have been awarded to De Witt Clinton.

The valley of the Mohawk gives a line so convenient that the suggestion of a canal was made very early. There is a story, undoubtedly authentic, of Washington, who knew from his boyhood the lake country to the west, predicting a canal soon after the establishment of the Constitution. Between the Hudson River and the Lakes the highest summit which is surmounted by the lockage of the canal is 688 feet above the sea. The height of Lake Erie above the Hudson is 568 feet. There is the whole flow of the water eastward from the lakes, calculated, I think, on a plan of a

THE ERIE CANAL AT THE LITTLE FALLS, MOHAWK RIVER From an old print

moderate descent of half an inch in a mile. I believe the engineers to this hour think that the original construction reflected great honor on those self-taught engineers who were engaged in that work. They managed to build it for seven million dollars—an investment repaid to the State again and again and yet again by the wealth, not to be calculated, which has made the city of New York what it is and the State of New York what it is.

Of course the cargoes which move from the West to the East on the canalboats are much more bulky than those which pass from the East to the West. A dollar's worth of grain takes much more room and weighs more than a dollar's worth of jackknives. Of course, also, it takes longer for a barge-load of grain to float from Buffalo to Albany under the propulsion of some meditative mules than a car-load on a railway which travels by night as well as by day, with one of the giants of modern times leading the train. All the same, the transfer of the food of the West to the breakfasttables of the East by the canal is very cheap, and the canal holds its own in face of railway competition. So you and I, dear Reader, if we live on a seaport, ought to be thankful for it that it settles for us a good many of the questions as to the cost of freight.

This is certain, that whoever prays for his daily bread in the morning owes a good deal to De Witt Clinton and his followers, as the years go by. In December, 1815, a barrel of flour of the best brand cost anybody in Boston nine dollars. The best flour he can buy now costs five dollars and twenty-five cents. We owe the difference to the Erie Canal. One goes nowadays from Albany to Buffalo at the rate of fifty or sixty miles an hour. When the passenger service was well organized on the Erie Canal, the passenger boats went by day and night, and achieved eighty-five miles in twenty-four hours, on an average. But the traveler of to-day does not begin with Cohoes Falls. He does not see where Sam Patch made his celebrated leap, he certainly does not gather the sacred bean of India, nor does his little boy run along on the tow-path, and, if he capture a frog small enough, jump on board the boat with it and make mamma put it in her thimble. Such are the joys of such travelers as Mr. and Mrs. Gentle Reader. They do not, however, make eighty-five miles in the twentyfour hours, nor do they pretend to.

Dear Innocents, they had all the time there is. This is the phrase which Red Jacket used and which Mr. Emerson used to quote with so much humor. If anybody wants to know who Red Jacket was, he was an Iroquois Chief on the line of this same canal. And if anybody wants to know when he was, let him go ask my dear sister Julia Ward Howe, who told me that when she was six years old her mother introduced her to Red Jacket in his home. No, no, no, Abra and her husband were in no hurry, the children were in no hurry, nor were the mules in any hurry. From time to time old Ransom affected to be in a hurry, but really he was not in a hurry. I am painfully aware that this reader will not follow their example, but let us hope that he is not in such a hurry that he must cross the State in five hours, must "do" Niagara in five more, and must return to his brownstone house in New York by a night train.

Schenectady? Yes, of course they stopped in Schenectady. They had many pleasant people to see in Schenectady, they had to hear the traditions of Dr. Nott. It was vacation time, so that they could not see all the pleasant people, but they could refresh themselves on the historical centers. They shed the right number of tears over the grave of Miss McCrea; they saw the Glen House or the Saunders House. Reader called it the Glen House and Abra called it the Saunders House. Here are their notes on Schenectady:

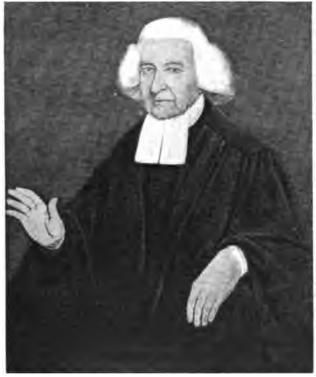

"Have you not read up about the Schenectady massacre? It is high time you did. At all events, you will like to go down to the Saunders house, which stands as a sort of memorial to that massacre, although it was built afterwards. This is the family of the Glen. Perhaps you do not know that Saunders and Glen are the same word. This family of the Glen, I say, were always good to the Indians. They always

had something to eat for the Indian tramp, and they never fooled him by giving him water too hot to wash his hands with. They were nice to him. What happened, then, when the massacre took place was that the Glen family or the Saunders family—have it as you like, though nobody called them Saunders then—were spared, and their house, too, was not destroyed."

"Now, if any student of the higher

"It was exactly as Lafayette had six names he could call upon, and if he did not want to be Lafayette he could be Motier. But you can find the Saunders House if you ask for the Saunders House. If you want memorials of the Glen, you can go over to Glen Falls."

As you go west as they went, or on either of the railways, you can see the pretty "chutes" where the Indians said the sun rolled down as he was approach-

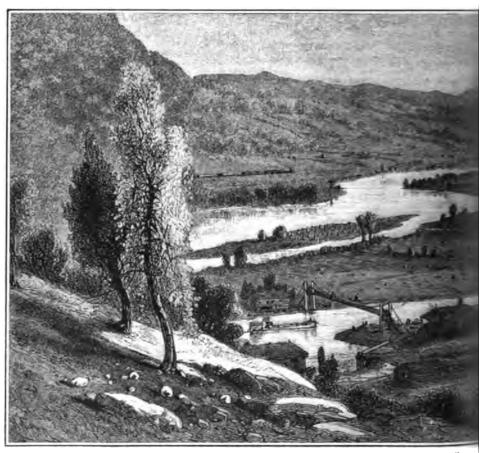

EZRA STILES

criticism wants to know why Saunders are sometimes Glen and Glens are sometimes Saunders, 'let him read,' as Mr. Browning says. Some of these people went down in Louisiana, and one of them, being named Alexander Saunders, used to be called Sandy and Sanderson there, and was then called Saunders of the Glen. When his children and his children's children grew up and came back to Schenectady, some of them thought they were Saunders and some of them thought they were Glens, and they chose their names accordingly."

ing his setting. For the benefit of the New York Observer, I will say that in literal fact the sun does not roll down this mountain side; but there are periods of the year—trust me who have seen it—when the sun hugs the mountain range curiously close, and to the savages, who had not studied with Flamsteed, Langley, or Pickering, it did appear to roll down on that toboggan slide.

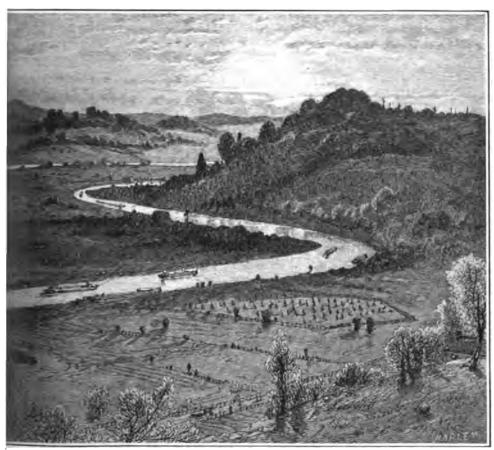

But it would never do to try to tell what they saw, nor will The Outlook care to publish their journal from one end to the other. One thing Mr. Gentle

THE MOHAWK From an old

Reader learned which he had not learned before, though I had often told it to him—he learned how this country is governed by its small cities and its large towns. He learned that in such places as Schenectady and Utica and Syracuse and Batavia and Rochester and Le Roy and Buffalo and a hundred others the public opinion of the town is sound and strong, and that dawned upon him which I had not been able to impress upon him in talking that a great city like New York or Philadelphia or Chicago or Boston has no such control over the real policy of the country as have, in the aggregate, such towns as Akron and Goshen and New Padua and Runnymede, which make the public opinion of Us the People. A man learns this lesson very well as he goes from one end of the State of New York to the

other. I remember I was speaking years ago in the city of New York at a great Alpha Delta Phi convention. I called attention to the fact that a member of the lower house in Albany represents about as many people as a member of the English Parliament represents. Somebody in the audience laughed. I said: "I am sorry that any person The three persons whom I recollect as members of the Legislature of New York would certainly have done honor to any parliamentary assembly in any nation in any period of history since parliamentary institutions took on their present form." The three people whom I had in mind when I spoke were Andrew Dixon White, of Syracuse, Carlton Sprague, of Buffalo, and Theodore Roosevelt, of New York City. I think that twenty years have justified what I

VALLEY cograving

said of those three men. And I am apt to remember this speech of mine and these men when I read in a New York or Boston newspaper about hayseed legislation, with the implication that nobody knows anything unless he lives in the particular town in which the newspaper is printed.

When you go by canal or by the railway, you have a chance to see the oldest work of God which you will ever see on this planet, which I have referred to already in our first number. According to Agassiz and the other men who know, when this world passed into the Paleozoic out of the Eozoic condition—that is, when it passed from the dawn of life to the antiquity of life—certain red-hot rocks showed above the water, with much steam, I fancy, and much hissing. They were the range of ancient rock which divides

the waters of the St. Lawrence from the waters of New England and New York. The railway as it runs west from Schenectady takes its course through this red rock, and Mr. and Mrs. Gentle Reader and the children saw it as the mules traveled along on the pathway of the canal. At Little Falls the boys rushed out to sell them diamonds. These are not of the brand of Golconda or Johannesburg, but they are cheaper, and the children were well pleased to begin their mineralogical cabinet with them.

No! I will not pretend to tell of the various adventures of those happy ten days. I will not tell of messages up to cheerful-looking houses and the return of milk and cream and eggs for the support of man and woman. Then at such places as Ilion or Utica or Rome or Rochester or Batavia, there would be a

walk or a drive through the neighborhood, with every adventure ranging from the simplicity of a canal ride up to the highest civilization. With the nice cordial inmates of other boats Reader and his wife and the children made cordial acquaintances, some of which will ripen into the friendships of half a century. For you must please to understand, dear reader, that the sailor, whom I must not call a seaman, who commands a vessel of three or four hundred tons which makes regular passages backward and forward from New York to Buffalo and perhaps further west, lives on his craft with his family. The boat is their home. Nahum learns from his mother there that B a t spells bat, and Tryphena learns there how to broil a steak and how to bake a potato. If there were a long line of locks together, with so much of business as to keep the travelers half a day, our boys played marbles with other boys of the fleet, or perhaps the girls from the rest of the fleet came aboard the house-boat and played checkers or backgammon.

Are you, alas! as fortunate as they in your vehicle? I am afraid you are riding at sixty miles an hour as you turn this leaf rather impatiently. But all the same there are one or two points which you should notice. Keep on the watch after you pass Schenectady if you are on the northern of the two parallel roads. Even to a flying traveler those black and red rocks seem more hard and cruel than most rocks do, and well they may.

They were what Mr. Sprague saw,

"When the young sun revealed the glorious scene

Where oceans gather And where fields grow green."

Certainly I do not know, and I do not think that anybody else knows, how long was it after the sudden uprising of these silent rocks before the ice-waves from the north, bringing down icy floes and glaciers even, came southward in their flow, lodged for a trifle of a few hundred thousand centuries (be the same more or less) on the north side of the Laurentian Range, and then surmounted it and all other such trifles, and passed southward till they melted away before summer suns? You and I need not bother ourselves

about the length of time. What men know is that these waters which filled the Lake Ontario of that time, the ancestors of the waves which now go down the St. Lawrence so peacefully, were barred by the piles of icebergs in their way, and that they swept across to find the sea by way of the Hudson River. Men know their track by the boulders, and gravelsheets, and bits of sand which they have left behind them. When it was last proposed to enlarge the great Erie Canal, there were people who thought that this old tideway of the very dawn of things might be cleared from its rubbish and made to do our great business of daily bread. If you want to follow out this little bit of prehistoric annals, cross from Utica or Syracuse to Lake Ontario and find some of those intelligent gentlemen there who will give a happy month to you to show the course by which that unnamed river found its way to Manhattan and the sea.

Or, if you have not the month to give to this, go down the bay between Staten Island and Long Island with some intelligent pilot, and he will tell you where is the deep gorge which those old icebergs chiseled out as they worked their way to the Atlantic.

Do not pretend to make your first or your fiftieth visit to Niagara without possessing and studying the directions to travelers prepared in 1903 by the Commission for the Preservation of Niagara. In this very interesting report you will learn much that the average sightseer misses; you will learn things which nobody knew thirty years ago. One or more days may be spent to great advantage in going down the Niagara by trolley. crossing it at its mouth at Kingston, and returning on the other side. Stop over at the station, where a very clever fellow (Yankee clever) will take you down into the gorge where Tom Moore thought how nice it would be

"By the side of you sumach whose red berry dips

In the foam of this streamlet, how sweet to recline,

And to know that I sighed upon innocent lips Which had never been sighed on by any but mine."

This is as good place as any to say that in any collected edition of Moore's

poems the Gentle Reader will find a curious series of "Poems Relating to America." When Moore left Bermuda, "on account of a disorder in the chest," he landed at New York, and by what he called the "Cohos" came to Niagara, and so went down Lake Ontario and the St. Lawrence to Montreal, and Halifax, when he sailed in the frigate Boston for New York. The poem from which I quoted four lines above is a very curious monument of the America of that time. I suppose the Boston, which was an English frigate and not an American frigate, was the same Boston which the poor State of Massachusetts lost to the English in the Penobscot in 1778.

It is quite worth while for any one who has a spark of historical interest to take with him on his house-boat, as he goes from Albany to Buffalo, the journal kept by the girl Fanny Kemble, as she went to the "Falls" for the first time, The journal ends as she sees Niagara for the first time, "O God! who can describe that sight!!!"

There the reader can see how before the days of syndicates men traveled by There was a superstition first that you had to have an inclined plane by which to ascend to a town and another by which you went out of it, as you went out of Albany by an inclined plane. There was another superstition that when you arrived at a town you must leave the train and ride across in a different carriage (technically called a hack) to another railroad. You went from Albany to Schenectady on one, from Schenectady to Utica on another, from Utica to Syracuse on another, from Syracuse to Rochester on another, and from Rochester to Buffalo on another. One must not say it even in a whisper, but it required syndicates to unite these four or five roads into one.

If you will carefully read the Commissioner's direction for visiting Niagara, you will learn about the discussions which have gone on since Lyell's time, and even before, as to the place of the cataract in different ages, as to the different courses by which the waters from the upper lakes pass down through Ontario to the sea. It really seems probable that there was a time when the

upper part of Lake Huron discharged itself by a much shorter channel.

Ah me! I have only brought our adventurous family to the western line of the State, and all southern New York is as yet in the inkstand.

The Outlook is so generous that it permits me to give my little boom to the Erie Canal, which sometimes seems to need a little cordial friendship in its various trials. But we cannot take the happy family back by the same route, for fear that they should be frozen up on the long level east of Rochester. The reader may take any route he chooses. There is the Erie, for instance, which will take him through the classical names. may have his choice from Homer to Ovid or Martial or Painted Post, and he can hardly make a mistake wherever he goes.

Recollect, in general, O Gentle Reader, that New York is the Empire State because it holds this central place between the oldest mountains in the world and the latest Paris fashions as exhibited in New York stores. When you are by Chautauqua Lake, it is a toss of a sixpence whether your cigar end, when you throw it into a brook as you drive, shall go down the Mississippi and enlarge Florida. or the St. Lawrence and feed the dun fish of your next winter's Sunday morning breakfast. Let me say in passing that if you have not spent a week at the annual Chautauqua you do not know your own country. There and in no other place known to me do you meet Baddeck and Newfoundland and Florida and Tiajuana at the same table: and there you are of one heart and one soul with the forty thousand people who will drift in and out there—people all of them who believe in God and in their country.

Further east, whether you are on foot, as I hope you are, or are traveling in Mrs. Diederich Stuyvesant's automobile, as I hope you are not, you will be tempted by each of the Five Finger Lakes, as the geologists call them.

Here lived in happier days the "Five Nations," who became six nations. Here Jemima Wilkinson settled among them, and introduced peaceful arts. O that The Outlook would give me two numbers to tell who Jemima Wilkinson was, who is known to no one of the three million readers of this page.

If by accident any one wants to know how the Five Nations grew up to be one of the gardens of the world, let him read the new life of Jan Huidekoper. He will see here how a young Dutch man, landing when he was twenty years old with twenty dollars in his pocket, lived for six or seven decades and died in his own palace in Crawford County in Pennsylvania, caring in the meanwhile for the Holland Purchase and for other like regions. The biography of one man serves you for a study of a nation.

Rochester? Pray let us stay in Rochester for a day or two, if only to see the beauty of the fruit in August or September or October. Do you know that the Rochester Bank, which was the Flour Bank when Rochester flour was the best flour in the world, is now the Flower Bank, because the Rochester nurseries and gardens challenge the comparison of the world?

Syracuse? We must stop over here if it were only to see Mr. Calthrop and to go out to the model village where they make ready for market the alkalies which are far older than our Laurentian hills.

Utica? We shall have bad luck if we do not strike a convention there. And we must spend three or four years at Ithaca with Mr. White and President Schurman, and talk Browning with Professor Corson. We used to say of Ithaca that there were only young professors there, that they had their reputations to make and were making them. Now that they have made them, it is worth while to recollect that prophecy.

Among all these great names, which appear in every newspaper, I should like to remind the reader, who is very gentle, of what he never heard of, and that is Schoharie Cave. Back from the Catskills, back from Schenectady, back from Sharon, back from everywhere. It is one of those curious limestone caves in which the electric light now shows such wonders. And without going to the Mammoth Cave you may see the underground wonders of the world.

Sharon and Richfield and Saratoga

and Ballston and forty other wateringplaces all offer you their temptations.

The people of New York City themselves do not know the wonders of their system of parks. I am sure I did not know them till a traveler from London, from the Park Commission there, told me how much time it had taken him to examine them, and gave me a hint of how much was before me when I had a month or two for the examination.

Fossils? Yes, fossils if you want them. Lions? Yes, lions if you want them. Here is the very lion which the little Carnegie girl saw in his cage somewhere on the Rhine and asked her father to send to New York. A great English botanist once told me that I could study palm-trees better in the great palm gardens at Kew than if I were in Java or Malacca. I am quite sure that I know more of the habits of the hippopotamus from my observations in the Central Park than do all my bragging traveled friends who have been up the Nile and down half a dozen times.

The Outlook reader will be on the outlook as he tarries at home in his travels for something, be the same more or less, which will show him how man is to be lifted to the higher plane and come nearer to the good God. He will do well, then, if he take the Outlook office as a central point, and if, by the arts of a genial nature and the simple life, he communicate with the officers of the Associated Charities in the same building, he may learn from them more and more of the marvelous charity systems of the city and State. Do not let Argus-eyed Press deceive you here. Argus-eyed Press has a knack of seeing the worst and making the most of it. If John Flaherty knock out his wife's brains with a flatiron, John Flaherty will be the hero of the next nine days. Meanwhile, hour by hour or day by day, week after week, assiduous, tender, Christian charity is working its way up hill and down dale in the great city and in the great State. At the office of the Associated Charities they will show the Gentle Reader how and where to learn what he wants to know of the care which men and women can give to men or women who are in trouble.

And in the organization of public education by steady steps, still advancing, the Empire State of New York has learned what it has to teach to the rest of the civilized States. Here at my side I have the last reports of the University of the State of New York-the One Hundred and Seventeenth Annual Report and the One Hundred and Eighteenth Annual Report. What is called the University of the City of New York is wholly different from that of the State of New York. In the year 1784 the corporation of the Regents of the University of the State of New York was formed by the infant Legislature. It is now a State department and at the same time a federation of more than nineteen hundred institutions of "secondary" and higher education. Its field includes high schools, union free schools, academies, colleges, universities, professional and technical schools, and also the work of education connected with the libraries. study clubs, and extension courses.

To speak of one detail of the supervision which this Board exercises over the higher studies, or home education department, the library department has been a model to the Nation. It is difficult to make people understand that by the lending library system of the State of New York there are now in that State five hundred and twenty-one libraries. with two million three hundred thousand books, circulating annually on an average four hundred issues to each hundred families. The State established a library school which has attained a National reputation. The State Library ranks as second in the country in its equipment.

And so, Gentle Reader, we must part. We have traveled through seven States, and yet we have tarried at home. I did not know you by sight when we began, I do not know you by sight now. But then we were strangers to each other. Now I have that feeling of gratitude to you which none but he who feels it knows—none but a writer. He is used to readers who lay his valuable tractates down to be read on the next Sunday, and then to be forgotten with the dust of three days upon them. You have not treated me thus. If you did, these words would be as blank paper to you.

Seven States we have gone through. They are States which have made their place in the civilization of the world and need not be afraid of their future. When in 1750 dear Ezra Stiles, who was quite competent to this duty, approached the history of one hundred and thirty years of New England, he ventured to prophesy. He had found out how often the population of New England doubled; he supposed that it would double three or four times at the same rate before another century ended in 1850. He was sure that the religion of the Congregational churches was the best in the world. He was sure that the stuff of which Connecticut and Massachusetts were made was the best in the world. and he calculated, therefore, that in 1850 six or seven million of us would be living in the four New England colonies of his day-well, let us own it-that this confederated little Nation would be as well advanced in the world as any of the old Englands or Hollands or France or Spain. He did not conceive it possible that any man in his senses would ever move west of the Hudson River to live. Dear Ezra Stiles, I am afraid that he never pardoned his friend Franklin for establishing himself in Philadel-

It has not turned out just as Ezra Stiles meant it should, but when I go to Tiajuana, and when I spend a Sunday in Vienna, and when I take my coffee in the arbor in the Alhambra, and I run against a compatriot who has one of the New England names or those of their New York cousins, I am apt to find that he is glad to tell me that his forebears eight or nine generations ago came over with Brewster or Winthrop or Davenport or the Scotch-Irish or Knickerbocker or Stuvvesant. I do not find that those who come from the Empire State are ashamed of the Empire State. and I do find that those who have kinsmen in New England are glad that they have kinsmen there.

It has been a pleasure, Gentle Reader, to feel the touch of your hand and to wonder if one of your one hundred and twenty-eight ancestors who arrived in 1630 were, possibly, one of mine.

THE END

CHINA IN TRANSITION

THE CAUSES OF ANTI-FOREIGN FEELING: THE MIXED COURT

BY GEORGE KENNAN

Special Correspondent of The Outlook in the Far East

N order to understand fully and estimate aright the manifestations of anti-foreign feeling which have been so noticeable in China during the past twelve months, and which seem likely to increase in frequency in the near future, the fair-minded investigator should take a few typical cases, such as the boycott, the Hankow-Canton railway concession, and the Shanghai riot, study them carefully, and try to look at the facts from the Chinese point of view. Many Europeans are disposed to regard the attitude of the Chinese toward foreigners as the outcome of Oriental exclusiveness, national self-conceit, and blind racial hatred for which there is no reasonable justification or excuse. They never think of trying to find out what the grievances of the Chinese are, nor do they ever ask themselves, "What should we do, and how should we feel, if all the conditions were reversed-if we were in their places and they were in ours, and if they treated us as we treat them?" On the contrary, they often assume, without investigation, that the Chinese have no real grievances; that they "kick" simply because they are conceited, wrongheaded barbarians who don't know what is good for them; and that even when they seem to have right and justice on their side, no concession should be made to them, because the authority and prestige of the white race must be preserved, and an admission of error or injustice would be regarded as an evidence of weakness, and would only make the "kickers" more presuming, impudent, and dangerous.

Hongkong and Shanghai, as the readers of The Outlook doubtless remember, were both captured by Great Britain in what is known as the "Opium War" of 1839-42. As a result of that war, China was forced to pay an indemnity of \$23,000,000, to cede to Great Britain the island of Hongkong, and to throw open to foreign settlement four or five other seaports, of which Shanghai was It is important to note at the outset that by the terms of the peace treaty Hongkong became an integral part of the British Empire, while Shanghai remained Chinese territory. The Chinese Government gave foreigners the right to live and do business in the latter city, and eventually leased to them there the

This view of the attitude of the Chinese toward foreigners seems to me narrow and one-sided. The Chinaman has faults and vices of various kinds and in great abundance, but he is reasonably patient and tolerant, and if he hates the people whom he regards as pushing, grasping, domineering intruders from the West, he often has good reason to do so, and acts only as we should probably act if we were in his place and were no more advanced than he is in culture and knowledge of the world. An interesting illustration of the way in which he looks at his relations with Westerners is furnished by the recent Shanghai riot—or rather by the trouble in the Mixed Court. of which the riot was the outcome-and inasmuch as the facts throw a good deal of light upon the causes of anti-foreign feeling in the treaty ports, I shall try to set them forth as fairly as I can with the knowledge I have, and to look at them from the Chinese as well as from the foreign point of view.

^{&#}x27;Mr. Kennan's first article in this series, called "The Shanghai Riots," appeared in The Outlook of last week (February 17).—THE EDITORS.

Copyright, 1906, by the Outlook Company

ground on which the International Settlement now stands; but it never parted with its territorial sovereignty in Shanghai as it did in Hongkong, and consequently it still retains there all rights not definitely and specifically surrendered.

As soon as the bounds of the Concession had been agreed upon and marked out, the settlers, who were mostly British merchants, adopted a series of "land regulations" to serve as a sort of constitution, organized a Committee of Roads and Jetties, and proceeded to lay out the new city. As the population gradually increased it became necessary to provide some other form of municipal control than that exercised by the British Consul, and in 1854 the rate-payers elected a Municipal Council, which, with many changes in power and personnel, has governed the city from that time to this. In its present form the Council consists of seven Englishmen, one American, and one German, who are elected annually, for a period of one year, by foreign residents who have the necessary property qualification.1

Up to the time when the Municipal Council was established, the inhabitants of the Concession were all foreignersmostly Englishmen-but after the socalled "Triad Rebellion" in 1854 there was a great deal of crime and disorder in the Yangtse valley, and the Chinese in the vicinity of Shanghai, finding that the International Settlement was a safer place of residence than their own city or any part of the adjacent country, flocked into the Concession by the thousand and began to rent land and houses from the original owners or occupants. This influx of Chinese, which was permitted, but which had not been anticipated, gradually changed a Settlement which was intended to be purely Euro-

pean into a city whose ethnological complexion is almost purely Asiatic.1 the course of a few years the native population increased to twenty thousand or more, and it became necessary to establish some sort of legal tribunal which should have jurisdiction of civil and criminal cases in which Chinese citizens were concerned. In accordance, therefore, with the terms of a treaty entered into by Great Britain and China at Tientsin in 1861, the Chinese Government, acting in conjunction with the British Minister and the British Consul at Shanghai, organized and opened in the International Settlement a "Mixed Court" for the adjudication of all civil and criminal cases in which Chinese were defendants. The "rules" for this Court, which were agreed upon by the Chinese Foreign Office and the British Minister at Peking in April, 1869, have never been legally changed or abrogated. and consequently are still in force. They provide that the Court shall consist of a Chinese magistrate, of a certain specified rank, and a foreign consular officer to be known as an "assessor." In all cases involving the rights or interests of both foreigners and Chinese the consular assessor shall sit with the Chinese magistrate and have concurrent authority and power; but "where Chinese only are concerned the Chinese magistrate shall adjudicate independently—the consuls shall not interfere." 1 The Chinese magistrate, furthermore, is directed and empowered to "provide food and lodging for the prisoners," that is, to keep them in the custody of the Court pending trial and during punishment.8

No one, I think, can read these "Rules," and the Tientsin treaty upon which they are based, without becoming convinced that the Mixed Court was intended to be, primarily, a Chinese tribunal, and that at the time of its establishment Great Britain fully admitted the right of the Chinese to try their own offenders in accordance with

IA citizen who pays taxes on property having a leasehold value of six hundred taels per annum (about \$360 gold) is entitled to a single vote. If the vested interest of a foreigner in the real estate and improvements of the city is greater than this, he may cast votes which, in number, are roughly apportioned to the amount of taxes that he pays, so that a single wealthy individual may cast forty or fifty votes. This sliding scale of property qualification has made the Council a sort of close British corporation, which represents and is responsible to a comparatively small part of the whole taxpaying population. The Chinese residents of the Settlement, although they outnumber the foreigners in the proportion of forty to one, and pay sixty-four per cent. of the general municipal tax, have no representation. have no representation.

¹ Of the 43,339 inhabited dwelling-houses in the International Settlement in September, 1904, the Chinese occupied 42,437 and the foreigners only 902. This does not include the French Concession, which has a separate, independent government of its own, and which is not considered in this article.
¹ Rule 3. Mayer's collection of "Treaties between the Empire of China and Foreign Powers."
² Rule 1, in same volume.

their own laws, and to detain and punish them in their own prisons. This, in fact, was nothing more than common fairness. The International Settlement was still Chinese territory, and if the foreigners living there claimed extraterritoriality for themselves, they were certainly bound to admit the jurisdiction of the native court in cases that concerned only the Chinese.

For a good many years no question was raised as to the status of the Mixed Court, and no attempt was made by the Europeans to modify or control its procedure. The Chinese magistrate adjudicated independently in all Chinese cases, and the foreign assessor interfered only when it was necessary to do so in order to protect some foreign interest. Gradually, however, the Court became the scene of collisions and conflicts of authority, due primarily to a series of persistent attempts on the part of the Municipal Council and the British consular assessor to limit or usurp the power of the Chinese magistrate. The "Rules" expressly prohibited the interference of foreign consular officers in Chinese cases; but, for one reason or another, they did interfere, and in 1901 they declared the "Rules" obsolete, and boldly assumed the right to sit with the Chinese magistrate and share his power in all cases, no matter whether foreign interests were involved or not.1 Then the Municipal Council began to station its own European police officers in the court-room to watch the proceedings and report. The Chinese magistrate retaliated by sending one of his own constables to watch the proceedings in the police court of the British municipality. Finally, the Council built a jail of its own and proceeded to deprive the Mixed Court of the custody of its Chinese prisoners. From the Chinese point of view, as well as from the view-point

of international law, all of these encroachments were illegal; but the members of the Council, and in some cases the foreign consuls and assessors, defended and justified them by declaring that the Chinese magistrate was corrupt and venal; that Chinese criminals arrested by the municipal police and turned over to the Mixed Court were often set at liberty upon payment of a bribe; that the punishments inflicted were sometimes inadequate and sometimes cruel: that the Chinese jail was not a fit place of detention for human beings; and that the procedure of the Mixed Court, generally, was not to be tolerated in a civilized community. I have no doubt that, in the main, these statements were true. "Squeezing," bribe-taking, and the sale of privileges and exemptions by officials are almost universal in China, and the magistrates and "runners" of the Mixed Court probably robbed litigants, sold justice—or injustice—to the highest bidder, and, for a suitable consideration, liberated criminals who ought to have been punished. Such things were done everywhere else in China, and of course they were done in Shanghai. There is no doubt, furthermore, that, as the Chinese population of the city grew from 20,000 to 350,000, and as the Mixed Court became a more and more important part of the machinery of government, the unreformed and often corrupt and barbarous methods of that Court became more and more obnoxious to the Council and the Consular Body. The chief sufferers, it is true, were the Chinese themselves, but the foreigners who governed Shanghai had Western conceptions of justice and humanity, and they were not disposed to tolerate corruption and cruelty within the limits of their own Settlement, even though the victims were Chinese. Actuated, therefore, partly by motives which were good, and partly by the pride of conscious superiority which the Westerner always feels when he comes into contact with the Chinese, the members of the Municipal Council, in their dealings with the Mixed Court, adopted a policy of benevolent interference which had no sanction of law, and which irritated and exasperated even the people whom it was intended to benefit.

I The consular order which declares the "Rules" to be obsolete, but which, nevertheless, is headed "Amendment," bears date of June 13, 1901, and is signed by the Consuls-General of Great Britain, Germany, and the United States. It does not say directly, or by implication, that the "Amendment" has ever been submitted to the Chinese Government, or that it has the sanction of any representative of that Government. It would seem, therefore, to resemble an alteration in the terms of a partnership agreement which has been indorsed on one copy of the written instrument by one of the partners without the knowledge or consent of the other.

The Chinaman may be perfectly well aware that his officials "squeeze," and that his Government, generally, is inefficient and corrupt; but it is his own business; he is used to Oriental practices, and he resents foreign interference, however well meant, just as vigorously as we should resent foreign interference with the methods of Tammany or with boss rule in Philadelphia. In the case of the Mixed Court there were evils that needed to be remedied, but the Council and the consular assessors had no authority to remedy them by the course of treatment which they adopted. rights and powers of the Chinese magistrate had been definitely fixed by international agreement, and had been set forth in certain "Rules" which could not be changed or abrogated without the consent of the Chinese Government. The Court might be corrupt or unjust or cruel; but it was dealing with its own people—not with foreigners—and over its own people, in cases not involving foreign rights or interests, it had as complete jurisdiction as the municipal police court had over the subjects of Great Britain.

About the middle of the year 1905 the Chinese Government made what seemed to be a sincere attempt to meet the complaints of the Municipal Council and to improve the character of the Mixed Court by appointing as magistrate a young and enlightened sub-prefect named Kuan-Chun, who spoke English well, and who was admitted, even by supporters of the Council, to be an "able, energetic, and intelligent official." About the same time the Taotai, or Chinese prefect of the city, wrote a letter to Dr. Knappe, then the senior Consul-General, calling his attention to the continued violation of the "Rules" by the Municipal Council and the European police, and asking him to lay the matter before the Consular Body for consideration and appropriate action. Dr. Knappe sent the Taotai's letter to the Council, and received from the Chairman a reply in which the alleged shortcomings of the Court and the remedial measures taken by the municipal authorities were fully set forth. This reply seems to have been very unsatisfactory to the Consular

Body, inasmuch as it elicited from Dr. Knappe the following caustic rejoinder:

Shanghai, 13th July, 1905.

F. Anderson, Chairman Municipal Council: Dear Sir-I have the honor to acknowledge the receipt of your letter of the 4th inst., which has had the Consular Body's careful consideration. I have been instructed to express our most serious regret that the Council thought it advisable to make certain police arrangements in the procedure of the Mixed Court which exceed the power and authority of the Council as well as that of the Superintendent of Police. By your action the Consular Body is placed in a very awkward position. Instead of suggesting the measures to the Taotai, and threatening their execution, if necessary, without his consent, we have now to defend proceedings which the Council was not entitled to adopt. There is no doubt that the treaties do not recognize the Council as a controlling authority over the Mixed Court. If there is any such con-trol, it rests with the Taotai and the Consu-lar Body. Only reluctantly we have sanctioned your stationing a policeman within the precincts of the Mixed Court, and have taken the responsibility upon ourselves; but we are not prepared to continue this practice. We have shown by our action that we are willing to support the Council in its endeavors to put the Mixed Court of Shanghai on a proper basis; but you will facilitate matters by acting within your competence. In our letter of the 1st inst. we expressed our opinion that it will be inexpedient to press for the adoption at the present time of any amendments in the procedure of the Court beyond those to be effected by eleven new rules now under consideration by the Chinese Government, and you informed the Consular Body on the 4th inst. that you acquiesced in this decision. Notwithstanding, you intro-duce new rules at the Mixed Court without asking anybody, and modestly call them police arrangements." I have the honor to be, sir,

Your obedient servant,
DR. KNAPPE,
Consul-General for Germany and Senior
Consul.

This letter, it will be observed, is, in effect, an official admission that the Municipal Council had no authority over the Mixed Court; that the "Rules" and procedure of the Court could not be changed without the consent of the Chinese Government, and that in making changes forcibly, without such consent, the Municipal Council had acted unjustly and illegally. These were the precise contentions of the Chinese, and their protests were based precisely upon these grounds.

One would suppose that, after receiv-

ing such a rebuke from the whole body of foreign consuls, the municipal authorities would have let the Mixed Court alone-especially as the Chinese magistrate then on the bench was a man of education and high character, who had already shown a disposition to reform the Court and make it all that it ought to be.1 The Council still continued, however, to harass and irritate the Chinese by unwarranted interference and supervision, and even made it unpleasant for the American assessor, Mr. Arnold, when the latter declined to sanction certain municipal "police regulations" which limited the power of the Court in Chinese cases, and which were not in accordance with the "Rules." Mr. Arnold took the ground that the Mixed Court was primarily a Chinese tribunal, and that he, as a foreign consular officer, had no right to interfere with its procedure unless foreign interests required such interference and the "Rules" of the Court sanctioned it. Resenting the attitude thus taken by the American assessor, the Council first made complaint of it in a letter to the Consular Body, and then, through the British assessor and the police, began to docket and remand a certain class of cases in such a way that they would not come up for hearing on the days when Mr. Arnold sat on the bench as associate magistrate. This increased the friction between the Chinese authorities and the Municipal Council, and on the 6th of December the Taotai found it necessary to make another protest to the Consular Body with regard to the continued interference of the Council and its police in cases where Chinese only were accused and in which no foreign interest was involved. This was only two days before the Mixed

Court trouble reached a crisis, and less than two weeks before the outbreak of the riot. Meanwhile, the Chinese Government had given further evidence of its desire to improve the Court by appointing as assistant magistrate another bright young Chinese official named King-Shao-Cheng, who had had three years of educational training at King's College, London.1

Although the Chinese resented and resisted all encroachments upon the power and authority of their own magistrate in dealing with their own people, the thing to which they objected most strenuously, and which they opposed most vigorously, was the sending of arrested Chinese women to the municipal jail, to be under the charge of Sikh jailers.2 The reasons for the feeling that they had in this matter were two. In the first place, they believed that they had a legal right to keep their women

nad a legal right to keep their women

'Mr. King (or, as the name is sometimes spelled, Ching) will perhaps be remembered in America as one of the three brothers who were held up as coolies by the customs officials in Boston when they landed there on their way back to China in June of the year 1905. In a letter written to President Roosevelt at that time by B. Atwood Robinson, of Boston, the King brothers were described as "of the highest class in China, and among the wealthiest and most influential in the Empire." The appointment of one of these young men as assistant magistrate of the Mixed Court would certainly seem to indicate sincerity and good faith on the part of the Chinese Government in the work of reform.

'The Municipal Council and the foreign residents of Shanghai were well aware that the Chinese had this feeling with regard to the Sikh jailers. On the 12th of December—a week before the riot—the "North China Daily News," the strongest journalistic supporter of the Council, and one of the ablest papers in China, said, in a leading editorial: "We believe it will be found, when the passions of the moment cool down among the Chinese, that a great factor in arousing them has been the dread they have of the Sikh police and the Sikh gaolers. It would, we believe, be useful if a joint inquiry were held into this question, and pains were taken to prove to the Chinese that no unnecessary harshness is practiced toward prisoners in the municipal gaol. . . . There are complaints, which may be entirely unfounded, of the Indian warders, and it would be well to reassure the Chinese on this point." At almost exactly the same time the "Nanfangpao," the leading Chinese paper of Shanghai, said editorially: "The opinion of the Chinese, with regard to the municipal gaol s far from flattering. Notwithstanding its much-vaunted sanitary condition and the human treatment of its inmates, the death-rate of the prisoners has been fearfully high, and with regard to the manner than the sanitary condition and the humane treatment of its inmates, the death-rate of the prisoners has been fearfully high, and there is just cause for the complaint that no official inquest is held when such deaths occur. This gives rise to rumors of ill-treatment and general abuse of the Chinese prisoners by the European gaoler and his fierce Indian warders. Be that as it may, the belief is that no Chinese sentenced to a term of imprisonment longer than one year ever survives his punishment at that no Chinese sentenced to a term of imprisonment at longer than one year ever survives his punishment at the municipal gaol, and that, however cruel the warders are at the Mixed Court or at any other Chinese court, the death of a criminal undergoing a long term of imprisonment is practically unknown." According to the official report of the superintendent of the municipal jail, forty-one prisoners died in the year 1904, out of a prison population which averaged about four hundred and sixty. This would give a death-rate of nine per cent., which is certainly high.

¹In July, 1905, the new magistrate, Kuan-Chun, discharged seventeen of the twenty-six "runners," or Chinese attendants of the Court, and trebled the salaries of the remaining nine so as to leave them no excuse for the "squeezing" and bribe-taking of which the Municipal Council had complained. He also made arrangements to have the men's and women's wards of the Mixed Court jail inspected by a sanitary expert, with a view to improving their condition if necessary. About the same time the Taotai, or Chinese Prefect of the city, gave orders to enlarge the jail by erecting new buildings, and notified the senior Consul that the sites for these buildings had been approved by the British consular assessor, and that the necessary money for the improvements had been set apart. Early in December corporal punishment and the use of the cangue were abolished in the Mixed Court, by order of the Board of Punishments in Peking; so that this cause of complaint was also removed. of complaint was also removed.

prisoners in their own jail; and, in the second place, they feared and hated the East Indian Sikhs who were employed in the municipal jail as turnkeys and wardens. It was bad enough to have to turn their male prisoners over to such guardians, but to be forced to put their women in the hands of Sikhs was absolutely intolerable. In order to get the native view of this matter, suppose, for a moment, that China had twice the military strength of Japan and was therefore powerful enough to treat American residents in China as she chose. Suppose that the Chinese authorities, having failed to get us to surrender our extraterritorial rights, put a Chinese assessor into our American consular court at Shanghai, for the purpose of looking after Chinese interests in "mixed" cases. Suppose that this assessor, in direct violation of the "Rules" agreed upon by the Chinese and American Governments. attempted to control and regulate the Court's procedure in purely American cases, where no Chinese interest was involved. Suppose, finally, that the Chinese Municipal Council and its police deprived the Court of the custody of its own American prisoners, and even went so far as to put American women into a Chinese jail, where their own consul could not look after nor protect them, and where the turnkeys and warders were not even Chinese, but were fierce Tibetans, or half-wild Mongols from the Desert of Gobi. How should we be likely to feel with regard to such a state of affairs? The supposition may seem extravagant, but it will serve, perhaps, to give the reader a glimpse of the case from the Chinese point of view, and will enable him to understand the storm of indignation raised by the Li-Wan-Chih incident, which I am about to de-

On the 7th of December, Madame Li-Wan-Chih, a Chinese lady of some social position and the widow of a mandarin, took passage on a Yangtse River steamer for Shanghai, en route to Canton. She was carrying with her a coffin containing the remains of her dead husband; she had a hundred or more pieces of baggage; and she was accompanied by a retinue of servants and attendants,

including a number of young girls. Before she reached her proximate destination somebody up the river telegraphed to the British superintendent of police at Shanghai that she was a procuress; that she had kidnapped a number of young Chinese girls; and that she was taking them to Shanghai or Canton for immoral purposes.1 Upon the arrival of the steamer at Shanghai the whole party was arrested and taken to the Mixed Court for examination. Madame Li, the accused, declared that she was neither a procuress nor a kidnapper; that the young girls in question were her personal attendants and slaves whom she had legally bought; and that she had documentary evidence in her baggage to prove the truth of her statements. In order to give her an opportunity to produce this evidence, the Court decided to remand the case, and both the Chinese magistrate and the British assessor, Mr. Twyman, agreed that meanwhile the young girls should be sent to a charitable institution for Chinese women known as "The Door of Hope." With regard to the disposition to be made of Madame Li the two magistrates differed. Mr. Kuan-Chun, believing that she was an innocent lady, wished to admit her to bail: while the British assessor insisted that she should be sent to the municipal prison. Before any agreement had been reached, the municipal police attempted to remove her by force, and were opposed by the Chinese constables and by Assistant Magistrate King. This led to a disorderly fracas, which broke up the session of the Court and ended in the forcible removal of the woman by the municipal police. The Chinese say that in the course of the fight Mr. Kuan-Chun and the assistant magistrate were insulted and threatened, and that a British policeman attempted to strike Mr. King with a club. This may or may not be true; but certain it is that Madame Li was forcibly taken from the custody of a Chinese court and put into the hated jail of the British municipality; and this was enough

¹ The Shanghai police have never made public the name of their informant. Some Chinese say that the telegram was sent by a missionary, and others that the sender was a steward on the river steamer, who was angry because Madame Li had not given him a sufficiently liberal fee, and who took this method of getting even.

to throw the whole Chinese community into a fever of indignation and wrath. The Chinese Chamber of Commerce and the powerful Canton Guild took the matter up; mass-meetings of excited Chinese were held in various parts of the Settlement; protests were made to the Viceroy of the province and to the Board of Foreign Affairs at Peking, and the Taotai notified the Consular Body that the Mixed Court would not reopen until the conflict of authority had been settled.

In a speech to representatives of the Chinese Chamber of Commerce, various educational societies, and the native press, made two days after the closing of the Court, the Taotai said: "I must apologize to you all for not having managed foreign affairs in the past with sufficient firmness, and the result is the disgraceful trampling upon our rights which was witnessed at the Mixed Court two days ago. Be assured that in this instance I will use every exertion to erase the shame inflicted on the Chinese Government and the people by the action of the British assessor and the municipal police. I am willing to give up my post in the fight for justice and fair play."

On the morning of December 13 the Consular Body, having become convinced of the innocence of Madame Li, directed the Municipal Council to order her release, and on the 15th she was set at liberty. This, however, did not quiet the excitement of the people, who continued to hold mass-meetings for the purpose of denouncing the Municipal Council, the British assessor, and the police, and protesting against the sending of Chinese women to the municipal jail. Finally, three days later, the smoldering embers of popular resentment and indignation burst into the flame of an antiforeign riot. That this resort to mob violence was premeditated and planned there is, I think, little doubt; but it is impossible as yet to say who instigated and directed it. The better class of Chinese took no part in it, and the native press condemned it; although both undoubtedly sympathized with the feeling that seemed to lie back of it. So far as one could judge from appearances, the local Chinese authorities did what they could to repress the disorder. The Taotai himself went repeatedly through the area of disturbance, addressing the people and trying to restrain them from violence, and, if I do not err in time, he was making his first trip through the storm-center at the very moment when my hot-headed fellow-countrymen at the Astor House were suggesting that he be lynched or sent on board a war-ship in irons.

In view of the fact that the fracas in the Mixed Court and the subsequent riot resulted, more or less directly, from the dispute with regard to the custody of Chinese prisoners, I felt a natural curiosity to see the jails in which the latter were confined; and Thursday afternoon, when the city had become fairly quiet, I went with Mr. Arnold, the American vice-consul, to inspect them. The Mixed Court and the Chinese jail attached to it were situated in a walled compound on one of the cross streets of the native quarter near the end of the Boone Road. At first sight there was nothing distinctively Oriental in the appearance of either of them. The substantial two-story buildings of gray brick would not have seemed particularly out of place in any British or American town, and the court-rooms and cells differed little from apartments of the same kind in the West. The jail would accommodate, I should think, about one hundred and thirty prisoners. The cells of the lower story, which opened on a grated, cage-like corridor. were as spacious as the kameras of a Russian prison, and were intended, apparently, to hold ten or fifteen men each. The floors were fairly clean, the walls had recently been whitewashed, and two sides of every room were occupied by low, bare wooden platforms, on which the inmates sat during the day and slept at night. Most of these cells had no windows, but their large doors of crossed iron bars admitted plenty of light and air—more air, in fact, than was desirable, inasmuch as there were no heating facilities and the weather was cold. prisoners wore, apparently, the clothing in which they had been arrested, and I saw no blankets, pillows, or bedding. The second story of this building was intended for prisoners of a better social class, and was divided into rooms a

little larger than an American hall bedroom. In these cells there were windows, wooden sleeping-benches, and, in a few cases, chairs; and each room had two occupants. Smoking and tea-drinking were permitted.

In the women's ward, where there was a Chinese matron, the rooms were of the large kamera type, and contained no furniture except a single tier of wooden bunks around the sides. If overcrowded, they would be very uncomfortable; but a few women—half a dozen, perhaps could live in each of them without great hardship. The jail, as a whole, was neither very clean nor very dirty, and its sanitary condition, so far as I could judge, was quite as good as that of Chinese houses generally. The cells were all cold, and for prisoners without blankets or pillows they must have been uncomfortable at night; but, on the other hand, the discipline was evidently rather lax; prisoners were allowed a good many privileges—especially if they or their friends could pay for them-and there was always the companionship which goes so far to ameliorate the hardships of prison life.

With regard to the municipal jail, which we visited the same afternoon, I need only say that it is a fine, large, modern penitentiary, where the system is that of solitary confinement; where the four hundred and eighty cells are small, bare, windowless boxes of cement and iron, arranged in superimposed tiers, like the book-stacks of a great library: where strict discipline is maintained by forty-four stern, dark-faced Sikhs in colored turbans; where the silence and stillness never seem to be broken; where all the sanitary arrangements are apparently perfect; but where the annual death-rate is nine per cent., and where a suicide net is stretched across the inner courtyard, under the four tiers of cells, to catch the bodies of prisoners who, as they go to their work, throw themselves down with the hope of dashing their brains out on the pavement. The jail has large, well-lighted, and wellventilated workshops, a reformatory for children, and an up-to-date hospital; the prisoners are kept warm by a uniform prison dress lined with six pounds of

quilted cotton; they have three blankets to wrap around them when they lie down on their cement floors at night; they exercise an hour every day and take a bath once a week; and they are fed with rice and wheat enough to keep them in a state of health. Everything is clean and orderly; everything seems to be arranged and managed in accordance with the latest precepts of modern science; and yet the prison, as a whole, makes, even upon a foreigner, an impression of tomb-like stillness, loneliness, and gloom. It is, on a small scale, a British Dartmoor erected in the Orient for the detention and punishment of people who are extremely gregarious in their habits; who habitually live crowded together in the closest association; and who, from the cradle to the grave, are almost never alone. The dread with which they regard such a penitentiary and the preference which they show for their own prison are quite understandable. The average Chinese coolie would rather wear a cangue and be "squeezed" or occasionally bambooed in the Mixed Court jail, where at least he has human companionship and where the jailers are of his own race, than live alone under the watchful, unsympathetic eye of a turbaned Sikh in one of those gloomy cement boxes over the suicide net. The Municipal Council may say that the object of a prison is to inspire fear, and thus deter from crime; but if Europeans wish to live in peaceful friendliness with Asiatics, they should pay some attention to Oriental feelings and conditions of life, and not impose Western institutions and methods upon the Chinese without the latter's consent and without sanction of treaty or law.

In the fourth week of December the Waiwupu, or Chinese Board of Foreign Affairs, and the diplomatic representatives of the Powers at Peking, agreed upon a modus vivendi with regard to the most important of the matters in dispute at Shanghai, including the custody of Chinese women, and on the morning of the 23d the Mixed Court was reopened, under protection of a strong guard of marines, European police, and Sikhs. Mr. Arnold and I were present as spectators, and through the courtesy of

Assistant Magistrate King and the German assessor, Mr. Schirmer, I was permitted to take a seat on the bench. court-room, which contained no railings, seats, or furniture, was divided into a European half and a Chinese half. On one side stood the Chinese constables or attendants, on the other the municipal police, and between them there was an open space reserved for criminals and litigants. The Chinese prisoners were brought from the jail in gangs of three or four, tied together by their queues, and each culprit, as his case was called, was led forward by his queue and forced to kneel on the floor in front of the bench. A British police officer on the European side of the court handed to the German assessor a "charge sheet," and made a brief statement of the case in hand, while a native constable on the Asiatic side performed the same service for the Chinese magistrate. The cases, which were mostly larcenies, misdemeanors, and assaults, were disposed of at the rate of thirty or forty an hour, the Chinese magistrate entering the decision or sentence on his charge sheet with a slender brush dipped in vermilion ink. No witnesses were examined, and the accused were not represented by counsel; but in most of the cases there were material proofs in the shape of exhibits, which ranged from murderous-looking daggers and iron slugging-bars with handle-wrappings of bamboo, to ingots of copper, articles of clothing, pieces of broken furniture, and Singer sewing-machines. These objects, in turn, were held up before us for inspection or handed to us for closer examination. Now and then the accused were questioned by the Chinese magistrate, and sometimes they were permitted to make brief statements in their own defense; but, as a rule,

they were summarily condemned upon the evidence furnished by the police. Six or eight participants in the riot were arraigned, and were sentenced to imprisonment with hard labor for periods ranging from three to twelve months.

The case that interested me most was that of a pallid, unhealthy-looking slave child—a girl only seven or eight years of age-who had been treated with atrocious cruelty by an old woman who was said to own her. When the child attracted the attention of the police on the street, she was hoppled or fettered with a brass chain and a padlock, which were handed up to us as an exhibit. By direction of the Chinese magistrate, the girl was undressed in the court-room. and we discovered that her back was a mass of big scars and deep, half-healed sores, which had evidently been made by holding a red-hot iron against the flesh. This method of punishing children is not uncommon in the East, but I had never seen its results before in an aggravated case, and I was surprised when the Chinese magistrate gave the woman only one month's imprisonment in the Mixed Court jail, and sent the unfortunate girl to the Sinza House of Refuge. I sat on the bench until I wearied of the evidences of cruelty, dissension, destitution, and crime, and then returned to the consulate to talk with Mr. Arnold about the Mixed Court and its probable future.

I have left myself no space for a discussion of the Shanghai riot and its causes in their international aspect; but some of the lessons of the conflict are sufficiently obvious, and I shall have occasion in a future article to consider, in a broader way, the reasons for the anti-foreign feeling in China and the best method of dealing with it.

Comment on Current Books

Among the books recently Some Notable received which are of suffi-Recent Books cient importance to call for careful consideration and future thorough treatment are: The first volume of Dr. Henry C. Lea's "History of the Inquisition of Spain"-to be completed in four volumes, and, in view of the value of the author's general History of the Inquisition, in all probability an authoritative and important work, the outcome of long investigation, at first hand, of the Spanish archives (Macmillan); the second volume of Alexander Johnston's American Political History, which deals with the important topics of "Slavery," "The Civil War," and "Reconstruction" (Putnams); "The Menace of Privilege," by Mr. Henry George, Jr. (Macmillan); Mr. Winston Churchill's Life of his father, "Lord Randolph Churchill," which is described as an eminently readable and vivacious work (Macmillan); a new volume of Mr. Santayana's philosophical work on "Life and Reason" (Scribners). In fiction, the most notable volumes lately received are Miss Glasgow's "Wheel of Fire" (Doubleday), Mr. George Moore's "The Lake" (Appletons), and Mr. Eden Phillpotts's "The Portreeve" (Macmillan).

Mr. E. F. Benson's new The Angel of Pain novel is a singular mingling of the attractive and the disappointing. It is in its plot and situations distressing, but in its pictures of English society it is extremely interesting, and there are several characters worth knowing and rather carefully worked out. It is a pity, we think, that Mr. Benson persists in dealing in his fiction with symbolism and occultism. In this he follows the lead of Mr. Hichens, but with much less success. In the present story, for instance, the man who returns to nature, lives in the woods, discovers that he can by mental sympathy call the birds to his hand, and enters into inexplicable intimacy with the forest creatures, in the end becomes ridiculous rather than impressive. He believes in the joy of nature, but half fears and half hopes that at some time the whole of nature sorrow as well as joy—will be revealed to him, and this he calls seeing Pan. There is an ancient pagan myth that whoever sees Pan will not survive the sight, and Mr. Benson intimates that his hero's sudden death is of this kind, but makes the whole thing ludicrous by leaving the reader in doubt as to whether the man is killed by being butted to death

by a real goat or dies because he sees Pan in his mythical goat-like shape. (The J. B. Lippincott Company, Philadelphia. \$1.50.)

We know of no other book Argumentation which exactly occupies the and Debate same field with this volume by Professor Craven Laycock and Mr. R. L. Scales, both of Dartmouth. It systemizes and makes a unified art of the principles which should be followed in preparing for the presentation of a given subject in the form of reasoned argument. Some of the sub-topics under which the whole subject is treated may indicate the scope; such are, "Preliminary Reading," "Evidence," "Fallacies," "Brief-Drawing," "The Introduction" and "The Conclusion," and "Refutation." There is not a little sensible advice and acute suggestion to be found in this book, and it is likely to be useful, not only in the class-room, but to all persons preparing for public discussion. (The Macmillan Company, New York. 60c.)

The author, Dr. George Biographic Clinics H. Gould, believes that many more bodily ills are due to defective vision than most people imagine. This is the third volume under the title. In this volume, among other matters, he discusses the probability that the death of John Addington Symonds from pulmonary tuberculosis was due ultimately to eye-strain, and the neglect of the eyes that occasions not only such physical defects as curvature of the spine but such moral calamities as crimes growing out of truancy. Dr. Gould does not think it right to treat this subject as merely "a scientific or professional one," but regards it evidently as one on which people generally should be well informed. It seems to us clear, however, that it is not a question on which one can have very intelligent opinion without scientific and professional knowledge. It is well for people generally to know in what direction physical danger lies; but they can avoid danger safely only by counsel and direction from the expert. (P. Blakiston's Son & Co., Philadelphia. \$1, net.)

A Complete
History of Music
with seven American associates, is suitable for the general reader who wants in a single growth of the art. Especially full and informing are the early chapters dealing with the origin and primitive evolution of music.

In general the discussion of the development of the various phases of music is free from exaggeration. A joint product of this kind, however, is almost sure to be marked by one defect-lack of continuity and proper proportion in the consideration of certain topics. The lack of continuity is noticeable, for instance, in the discussion of Bach; and lack of proportion is especially noticeable in the chapters on modern music. No sound reason can be given for devoting nearly two thousand words to Richard Strauss, while allowing Brahms barely five hundred, and dismissing Tschaïkowski (whose name, by the way, does not appear in the index) with a scant two hundred and fifty. (Theodore Presser, Philadelphia, Pa.)

Days of the Past

The author, Mr. Alexander Shand, a Scottish writer and traveler, gives us here a "medley of memories" of men and things and of the changes he has observed in social, professional, and business life. He has a good store of observation to draw upon, and enlivens his talk by frequent anecdote and aptillustration. The book is discursive and agreeable rather than important. (E. P. Dutton & Co., New York. \$3, net.)

The unique natural attrac-The High-Road tions of India, its wonderof Empire ful architecture, its rich historical associations, and, above all, its interesting people-whose character and customs seem to pass unaltered through the ages-make a book like Mr. A. H. Hallam-Murray's "High-Road of Empire" well worth reading. The author treats of the varied features of India with an intimate and illuminative touch. India needs to be celebrated and described also by just such physically made a volume as this, printed in superbly clear and large type, making a book for tired eyes; published with many artistic colored pictures, a delight to any eyes. The entertaining and instructive text merits such type and such illustration, and it merits as well the book's extremely attractive binding. (E. P. Dutton & Co., New York. \$5, net.)

In The Outlook of Sep-A History of the tember 2, 1905, will be United States found a somewhat detailed and Its People survey of the first volume of this imposing historical undertaking by Dr. Elroy M. Avery. The volume now calling for comment is the second in his work, and covers, speaking generally, the events of the first half of the seventeenth century. It thus deals with the foundation-laying of the United States, the colonization of New England, Virginia, Maryland, New Netherland, New Sweden, and, as necessary to a thorough understanding, New France. What we said of the opening volume will apply here, although with some modifications. In the first five of the eighteen chapters the interest does not seem to us nearly so well sustained; but an even higher level is reached in certain of the later chapters. Throughout is evident the master desire for accuracy and impartiality, and both have been attained to a really remarkable degree. Puritans, Catholics, Quakers-all the conflicting elements in the youthful colonies are treated with scrupulous fair-mindedness. On the other hand, justice is scarcely done to some of the leading actors-particularly the Stuart kings-on the other side of the water. Indeed, as in the first volume, Dr. Avery appears to appreciate only imperfectly the significance of European movements and conditions in their relation to the development of the New World. We notice, too, that in treating the several colonies he pays inadequate attention to the operation of economic forces. It may be added that the publishers now announce that the work will be completed, not in twelve volumes as originally projected, but in fifteen, possibly sixteen, volumes. (The Burrows Brothers, Cleveland.)

Portions of many of the best Hymn hymns, ancient and modern, are Treasures included in this collection, with notices of their occasions and their authors. Noted translators and translations, with "a few words about tunes," are added. The chapter on "Hymns in Literature" may suggest the fact that there are hymns which lack an undisputed title to be classed as literature. The author, Miss Grace Morrison Everett, has aimed at making a popular rather than a critical work. It is worth noting that Samson Occom, not "Ockerman," is the name of the writer of the eighteenth-century hymn,

"Awaked by Sinai's awful sound," the single Christian lyric by an American Indian. (Eaton & Mains, New York. \$1.25.)

In Old Bellaire

Mrs. Mary Dillon has written here a simple story of social life in a quiet southern Pennsylvania college town. The college attracted Southern youths, and later became a center of excitement, as did all the border between North and South during the war. Into this free and happy community came the demure, pretty New England girl, Eunice. Her love story, an old-fashioned picture, so long ago do war times seem, is troubled by her patriotic and religious scruples, for Rex, an attractive student from the South, wooes her. That he wins her is due to her ripening nature and to his loyalty to her, even though

he joins the Confederate army. (The Century Company, New York. \$1.50.)

The passionate outcry of Jesus' Christianity a tender heart, horrorstricken at the outrages of demoniac crime, finds utterance in this volume by a gifted Jewess, Miss Nadage Dorée, author of a remarkable book, "Gelta, or the Czar and the Songstress." The contrast between the Christian religion and the religion of Christ, which writers in easy chairs have noted with cooler criticism, she notes, as seen especially in orthodox Russia, with feelings akin to frenzy in beholding the unchecked cruelties of Russian fiends. Literary form disappears in the volcanic outburst of tortured feeling. Christian America, as well as other Christian powers, is held culpable for not forcing the hand of the Czar to stop the carnival of hellish wrong. This misjudgment is easily forgiven if one remembers Holy Writ: "Oppression maketh a wise man mad." A much more effective protest than that which Russia heard from us after Kishinev should have been made vears before by certain Jewish bankers, the holders of Russia's purse-strings, against her long-continued anti-Semitism, of which Kishinev was the natural fruit. (The American News Company, New York. 50c.)

The editor of the Beacon Biog-John Fiske raphies, of which this volume is a unit, may well find place for the historian Fiske. In these days of minute research it has become somewhat the fashion to disparage his writings because their material was not gathered from first sources; and there can be no doubt that recent investigation has placed in quite a new light many of the facts with which he dealt. At the same time it has demonstrated the essential soundness of his work, and leaves him among our worthiest historians. Certainly, few have done so much to make history attractive to the general public, and if only for this reason he deserves recognition in a series of studies intended "to furnish brief, readable, and authentic accounts of those Americans whose personalities have impressed themselves most deeply on the character and history of their country." Mr. Thomas Sergeant Perry, the author of this biographical essay—it is really too slender to merit the name of biography on Mr. Fiske's life and works, writes from intimate personal knowledge and with unmistakable admiration. He is, indeed, inclined to be over-eulogistic, and his portrayal suffers from awkward phraseology. But in spite of this he contrives to convey a good idea of Mr. Fiske both as man and as writer. (Small, Maynard & Co. 75c., net.)

The Long Arm Le Droit Conners, the silent, observant, handsome man, who acts as amateur detective in a succession of tragic mysteries, is as quick at solving riddles, when the least clue is given, as the rest of his tribe in detective stories. Murderers, counterfeiters, dishonest gamblers, kidnappers, and all manner of evil-doers are ferreted out and brought to justice by this astute young man, who occupies his days painting beautiful pictures. The author is Mr. Samuel M. Gardenshire. (Harper & Brothers, New York. \$1.50.)

The Musicians, There is a strong contrast between the two latest col-Library lections in this series to come to our notice; one collection consists of "Songs and Airs by Handel," fluent and conventional; the other of "Seventy Scottish Songs," racy and unsophisticated. Ebenezer Prout, who edits the Handel collection, displays, both in the introduction and the editing of the songs, the scholarship which is expected of him. These songs, of course, are taken from operas which, so far as performance on the stage is concerned, are obsolete, and from oratorios. They appear in two volumes—one containing arias written for high voice, soprano or tenor; the other, those written for low voice, contralto or bass. The Scottish songs, in a single volume in two editions-one for high, the other for low voice—have been chosen with intelligence. Here are some which are universally known, like "Auld Lang Syne;" others, like the "Islay Maiden," will be strange and new to most hearers, but are more characteristic. Mme. Helen Hopekirk, the editor, has had a difficult task and has performed it well. She has written piano accompaniments to these folk-songs, which preserve to a considerable degree the primitive traits which the melodies possess. In some cases she has conveyed the spirit of these songs with notable success. The introduction she has written to this volume is a sympathetic interpretation of Scottish music. (The Oliver Ditson Company, Boston, Mass. \$1.50 each.)

Oxford and the Cotswolds

This is a new and welcome volume in "The Highways and Byways" series. These books have proved attractive to a large number of readers and travelers, including the "Tarry at Home" variety. The excellent line engravings are a welcome change, from the excessive publication of half-tone cuts, and the topics of the several volumes are invariably such as to make picturesque illustration easy. This is emphatically true of the present book, in which Mr. Herbert A. Evans writes in a discursive and agreeably

rambling way. He takes Oxford as a starting-place, and wisely devotes far the larger part of the book to less well-known places. Many Americans know of Woodstock, Banbury, Horley, and Edgehill, but how many have ever heard of Upper and Lower Slaughter, Temple Guiting, Chipping Warden, Stow-on-the-Wold, or Lower Swell? These are but samples of the many quaint names of scores of English villages through which the author takes his reader in a leisurely pedestrian trip. Everywhere he finds ancient halls, ruined abbeys, picturesque cottages, or old-fashioned inns, and his narrative abounds in local traditions, legends, and the drift of the side-eddies of history. The drawings are by Frederick L. Griggs. (The Macmillan Company, New York. \$2.)

The parson in this tale The Sage Brush of frontier life by A. B. Parson Ward has not the unassailable strength that some of his predecessors in fiction have shown. His is a complex nature; deeply and devoutly persuaded of the reality of his religious mission, he yet possesses a highly emotional artistic temperament. The abrupt changes from prophetic fervor to gay, boyish light-heartedness are admirably indicated. How he fared and how silently he suffers in his chosen work must be left to the reader to find out for himself. With a striking hero, and the varied assortment of men and women to be found in a mining town, the tragic climax is only logical. (Little, Brown & Co., Boston. \$1.50.)

This story is by C. F. Sarah Bernhardt Pidgin, whose tale called Brown "Quincy Adams Sawyer" proved, we believe, entertaining to many readers. The present book aims at comicality rather than humor, and combines a rather sensational plot with somewhat too extended and thinly drawn out descriptions of country character and rustic pranks. The extent of the ground covered may be judged from the fact that the author publishes an alphabetized list of the "Personnel" of the book which covers seven pages. (J. K. Waters & Co., Boston, Mass. \$1.50.)

Selections from the Poetry of John Payne
rival, according to the opinion of competent judges. His reputation was made by an incomparable translation of "The Arabian Nights," and was heightened by his metrical translation of Villon. In this volume his inventive genius and remarkable use of melodious English give an unusual pleasure to the appreciative reader. His ballads equal

the best of English songsters, and the themes they set forth are marvelously fitted to their form. In the present collection, made with loving care by his friends, with the intention of introducing his work to American readers, it is difficult to pass by any one of the selections. They are exquisitely graceful and yet profoundly impressive, pervaded by a moving undertone of sadness, which perhaps reaches its full expression in the beautiful poem "The Grave of My Songs." How the poet could have remained in comparative obscurity so long can only be explained by the pre-eminence of his translations, and his own exceeding modesty as to his original writings. "The Ballad of Isobel" and "The Rime of Redemption" alone place the poet high among modern singers. The lighter vein of the dainty Barcarolles and Rondeaux and Madrigals is equally attractive. (John Lane Company, New York. \$2.50, net.)

In every sense of the word, The Thread of this volume by the author Gold of "The House of Quiet" is indeed a beautiful book, one that will give the reader a realization of the joy of life. It is a succession of exquisite sketches presented by an artist gifted with the elusive literary touch and a delicate instinct for the beautiful. The thread of gold has two strands, ardor and tranquillity, interwoven to make a cord of strength and beauty with which to bind our life together. The author passes without haste or jar from sensible practical philosophy to prose hymns that are full of hopeful inspiration. We pause in the tender light shed over the picture of a visit to a crippled man, "whose laugh had the careless and good-humored ring of one whose mind was entirely content." He and his wife were a gallant pair, abiding in a serene region above humanity and pain. comes a charming chapter upon authorship, which should be read by every one who feels the necessity of expression. The pleasures of work are sung-not in too exalted strain, and with touches of gentle humor. Oxford, Canterbury, Tower, Dorsetshire, all breathe the love and homage of an English heart for the memories and traditions of his own land. The religious reflections—though truly the religious spirit is on every page-are peculiarly refreshing, individual without being too assertive, and truly devout though lacking entirely the conventional tone. The closing chapters upon the deeper verities, thoughts that fill the mind when experience has taught us lessons, are full of quiet power, and shed the same sunshine that Faber found long ago could stir new life in the heart. (E. P. Dutton & Co., New York. \$3, net.)

THE OUTLOOK is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The fourth issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

PRICE.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

POSTAGE IS PREPAID by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila (Samoa), Shanghai, Canal Zone, Cuba, Canada, and Mexico. For all other countries in the Postal Union add \$1.56 for postage.

CHANGE OF ADDRESS.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

DISCONTINUANCES.—If a subscriber wishes his copy of The Outlook discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

HOW TO REMIT.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of The Outlook Company. Cash should be sent in Registered Letter.

LETTERS should be addressed:

THE OUTLOOK COMPANY

Chicago Office, 1436 Marquette Building

287 Fourth Avenue. New York

Dress Linen*s*

At "The Linen Store"

As usual our dress goods department displays not only a very wide, but a most distinguished assortment of linen fabrics of all kinds suitable

for waists, skirts, and entire frocks. The collection throughout is of the same breadth and character which have made "The Linen Store" famous.

We mention particularly:

Solid Colored Yarn Dyed Dress Linens, 50c. per yard.

Colored French Costume Linens, 60c. and 85c. per yard.

French Linen Chiffon, 85c. and \$1.20 yd. Natural Colored Linen Crashes, 25c. and 35c. per yard.

White Linen Lawns, 35c. to \$2.50 yd.

Solid Colored Linen Etamines, 55c., 65c., and 75c. per yard.

Colored French Costume Crash, \$1.50 yd. Light weight French Costume Linen, 85c. yd.

Natural Colored Linens, 75c. per yard. White Linen Ducks, 50c., 60c., 75c., and \$1.00 per yard.

Our assortment of Cotton Dress Goods is equally attractive and includes every desirable material now in vogue.

Mail orders receive our prompt attention.

Railway Rate
Regulation
in the Senate
Regulation
Railway
Rate Regulation Bill, as

heretofore explained in our columns, without amendment. This may mean, as some Washington correspondents appear to think, that there is a majority for that bill as it stands; it more probably means that a majority in the Senate wish to debate the bill, and any amendments to it, before the public, and not in secret session of the Committee. This is wise. We judge that there is no serious opposition in the Senate to a bill incorporating the two fundamental principles on which the President has laid stress: (1) That the Commission shall have power to fix rates; (2) that the rate fixed shall go into effect at once, and not wait until the Commission, by judicial proceedings, can secure a decision from the But, as we explained in The Outlook of February 17, the friends of railway rate regulation both in and out of Congress are divided in opinion, not on the question as to whether an appeal can be taken from the decision of the Inter-State Commerce Commission—for the Constitutional right to take such an appeal cannot be taken away by Act of Congress—but on the question whether that right should be explicitly recognized in the Act, and the proceedings in such appeal defined. Senator Knox has now introduced a bill already foreshadowed by The Outlook, which prescribes that an appeal may be taken to the Circuit Court of the United States; that from the decision of the Circuit Court appeal can be taken only directly to the Supreme Court, and that such appeal to the Supreme Court shall not act as a stay of proceedings. The proposed amendment further provides that-

No order of the Commission reducing a rate shall be set aside or suspended by an

interlocutory decree of the court without requiring a deposit of the excess charge or sufficient bond to secure to the parties entitled thereto the repayment, if the Commission's order is sustained, of all moneys received by the carrier in excess of the rate fixed by the Commission.

The attempt of certain partisan journals to make the public regard this as an attack on the President's policy is without foundation. The President has said nothing, publicly or officially, to indicate whether he is in favor of or opposed to this amendment, and there is in it apparently nothing inconsistent with the principles on which he has insisted. If the words "or sufficient bond," which we have italicized, were omitted, so that in order to delay the enforcement of the Commission's decision it would be necessary for the appealing railway to pay into the court the difference between the rate prescribed by the Commission and the rate maintained by the railway, we are inclined to believe that Senator Knox's amendment would expedite rather than delay the ultimate result. The Outlook is inclined to favor the Knox provision.

68

The almost unanimous The Pure Food vote (63 to 4) by which Bill the Pure Food Bill last week passed the Senate, uncrippled by serious amendments, shows that the sentiment of the country has made itself felt in Congress. The opposition to such a measure has all along been latent and dilatory; the attacks have been upon specific clauses rather than upon the broad principles involved; yet for some fifteen years efforts to carry through a National law protecting the whole people from injurious and fraudulent practices The bill now goes to the have failed. House of Representatives and should be pressed energetically to a vote; that it will be defeated on such a vote is most

improbable, but that it may be delayed and obstructed unless the press and the people urge Congress to action is only too likely. Great praise is due to the managers of the campaign of education lately carried on all over the country, and especially to such organizations as the General Federation of Women's Clubs and the National Consumers' League, which have treated the question as one of vital importance to all homes, and have taught graphically and by physical exhibits the shocking extent to which adulteration and misstatement are carried with both foods and drugs. It is true that many States have each a pure food law, but these are of varying efficiency and they can only punish offenses committed wholly in a State. The Heyburn bill which has just passed the Senate makes it a misdemeanor, under penalty of fine or imprisonment or both, to manufacture or sell adulterated or misbranded foods, drugs, medicines, or liquors in the District of Columbia, the Territories, and the insular possessions of the United States, and prohibits the shipment of such goods from one State to another or to a foreign country. Thus it would become illegal to ship or receive such goods in unbroken packages sent from one State to another, which can now be done with impunity, as the State laws do not then apply. It is not true, as has been widely asserted, that the bill would put arbitrary power in the hands of the Department of Agriculture. this point Mr. Heyburn in the final debate said: "This bill fixes no standard upon anything; it authorizes no officer to fix any standard. It provides that the courts, and the courts alone, may determine whether or not an article is contraband under the provisions of this act." The operation in actual practice would be that if the Department of Agriculture through its Chief of the Bureau of Chemistry should find that the law was violated, it would report the facts to the proper United States District Attorney, who would take action in a Federal court, and only after the court had found an accused person guilty would the article in question be publicly denounced or exposed. In brief, the bill undertakes two distinct objects, one being to prevent the sale of poisonous or injurious foods or drugs, the other to compel manufacturers to tell the truth about their products. Senator Heyburn has quoted a prominent physician as saying that not less than 200,000, perhaps 350,000, children lost their lives every year as the result of impure or misbranded drugs. If this estimate is only half-way correct, it would justify a far more drastic measure than that now before the lower House of Congress, which has been well defined as a bill to promote common honesty in the sale of foods, drugs, medicines, and liquors.

The Canal Report

The decision of the Administration in favor of a lock canal at Panama was in a measure forecast by The Outlook in its issue of December 2, 1905. The two reports from the board of consulting engineers were submitted to the Canal Commission, and the Canal Commission with practical unanimity, all the members except Rear-Admiral Endicott uniting, recommended the adoption of the lock plan. The grounds for their recommendation are thus summarized by themselves:

From the foregoing it appears that the canal proposed by the minority of the board of consulting engineers can be built in half the time and at little more than half the cost of the canal proposed by the majority of the board, and that when completed it will be a better canal, for the following reasons:

It provides greater safety for ships and less danger of interruption to traffic by reason of its wider and deeper channels.

of its wider and deeper channels.

It provides quicker passage across the Isthmus for large ships or a large traffic.

It is in much less danger of damage to itself or of delays to ships from the flood waters of the Chagres and other streams.

Its cost of operation and maintenance, including fixed charges, will be less by some two million dollars or more per annum.

It can be enlarged hereafter much more easily and cheaply than can a sea-level canal. Its military defense can be effected with as little, or perhaps less, difficulty than the sea-level canal.

This recommendation has been approved by the Secretary of War and by the President of the United States, and unless it is overruled by Congress, which is highly improbable, the Canal will be built with locks. The reader should remember that, while a majority of the board of consulting engineers recommended the sea-level canal, by a vote of eight to five, the question was not, when presented to them, a new one; and a majority of all the engineers, French and American, who have studied this subject, and reported upon it previously, are opposed to the sea-level and in favor of the lock canal. So that, while there is a real and important difference of opinion, on the whole it must be said that the weight of engineering judgment is in favor of the plan recommended by the Administration. The history which justifies this statement our readers will find in The Outlook of December 2, referred to above.

۹

The Coal-Carrying
Decision of
the Supreme Court

The Inter-State Commerce Commission against the Chesapeake and Ohio Rail-

way and the New York, New Haven, and Hartford Railroad, decided by the Supreme Court on the 19th of February, is the first cause instituted under the Elkins Act of 1903 and is now finally determined. The opinion is of special interest in view of pending legislation on the subject of inter-State commerce and the determined efforts of the Government to break up the practices denounced by existing laws. In the proceeding against the Chesapeake and Ohio Railway et al., the Government challenged the right of an inter-State carrier to perform a contract to sell and deliver merchandise (coal) whenever the price to be received by the railway is inadequate to cover its actual outlay, plus the published freight rates, upon the ground that the actual result would be discrimination and failure to collect the published tariff, in violation of the Inter-State Commerce Law. The railway companies maintained broadly that, when acting in good faith, they had, as dealers, the right to make contracts at a fixed price for sale and delivery extending over a series of years and then go into the market, buy the merchandise, and deliver it at destination, notwithstanding what they received therefor might not be sufficient to yield them a net sum equal to the published freight rate, according to which shippers generally were charged. The position of the Government was sustained and the

contention of the roads denied in a powerful and sweeping opinion delivered by Mr. Justice White, and the way now seems clear to enjoin carriers from resorting to arrangements or devices whereby, in effect, although indirectly, they may cut rates or practice discrimination. The opinion is an emphatic announcement of a fixed determination by the Court to construe liberally the inter-State commerce acts with the express purpose "to compel the carrier as a public agent to give equal treatment to all," and to refrain from those things which conflict with its duty to the public as declared by Congress, and, further, not to permit the doing by indirection of things unlawful if directly done. The Court deliberately laid aside consideration of other grounds upon which determination of the cause might have been founded, and entered upon a discussion of the broad underlying questions and principles, with the apparent purpose clearly to settle the law and announce its hostility to all those practices which contribute, directly or indirectly, to the evils which Congress intended to denounce. The result is far-reaching, and will be of great assistance to the Government in its efforts to compel carriers to recognize their duty to the public and confine themselves to the legitimate business of transporting for all on terms just and equal. The inter-State commerce acts prohibit the taking by a carrier of compensation greater than that specified in the published tariff as clearly as they do accepting less than required by the same. Since a carrier may not, therefore, as the net result of transactions as a dealer, make more or take less than the freight rate without violating the law, obviously its opportunities for dealing cannot be very extensive. Discussion of the principles involved will be found on another page.

(2)

The Insurance Committee's Report The New York Insurance Investigating Committee, after

nearly two months of continuous work since the close of its public sessions, made its report to the Legislature last week. The Committee, with Senator

William W. Armstrong as Chairman and Mr. Charles E. Hughes as counsel, began its public hearings on September 6, 1905, and held fifty-seven sessions before the end of the year. It collected an enormous mass of valuable testimony concerning conditions in the life insurance companies in New York State. report is a volume of three hundred pages, containing a comprehensive résumé of the testimony given at the hearings and the Committee's recommendations for remedial legislation. These recommendations cover the entire field of life insurance activity with great thoroughness; they deal with the organization and control of life insurance companies, investments, political contributions and lobbying, the regulation of expenditures, the ascertainment and distribution of surplus, publicity of accounting, and other more technical details. The Committee would permit the formation of either stock or mutual forms of insurance companies; it would allow the organization of purely mutual companies without capital stock, a form of company which under the present law can be created only by special enactment; it would permit the directors of a stock corporation to give its policyholders the right to vote for directors, and would allow the conversion of stock corporations into purely mutual companies if the parties in interest so desire. In the case of mutual companies the Committee recommends provisions which shall give the policy-holders the most ample opportunities to participate in the election of trustees. It would cancel all existing proxies, provide that all future proxies shall be valid for only two months preceding any given election, that lists of policy-holders shall be made accessible by the company, that nominations of candidates may be made by the administration, or by groups of one hundred policy-holders, but that such nominations must be made in the first case four months before the election and in the second case three months. the nominations not to be changed except in case of death or disability. company must send to each policy-holder a list of the nominations of the administration with the names of persons authorized to receive proxies to vote for such ticket; and, when all the nominations have been made, an official ballot containing the names of all candidates. The Committee would provide that the terms of office of existing directors shall expire on November 15 next, on the ground that present boards have been elected without the participation of any considerable number of policy-Such a provision would give the policy-holders an immediate opportunity to take an active part in the selection of new officials, if they so desire. On the important question of investments the Committee recommends that investment in the stock of any corporation be prohibited, as well as in bonds secured to the extent of more than onethird by the hypothecation of corporate All such stocks and bonds now held by the companies must be disposed of within five years from the end of this No loans shall be made on stocks or on this class of bonds. The Committee would also forbid all syndicate participations or transactions for purchase and sale on joint account, and would provide that no officer or director shall be pecuniarily interested in any way in any purchase, sale, or loan made by his company. The Committee recommends the passage of an unequivocal and drastic measure forbidding contributions by insurance corporations for political purposes, and making an official in any way responsible for such a contribution guilty of a misdemeanor. The pernicious activity of insurance companies in the endeavor to influence and control legislation the Committee would eliminate by a provision similar to that in the Massachusetts law. Every person employed to promote or oppose the passage of any legislative measure must file with the Secretary of State a statement showing on whose behalf he is working, and the matter with which he is concerned. The report of the Committee still further recommends legislation providing that every insurance corporation also must file with the same official, within two months of the adjournment of the Legislature, a statement showing in detail all expenses incurred in connection with legislation at the last session.

The Committee does Further not believe it advisa-Recommendations ble that the Legislature should attempt to prescribe the expenditures of life insurance companies for the purpose of eliminating extravagance in management. It finds that the most wasteful expense lies in the amount paid for new business. control this source of extravagance it is recommended that the amount of new business which a company may write be limited in the case of companies having more than a billion dollars of insurance in force to \$150,000,000 a year, and in the case of smaller companies to a certain prescribed percentage of outstanding business. Companies having less than \$50,000,000 of insurance in force shall not be limited. Such limitation would, in the opinion of the Committee, do away in great part with the excessive rivalry between companies which has resulted in extravagant commissions, supplemented by liberal bonuses and prizes, the maintenance of unprofitable foreign branches, and lavish expenditures in many directions for the purpose of inciting agents to their utmost endeavor. In addition to the limitation of the amount of new business that may be written, it is recommended that the amounts that may be expended in obtaining new business should be limited in accordance with a standard which is too technical for consideration in such a brief statement as can be given here. The practice of giving rebates on premiums is now stringently forbidden by law. A further amendment is recommended, however, providing that a person receiving a rebate shall be equally guilty with the one giving it. It is the opinion of the Committee that deferred dividend policies should be prohibited, and that dividends should be distributed annually, to be applied either in reductions of premiums or in purchase of additional insurance or to be paid in cash at the option of the insured. No change should be made under existing contracts, but all policies issued in the future should be of the annual dividend type. In order that the companies may have the most complete protection against fluctuations in the values of their securities and unforeseen demands, they should be permitted to accumulate and retain a reasonable contingent fund in addition to their legal reserve, the amount of such fund to be prescribed by law in proportion to the net value of the companies' outstanding policies. The Committee is of the opinion that mutual companies and stock companies transacting business on the mutual plan should be forbidden from writing non-participating policies. The Committee favors a provision for standard forms of policies for each of the ordinary sorts of life insurance. Any company should be privileged, however, to issue policies of any other kind, provided they have been approved by the Superintendent of Insurance. such case the Superintendent should establish a standard form for that type of insurance which all companies would be free to use. Perhaps the most important recommendation of the Committee is that with regard to publicity and State supervision. It would provide for the fullest and most definite reports to the Superintendent of Insurance of all the financial transactions of an insurance company, in a form to be prescribed by the department. The Committee includes in its recommendations a number of categories under which such reports should be made in order to afford the most complete publicity to all of the activities of the insurance companies.

(2)

As The Outlook pointed New Subways out last week, there are in New York two bills before the New York Legislature regarding the new subways which are to be built under the direction of the Rapid Transit Commission. These are known as the Elsberg Bill and the City Club Bill. Both of them seem to us to be defective in certain particulars, and the Legislature would, in our opinion, be serving the best interests of the city if it postponed action without passing either of the bills in their present form until it can be convinced as to what are the real public interests involved. There are certain principles behind the question of city transportation which The Outlook has often pointed out before, but which ought

to be repeated at this crisis. 1. The representatives of the people are under no circumstances to surrender the ultimate control of the highways-whether subways, surface ways, or elevated ways -to private corporations; and they are by every legal means to endeavor to re-acquire that control in those cases in which it has been lost. For example, the Legislature might refuse to give a franchise to any corporation to operate a subway if it now has a permanent franchise to operate a surface or elevated way, except on condition of the surrender, for a consideration, of the present franchise. 2. When the public has possession of a highway or highways, it should intrust the administration to a small body of men with large powers. There are three perils to municipal owner-They come from honest conservatives educated in the school of individualism; from selfish interests, sometimes but not always corrupt, which wish to get control of the streets for private property; and from incompetents (generally radicals) who have never been able to manage their own business and so suppose that they can manage the business of a great city. To guard against this threefold peril we need for the control of the streets a small body of men who are able, honest, publicspirited, and cautious. Our present Rapid Transit Commission appears to The Outlook to be too cautious, but it possesses the other requisite qualities. 3. Given such a body of men, it should not be allowed to bind future generations, and therefore should not be allowed to grant a franchise or make a contract for a period of more than, say, thirty-five years. But, with this and perhaps some other analogous limitations, it should be given a free hand. As far as possible, it should be a stable and non-political body. 4. The distinction between ownership and operation should always be kept in mind, because the public ought to get and can get for public ownership and private operation the support of men who would at present prefer private ownership to public operation. These principles appear to us to be fundamental, and are as applicable to St. Louis and Chicago as to New York. It

is in accordance with these principles that we object to the City Club Bill, because it permits perpetuity of franchise and allows the Rapid Transit Commission to bind future generations by its contracts; and that we object to the Elsberg Bill, because it is not clear whether its instructions to the Rapid Transit Commission are permissive or mandatory, and therefore it is not un reasonably suspected of attempting to bring about public operation by indirect methods.

Two bills have been in-

troduced into the New

Making Spoils of the Children

York Legislature by Mr. Tompkins, of the Assembly, which ought to arouse the protests of the press as they certainly would the protests of the parents if the nature and effect of these bills were generally understood. Under the present law the twenty-six district superintendents are appointed upon the nomination of the City Superintendent and his associates—that is, the expert officials who are charged with the supervision of the educational system are charged with the duty of nominating their assistants. This right of nomination one of Mr. Tompkins's bills takes from them, leaving the Superintendent and his associates without any voice in the selection of their own assistants, on whose loyalty the Superintendent must necessarily depend. We can conceive no argun.ent for this change, and no reason for it except a desire to give the Board of Education unrestricted appointing power for political purposes. present the teachers are selected by a board of examiners consisting of the Superintendent and four persons appointed by the Board of Education on the nomination of the Superintendent, and their terms expire in successive years, so that the examiners cannot well become the instrument of a faction. Mr. Tompkins's bill gives the appointment of this board of examiners to the Board of Education without qualification. The effect of this bill is to deprive the Superintendent of all real power in the selection of the teachers or even the

determination of the standards for their

qualification, and its effect if not its

object can only be to put the appointment of the teachers into the hands of a nonexpert body which may easily be made a partisan political body. Like the judiciary, the public school system of the United States must at all hazards be defended against partisan politics. Its value depends as much upon its nonpolitical as upon its non-sectarian char-Mr. Tompkins's bills appear like an attempt to make political spoils of the public schools of New York City. The people have put into the care of the State the training of their children; they have thus reposed in the State a most sacred trust. To use this function of public education for the purpose of furthering any interest except that of the children is to commit a betrayal of trust. If the Superintendent of Schools is not competent, he should be removed; but no personal hostility to him can justify taking from the non-political executive head of the school system powers which belong to his office and which are indispensable to his successful discharge of his duties, and giving them to a body whose functions are essentially legislative, and whose constitution and the method of whose appointment are such as to afford no guarantee against its use of its powers for political or personal ends.

₩

The Fight Against Race-Track Gambling

After eleven years of torpid toleration of an iniqui-

tous statute legalizing race-track gambling in defiance of the ground law of the State forbidding it, the conscience of the people of New York has at length been pricked by the enormous scandal of it into an effort to abolish it. The State Constitution, as amended in 1894, contains these words:

Nor shall any lottery, or the sale of lottery tickets, pool-selling, book-making, or any other kind of gambling hereafter be authorized or allowed within this State, and the Legislature shall pass appropriate laws to prevent offenses against any of the provisions of this section.

Nevertheless, the Legislature of 1895 enacted the so-called Percy-Gray bill, whose ostentatious veneering of prohibitions against gambling concealed devices for its protection. The Court of Ap-

peals has ruled that, as distinguished from a prize or a premium, a "stake" is a money bet. But this word "stake" was tacked by the bill to the "purses, prizes, and premiums" to be raced for, and thus the law stands now. Under the control of the racing commission which the Legislature established, at whose head is, or was, Mr. August Belmont, eight licensed race-tracks enjoy a monopoly in gambling of the rankest kind, in whose profits the agricultural (county fair) associations share. In 1904 the receipts of the licensees were \$3.805.126. of which the associations drew five per cent. The other side of the story is told by the Rev. T. F. Chambers, for eleven years pastor of the First Baptist Church in Saratoga:

In former years we were wont to welcome a fair proportion of respectable visitors . . . now they scarcely count. The month [of August] here stands for lawlessness and vice. Our streets are full of vile men, and women equally vile or viler, and we are the prey of the unclean and the degraded. . . . Many of the young men of the village have fallen in the last decade. . . . Some of them are members of my own church, or were. . . . The iniquities of our great hotels are an old and well-known tale. . . . Our track is a nuisance, a misery, a shame, a disgrace, and a curse.

What Mr. Belmont's racing commission cares for morals as compared with horses now appears. Police power within its inclosures has been granted to it by the Within are the bookmakers and pool-sellers, who attract the crowd of dupes and rascals. For their privileged stand within they pay from five to eight thousand dollars per day, and securely ply the business which, outside the gate, incurs fine and imprisonment. New York has suffered is imminent in New Hampshire, where the Legislature of 1905 was hoodwinked into chartering the same iniquity. Dummy incorporators having formed the "New England Breeders' Club," men who are or have been active in the sort of scheme that has cursed Saratoga quickly took control as their "associates and successors." In rural Salem on the Massachusetts border, hard by populous manufacturing cities, they have been spending a great sum in creating a center of moral pollution identical with those existing here.

Their charter is modeled upon the New York statute, and their president writes: "We intend at Salem to proceed on these lines." To thwart this the decent people of New Hampshire, led by such men as President Tucker, of Dartmouth, are now struggling. Victory in New York will help them toward victory.

The 'equalization of Equal Taxation in taxes by requiring New Jersey railways to pay taxes

on their property in the same way as do other property-owners is a question that has been agitated in New Jersey for some years, and within the last year or two has been pressed toward solution by political reformers and dissatisfied taxpayers. Last week what is known as the Perkins bill passed the Assembly, and press reports indicate that it will probably be accepted by the Senate. It does not accomplish everything desired by radical reformers, but it is a long step in the right direction, as may be seen from the statement that under it the amount of taxes to be paid by the railways would be increased by three hundred per cent., or, as one speaker in the debate declared, by five millions of dollars a year. It has been almost universally agreed that the system hitherto enforced in New Jersey for taxing railways has been anything but equal. Their property has been assessed by a special board of assessors, and the amount raised has been paid into the State treasury, but has been largely used for school purposes, and thus, in a way, has been distributed. It is maintained by many that the property of railways should be taxed by towns precisely as other property is taxed; that the portion of the roadway (or section of the main stem, as it is called) lying within a certain town should be assessed and taxed by that town just like any strip of land of the same dimensions, and that the same should be done with regard to what has been called the second-class property of the railways namely, any property not a part of the main stem lying in the town. On the other hand, it has been urged that this would give too large a proportion of the railway taxes to the large cities. The

Perkins bill, as originally drawn, provided that the main stem property should be taxed at the average State tax rate by the State board of assessors and the tax paid to the State for general purposes; as amended, it provides also for the taxing of second-class property in each taxing district by the local assessors at the local rate. The issues in this general question are somewhat intricate and have apparently been purposely complicated by politicians and railway advocates. The Perkins bill, however, is indorsed by Senator Colby and Mayor Fagan, who have been leaders in this reform, and its passage is a distinct triumph for the main contention that railways should not be put upon a separate and favorable basis as regards taxes, but should bear their share of public expenses.

The special ses-Pennsylvania's Excellent sion of the Penn-Legislation sylvania Legis-

lature called by Governor Pennypacker shortly after the November election adjourned on February 15, after making a record remarkable not only in the annals of Pennsylvania politics but in the history of American legislation. The same body which at the regular session of 1905 passed the "ripper" legislation and proved adamant to all suggestions of improvement in election laws and in other directions, passed a series of bills giving force and effect to the reform sentiment and demands of the State. Every item of the Governor's call for the special session received attention in the shape of a legislative enactment, with the single exception of the State Civil Service Bill. This is the first time in the history of Pennsylvania that a special session accomplished the purpose for which it was called. The work done at the session was of two classes—the undoing of things which ought not to have been done and the doing of things that ought to have been done at the regular session. In the first class comes the repeal of the Ripper Bill and in the latter come the passage of the general reform measures. The record of the session includes the passage of the following bills: Greater Pittsburg Bill, Senatorial and Represent-

ative Apportionment Bills, the Roberts Corrupt Practices Act, the Sheatz Personal Registration Bill and Uniform Primary Acts, the Jackson bill regulating the deposits of State funds and the conduct of the office of State Treasurer, the bill fixing the salary of the Insurance Commissioner at \$6,000 in lieu of a \$3,000 a year salary and fees, the bill fixing the salary of the Secretary of the Commonwealth at \$8,000 a year in lieu of \$6,000 and fees, the Philadelphia Civil Service Bill as championed by Mayor Weaver, the bill making a new salary schedule for the Insurance Department; the Shern bills, one restricting political activities of municipal employees in Philadelphia, the other prohibiting municipal employees from soliciting campaign funds; the bill limiting to \$750,000 the annual expenditure for State bridges, and the third-class city personal registration bill.

•

The reapportionment bills What the have righted the injustice New Bills Do of a quarter of a century, and represent a compliance with Constitutional provisions long ignored. Sheatz Personal Registration Bill passes substantially as prepared by the election reform element of the State and as introduced by Representative Sheatz. This bill at the regular session was not reported from committee until the last day of the session, and so killed. The Sheatz Uniform Primary measure, while not so complete and satisfactory in form and provision as prepared by the Committee on Election Laws, still represents a very great advance in the matter of primary legislation, in that it provides for uniform primaries for all parties on the same day, and places the administration of the law in the hands of the regular election officers, who are responsible to the officers of the State. It provides for separate party ballots, which an elector can have upon request and complying with the fairly simple basis of party standing. The new Political Assessment Bill provides that no officer, clerk, or employee in the government of any city of the first class (Philadelphia) shall demand, solicit, collect, or receive, or be in any manner concerned in demand-

ing, collecting, or receiving any assessment, subscription, or contribution, nor shall any such officer, clerk, or employee give any contribution intended for any political purpose to any person, corporation, committee, or association. The Roberts bill, patterned somewhat after the law in England, aims to prevent corruption by means of publicity. It places no limit upon a candidate's expenditures, but it does provide that he must under oath make out his campaign expenses. It relates to all candidates for office, and, that there may be no dodging of election expenses, it defines them to mean all expenditures "of money or other valuable things in furtherance of the nomination of any person or persons as candidates for public office, or any furtherance of the election of any person or persons to public office or to defeat the nomination or election to public office of any person or persons." It further requires that all expenditures must first pass through the hands of the treasurer of the committee, who must account for every expenditure made. The Shern bill is designed specially to take police out of politics, and forbids any employee of Philadelphia to be a member of any political convention, except in the performance of his political duty, or to serve as a member of or attend a meeting of any committee of any political party or take any active part in political management or in political campaigns.

Surely, as the Philadel-Comment on the phia "Press" declares, Results "These are large results. No one at the beginning of the session would have dared to predict an outcome so comprehensive and satisfactory. No measure has been passed that any good citizen can deplore, and nearly every act will have a far-reaching and lasting effect." The "Ledger," in commenting upon the resolution of thanks passed by the Legislature and sent to Governor Pennypacker for his patriotic action in calling an extraordinary session, declares: "The Governor deserves these thanks and the thanks of all the people of Pennsylvania." He had the wisdom

to perceive the significance of the popular revolt against corruption and graft and the duty of immediate compliance with the just demands of the people of the State. Even he did not at first contemplate so broad a programme as has been carried out. To suggest to this Legislature the most sweeping measures of non-partisan reform seemed visionary, but the response to his summons was such as to open up the wide opportunity which the Governor recognized in his second call. The Governor himself, in a special message to the House and Senate and in a personal letter to each member thereof, declared:

We have reached the end of what has proven to be a most important session of the General Assembly of this State, and I congratulate you most heartily upon the success which has attended your efforts. You have risen above the desire to influence personal interests, and have had regard in what you have done for the welfare of the commonwealth. This session will long be remembered as an example of what can be accomplished when men are inspired with such sentiments. You have made an earnest effort to solve the difficult problem of apportionment, and the legislation you have enacted will do much to place upon a higher plane the administration of public affairs in this State. Such achievements will deserve and receive the commendation and appreciation of all thoughtful citizens.

•

Municipal Reform in Philadelphia Another notable victory for good government was won by

the people of Philadelphia at the municipal election, February 20, when the fusion forces carried the city by a majority of 10,000. While this represents an apparent falling off of interest from the November figures, in that election great excitement prevailed, sensational developments and disclosures folowed one another, the Mayor was an active campaign speaker, and the whole force of his administration was actively applied to the fusion candidates. the February election there was no excitement, no sensations; the Mayor very properly took the ground that his obligations were not in the direction of conducting campaigns, but to give the best possible administration; so, while his sympathies were with the City party-

Democratic candidates, there was no such active co-operation as in November. Moreover, in the campaign just closed, the only city officers to be elected were two magistrates, and as both candidates were sure of election, one to represent the majority, one the minority, interest was expected to be very slight, especially as in a number of wards only school directors and election officers were to be chosen. The reform leaders very properly refused to make any definite preelection forecasts; but the results showed how thoroughly aroused the people really With a minimum of active interest, a very small campaign fund (less than ten per cent. of that raised in November), with many active workers who had aided fusion through the Lincoln party column in November returned to the Republican ranks, the electors quietly went to the polls and registered another rebuke to the old forces, and showed in an unmistakable manner their independence and determination to place Philadelphia's government on a permanently higher plane. A number of thoroughly good and representative men were elected to Councils, and both branches of the local legislature may now be depended on to support Mayor Weaver and to represent the best interests of the city. Efficient and honest election officers who will serve at the gubernatorial and mayoralty elections were also elected.

The election of George W. Pittsburg's Guthrie, a Democrat, as **Election** Mayor of Pittsburg (who will, by virtue of the new law, be the first Mayor of Greater Pittsburg) is another significant event. It represents the triumph of principle, integrity, and independence over the forces of predatory wealth and business politics. It indicates, as the New York "Tribune" points out, "the purpose of the voters to assert their power and to compel a return to popular and honest govern-A new force has been liberated which promises the elimination of oldtime abuses and the attainment, generally, of a higher level of citizenship and government." Mr. Guthrie is one c the best types of the useful American citizen

With a strong penchant for politics, he has never allowed prospect of office or preferment to beguile him into "unholy alliances." In 1896 he was the fusion candidate for Mayor of Pittsburg, and many believe he was elected, although the returns were manipulated to produce a different result. He has always been an active reformer, and as attorney he has helped time and again to protect the city's best interest. He has been actively identified with the National Municipal League, serving on its principal committees, also with the Election Reforms Committee of Pennsylvania, and was a member of the committee which drafted the recently passed personal registration and uniform primary laws. In short, he has been a conspicuous supporter of every forward political movement in his city and State, and has been an active factor in the National movements making for higher standards of citizenship and administration. It was reported that Mr. Guthrie would be the Democratic candidate for Governor. He has disposed of this suggestion in a characteristic way:

"I am not and will not be a candidate for Governor on any ticket. I will not permit the use of my name as a candidate, and, if I live, will serve out my term as Mayor of the city of Pittsburg. I expect to support my party's nominee, but I accord to every man connected with the city government the same right—and that is, to support the party to which he is attached. There will be no political machine constructed in Pittsburg during my administration, whether it be Democratic or otherwise. I have repeatedly said that no man under me need feel that his position depends upon political service. I will issue no political orders myself, nor will I permit department heads or bureau heads or foremen to issue orders. The time for such outrageous methods is going by rapidly."

outrageous methods is going by rapidly."
Mr. Guthrie was asked: "Are you aware that a majority of both branches of Councils will be Republican, at least during the first

two years of your administration?"
"That fact makes no difference to me," he replied. "Councils will do what I ask of them, because I will ask nothing that is not honest, reasonable, and fair."

St. Louis's Protest
Against Chicago Overruled

legal proceeding was that given by the
Supreme Court of the United States last

week concerning the right of the city of Chicago to turn its sewage into the Mississippi River above St. Louis through the medium of the newly constructed Sanitary District Canal and the Illinois River. The suit was brought in the name of the State of Missouri against the State of Illinois, the Supreme Court having original jurisdiction because the litigants were States. The real parties in interest were the city of St. Louis and the city of Chicago. Chicago has built a drainage canal, designed to be a part of a great waterway in the future, connecting Lake Michigan with the Illinois River. Through this canal the sewage of Chicago, which formerly polluted Lake Michigan, the source of Chicago's water supply, is diverted into the Illinois River and thence into the Mississippi River and the Gulf of Mexico. St. Louis protested against this action as tending to pollute the Mississippi River, the source of her water supply. Chicago's answer was that there was no pollution at St. Louis; that running water purifies itself, and that by the time St. Louis was reached all harmful elements had disappeared. Chicago even contended that turning a large amount of Lake Michigan water into the Illinois River, along with the sewage, really tended to improve the quality of that otherwise sluggish stream. The Supreme Court took Chicago's view of the matter. It held that there was no evidence that the water was polluted as far away as St. Louis, a distance of 357 The Court said: miles.

There is no pretense that there is a nuisance of the simple kind that was known to older common law. There is nothing which can be detected by unassisted senses—no visible increase of filth, no new smell. On the contrary, it is proved that the great volume of pure water from Lake Michigan which is mixed with the sewage at the start has improved the Illinois River in these respects to a noticeable extent. Formerly it was sluggish and ill-smelling. Now it is comparatively a clear stream, to which edible fish have returned. Its water is drunk by fishermen, it is said, without evil results. The plaintiff's case depends upon the inference of the unseen. It draws its inference from two propositions. First, that typhoid fever has increased considerably since the change, and that other explanations have been disproved; and, second, the bacillus of typhoid can and does survive the germ and

reach the intake of St. Louis in the Missis-sippi.

There has been some increase in the number of typhoid cases in St. Louis since the drainage canal was opened, but the Court declared that there was no proof that the increase was due to sewage from Chicago, and cited the fact that there had been no such increase of typhoid cases along the Illinois River. There were other possible sources of typhoid contamination nearer at hand, and the Court intimated that St. Louis probably would have to seek relief through some system of filtration which would protect it from all sources of contamination. The Court stated that if it were to prevent Chicago from diverting its sewage into the Illinois and Mississippi Rivers it would later no doubt be obliged to exercise a like restraint upon St. Louis, which herself discharges sewage into the Mississippi River. While deciding the case at issue, on the evidence presented, in favor of Chicago, the Court stated that it would rule in favor of St. Louis if the case should be reopened and a presentation of facts should be made clearly sustaining the contention of St. Louis. It is a fact upon which much stress is laid by Chicago that fish have appeared, since the opening of the drainage canal, in portions of the Illinois River where formerly none were to be found.

☻

The German-American Germany and America are ultra-protectionist countries. At

present it would be hard to get the parliaments of either Power—the Reichstag or the Congress—to pass a low-tariff act. Germany, having passed a hightariff law, to take effect March I, has been vainly endeavoring to induce our Government to negotiate a reciprocity treaty if we would take advantage of the minimum rates of the new treaty. But there is no chance just now of its approval by Congress. It had been suggested, however, that Germany would gladly offer corresponding advantages if we modified some of our customs regulations and proceedings. Accordingly, a conference was held a fortnight ago, at which

certain concessions were decided upon. While rejecting the application of German importers for open hearings in cases of contested valuations of German goods (because American importers would be restrained from testifying freely if confronted by representatives of great German trade interests, who would be in a position to injure their business), the rule was somewhat relaxed by an amendment authorizing the Board of Appraisers to determine for themselves in each case whether hearings should be open or closed. A second change in the regulations making them more acceptable to Germans is one directing our consular officers in Germany to consult with local boards of trade in reference to the price of goods to be shipped to America, the possibly prejudiced opinions of the boards of trade on these questions of course not being conclusive but only advisory. third and more important concession is that invoices hereafter shall be consummated at the place where the goods are manufactured and not at the port of shipment as at present, but that to the invoice valuation there shall be added the cost of carriage from the place of manufacture to the port of shipment. These changes have apparently afforded a sufficient basis for a request to the Reichstag from the Imperial Chancellor, Prince von Bülow, to suspend for fifteen months the application of German maximum rates to our goods. The bill was promptly passed by the Reichstag and also by the Bundesrath, or Federal Council. The real reason, of course, for granting minimum rates to us is not to be found in the slight changes made in our customs regulations, but in the recognition by Germans that in the alternative, a tariff war, Germany would suffer more than we Not only would she pay more for breadstuffs, but in the event of our imposition of a retaliatory tariff above the present Dingley rates she would lose most of her valuable export trade to America, exceeding a hundred million dollars a year. American exports to Germany, on the other hand, considerably exceed two hundred millions. Even by the minimum rates of the new German tariff America will suffer from in-

creased duties on agricultural products, cattle, and manufactured goods. But cotton and copper (absolute necessities to German manufacturers, and representing about half our exports to Germany) remain on the free list. It would seem unlikely that they should be removed therefrom. Thus, if a fiscal war with Germany must be ultimately waged, we have the prospective assurance of knowing that the latest ultra-tariff maker will suffer more than we, who have also gone too far in that direction. This. however, should by no means blind us to the value and significance of the discrimination just made in our favor. It is another witness of the desire of the German Emperor and the German people to win the good will of America. should—and we believe it will—be followed by a reciprocal feeling here.

٠

In accordance with Liberal Government custom, the Lord in England Chancellor of England last week, on bended knee, handed to the King an address which his Majesty read to the new Parliament, thus fitly completing its opening ceremonies. Edward VII. read this "message" as if it were his own. It was really the new Ministry's message. The official on bended knee was the representative of the governing power in Great Britain. The King's Speech was notable. First, he formally recognized that the negotiations resulting in the "honorable peace" between Japan and Russia were "due to the initiative of the President of the United States." Next, the King's hope that the result of the Algeciras Conference " may be conducive to the maintenance of peace among all nations" may possibly be taken as an admission that the Moroccan situation really threatened the peace of Europe. Thirdly, turning to colonial affairs. the message announces the stoppage of importations of Chinese laborers into the Transvaal until the new Government of that colony can deal with the question: for both the Transvaal and Orange River Colony are to have broad constitutional governments; they are to be no mere Crown Colonies.

Furthermore, the question of colonial

preference is deferred by the postponement of the proposed Colonial Conference until next year, while the warnings and pleadings of protectionists are met by a statement from the new free-trade and Liberal Government that both exports and imports are steadily increasing. Finally, as to Ireland, a promise was made of administrative improvement; definite proposals are now being considered to effect changes in the government of Ireland. A day later, as an amendment to the Address in reply to the King's Speech, Colonel Saunderson, a Conservative, moved an expression of alarm, believing that "his Majesty's Ministers have committed themselves to a policy which will endanger the liberties and property of the loyalist minority, promote discord in civil life, and impair the integrity of the United Kingdom." This amendment, the first test of the new Government's strength, was rejected by the enormous majority of 406 to 88. The vote was taken after a stirring speech by Mr. James Bryce, Chief Secretary for Ireland, who remarked that the late Government itself had admitted the necessity for large changes in Irish administration, that the present Government would make an effort to improve the Irish government system and to associate the people therewith. For this the country had given to the House of Commons a mandate. No constitutional government could afford to overlook Ireland's demand. Mr. Bryce declined, however, at present to outline the Government measures indicated in the Speech from the Throne.

Chinese Unrest

Chinese Unrest

Chinese Unrest

Chinese Unrest

Chine's latest reform scheme has been to transform the historic literary examination halls in Peking into a military school. The surprisingly fine record made at the recent army maneuvers by the thirty thousand soldiers—three-quarters of the army already recruited in the metropolitan province of Chili—has inspired the Chinese authorities to redoubled efforts, not only in that province (as is seen by the event above mentioned), but also in many others. In the provinces of Hunan and Hupe, for

instance, similar governmental enthusiasm and energy exist, as is noted by the merchants and missionaries whose headquarters are at Hankau, "the Chicago of China." There is no question about the fact that the Imperial Government is arming to protect itself. Its object, however, is not so much to guard itself against foreigners as against anti-Manchu revolutionists. The present Manchu dynasty has never quite conquered the pure Chinese. Sir Chentung-Liang-Cheng, the Chinese Minister at Washington, declares that the main object of the political agitation in China by revolutionists, especially in the south, is to bring about international complications with the view of crippling, if not wholly destroying, the Manchu dynasty. opinion is confirmed by a well-known missionary who has just arrived in this country; he declares that the trouble now brewing in China is ultimately and often directly attributable to a deepseated and unconquerable popular antipathy toward the Government; that this feeling is spreading, and that the anti-foreign sentiment is merely one of the expressions of an anti-dynastic movement (though the boycott on American goods has had its special cause). It is only natural, we think, that the educational progress in China, increasingly evident during the past eight years, should find its foe in any reactionary government resting on ancient and outworn traditions. The Empress Dowager, and Yuan-Shi-Kai, the most influential of the Viceroys, were once both reactionaries, but have, since the interference of the allied Powers in 1900, shown unmistakable and gratifying signs of more liberal sentiments. But, despite these and other welcome changes, the imperial government still stands too considerably for the negation of progress. The people realize this as never before because of the return of many of the thousands of students who went to Japan for their education; they, bring back Japanese ideas as to a progressive governmental administration which shall be backed up by all the people; and, being mostly members of the better classes, their sharp criticisms of the Chinese system are largely responsible for the growth and propagation of nationalistic, anti-dynastic, anti-foreign, and boycott sentiments. It is reassuring to think that the anti-foreign feeling is not directed towards the missionaries as much as has been supposed. The Presbyterian, Methodist, and Episcopal Missionary Boards have received tidings from their agents at Tientsin, Shanghai, Fuchau, and elsewhere, stating that the missionaries were in no actual peril. But, on the other hand, on Monday of this week news came that American mission stations at Nanchang in the province of Kiangsi had been destroyed, and that, although the missionaries escaped, a family of four English people had been killed.

☻

In Austria a German Universal Suffrage minority has long in Austria-Hungary been able to outvote a Slav majority; in Hungary a Magyar minority has long been able to outvote a majority composed of other elements. The action of the Emperor Francis Joseph last week should properly readjust electoral conditions. In the Austrian Reichsrath, or Parliament, at Vienna, through the Premier, Baron Gautch von Frankenthurn, the Government's plan was introduced in several bills presented on the same day, providing that every Austrian twenty-four years old and domiciled in a constituency for at least a year should be entitled to vote, and that every Austrian holding citizenship for at least three years should be entitled to election to the lower house of the Reichsrath. Plural voting is prohibited, and a division of electoral districts is designed so as to give to the Germans 205 representatives, to the Slavs 230, to the Italians 16, and to the Rumanians 4. As might have been expected, the Premier's explanation of the Government's plan was subjected to noisy interruptions from many Pan-Germans; most of the deputies, however, heartily applauded his speech. In the Hungarian Parliament at Budapest a more dramatic scene occurred, due to the failure of the Emperor-King's efforts to form a government from the parliamentary majority. The leaders of the majority declined to

form a Cabinet unless Francis Joseph decreed that Hungary might make a commercial treaty with foreign countries independently of Austria, and also that the language of words of army command should be Magyar (or Hungarian). Emperor, as King of Hungary, naturally could not see his way to granting either of these demands without disrupting the Dual Empire. In order to obtain a parliamentary majority favorable to his views, he dissolved Parliament, and, appealing to the country, offered practically universal suffrage, on apparently similar terms as in Austria. Nearly sixty years ago Louis Kossuth commanded the world's sympathy in a popular struggle against the then young and reactionary Francis Joseph. To-day the world's sympathy may be rather with that now venerable monarch and against Francis Kossuth, the able son of Louis Kossuth, and one of the most influential of the leaders of the parliamentary majority.

The Reform of Insurance

The power of public opinion in effecting political and social reforms has had few more striking illustrations in this country than is found in the report of the Armstrong Investigating Committee, which has just been made public. three greatest life insurance companies in the world—and they were also, it may be said, the three greatest private financial corporations in the world—were doing a successful, highly profitable, and thoroughly solvent business in all parts of the world, with their headquarters in the city of New York. They were paying large death claims annually without hesitation, they possessed splendid lists of assets in gilt-edged stocks, bonds, and real estate, and any man who held in one of these three companies a paidup or even partially paid-up policy regarded himself as the fortunate possessor of a security as unquestioned in its value to his estate as a government bond. Out of a private quarrel arising in one of these three companies, over the question as to what individual or group of individuals should control its affairs, its cash, and its vast accumulation of stocks and bonds, little by little grew a public scandal. It was discovered that the trustees of these great corporations, who were chosen to manage their trusts for the benefit of the policy-holders, were in reality conducting the corporations primarily for their own financial benefit, and only secondarily for the benefit of the real owners. The Armstrong report is the first fruit of less than a year of public agitation, discussion, and inquiry, and to our mind it is a distinct demonstration that there is in America such a thing as Public Opinion, which can think clearly and express itself effectively through its legislative representatives.

Although the report is presented to the Legislature of the State of New York, it is really a document of National importance. Its masterly understanding of the details of life insurance, its clear and simple style, the dispassionate and yet direct and convincing tone in which it is written, and the constructive and practical character of the remedial legislation which it proposes, will give it permanent value as a public dcoument on a subject of vital interest to thousands of men and women. While it is radical and drastic, it is quite the opposite of socialistic in the destructive sense of that word. It is the work of those who desire to build up and strengthen, not to tear down and weaken, the achievements and prestige of American financiers. Whatever honest criticism may be made upon the details of the Committee's recommendations, for its work as a whole there is nothing but praise. Its Chairman, Senator Armstrong, and its chief counsel, Mr. Charles E. Hughes, deserve the National reputation which they have won for ability, persistency, and singlemindedness in pursuing an impartial investigation in the face of extraordinary technical difficulties. Their work was carried on, moreover, counter to the prejudices and influence of powerful corporations, and the personal pressure brought to bear by unscrupulous and selfish capitalists and politicians. Nobody will ever know, probably, how really terrific the pressure of this kind was, but it is easy to imagine it. The report, therefore,

not only reflects the ability and skill of Mr. Hughes, Senator Armstrong, and the Committee, but redounds to their honor.

On another page we give in some detail the recommendations of the Committee for the legislative remedy of insurance abuses. These remedies are grouped under sixteen heads, and as they are proposed for the consideration and debate of the Legislature, it follows that they are not to be accepted by the public without careful consideration and discussion. Some of them, however, it appears to us, ought to be taken without controversy as the foundation for any just and effective legislation. Nothing is insurance which does not really insure. It is a truism, therefore, that security for the policy-holder must be sought for and maintained, first, last, and all the time. Such security depends, it seems to us—

I. Upon publicity. The uncovering of financial abuses and mismanagement during the past year in the insurance field is due to publicity. It is true that this publicity sprang from private initiative. Legislation ought to provide that hereafter it shall spring from public initiative. The Committee recommends under this head a much more thorough and comprehensive system of stating annually the assets and liabilities of insurance companies, their commissions, expenses for legislation and other legal work, salaries, death claims, profits and losses, and investments in bonds or real estate or other securities. Upon the method by which a thorough and plain public knowledge of the affairs of their company may be obtained by the policy-holders depends, it seems to us, the efficiency of all other reforms.

II. Next in importance to the provision for publicity comes the provision for mutualization. Some means must be found by which the policy-holder may have an influential if not a dominant voice in the management of his company. The Armstrong Committee recognizes this by providing a plan for an effective ballot protected in such a way that each policy-holder may vote for the board of directors. The Committee does not appear definitely to discountenance stock life insurance companies, but it does

unquestionably favor the mutual plan and the empowering of policy-holders to elect their own directors. It has been objected that if policy-holders have this right they will not exercise it; but a man who can be persuaded of the value of life insurance and the necessity of paying an annual premium can also be persuaded of the necessity of casting an annual ballot to protect his accumulated premiums.

III. If insurance management can be reformed by upright legislative enactments, it can be corrupted and destroyed by purchasable legislative action. The next step, therefore, after assuring publicity and mutual control, is to prohibit by criminal statutes both the payment of campaign contributions and the maintenance of paid and irresponsible lobbyists. The Committee's recommendations in this regard need simply to be stated in order to be adopted without further discussion.

IV. The foregoing reforms will become dead letters unless the State Superintendent of Insurance is not only an honest man, but a man of strong enough character to resist the personal pressure which great corporations can always bring to bear upon such an official. Legislative steps should be taken to strengthen both the system and the personnel of the State Insurance Department. Whether the Superintendent of Insurance should be an appointed or an elective officer is a question for debate, but that he should be a responsible officer is undebatable. For, as the Armstrong report expressly says of the State Insurance Department, "most of the evils which have been disclosed by the investigation would have been impossible had there been a vigorous performance of the duties already laid upon the department, a vigilant watchfulness in the interest of policyholders, and a courageous exercise of the powers which the statute confers."

If the recommendations made to the Legislature under the four heads which we have outlined are adopted, the basis will be laid for a far-reaching and muchneeded reform of our insurance system. The other recommendations of the Committee are fair subjects for discussion which cannot be entered upon here at

the present time. They involve investments, limitation of business and expenditures, rebates, and the distribution of These we propose to consider surplus. hereafter.

1906

After all, the vital thing is to remember that legislation never made an honest man, as it has never made a temperate man. Statutes, laws, and prohibitions may check dishonesty and protect the victims of thieves, embezzlers, and grafters, but it cannot create honor, unselfishness, and scrupulous regard for the rights and advantages of others. A righteous education that makes every man feel that stock-jobbing, railroad-grabbing, corporation-looting, and the selling of valueless securities to unsuspicious purchasers is as mean and contemptible as cruelty to children is the only means by which the country may rid itself permanently of the types of financiers and politicians whose corruption and dishonor are recorded in the Armstrong report.

The Supreme Court on Railway Regulation

When the United States Supreme Court reached, by the narrow majority of five to four, a decision in the Northern Securities case, The Outlook expressed, respecting its decision, the following judgment: "In our opinion, the chief value of the Supreme Court decision in the Northern Securities case is not that it prevents the consolidation of two competing railways, but that it paves the way to Governmental regulation of those railways after they shall have been consolidated; not that it cures a particular abuse of corporation powers, but that it establishes more firmly than ever the sound political and industrial doctrine that corporations deriving their existence from the hands of the people must submit to regulation by the people "(March 26, 1904, p. 727). This judgment is equally applicable to the decision of the Supreme Court rendered with unanimity last week in the case of the Inter-State Commerce Commission against the Chesapeake and Ohio Railway Company. That Company agreed to deliver at New Haven 60,000 tons of coal at an aggregate cost which, after deducting the market price of the coal at the mines and the cost of transportation from Newport News to Connecticut, would leave the Chesapeake and Ohio Railway only about 28 cents a ton for carrying the coal to Newport News, while the published tariff was \$1.45 per ton. suit was brought by the Inter-State Commerce Commission to enjoin the carrying out of this contract. The answer of the railway company was in effect that it charged the full rate for transportation, and sold the coal at less than market rates; indeed, at a price which involved a loss, and that special circumstances justified it in so doing. Thus the question before the Supreme Court of the United States was, as stated by Mr. Justice White in delivering the opinion of the Court, this: "Has a carrier engaged in inter-State commerce the power to contract to sell, and transport in completion of the contract the commodity sold, when the price stipulated in the contract does not pay the cost of purchase, the cost of delivery, and the published freight rates?" In deciding this question the Court reaffirms the Constitutional power of Congress to regulate inter-State commerce, subject only to expressed or implied limitations on the power of Congress by other clauses of the Constitution. In other words, it puts an effective end to the claim that has been made that this Congressional authority is a special and limited, not a general and unlimited, authority. Thus, to repeat what we said in 1904, the Supreme Court "establishes more firmly than ever the sound political and industrial doctrine that corporations deriving their existence from the hands of the people must submit to regulation by the people."

Not less important is the further virtual decision of the Supreme Court that a common carrier cannot be both a dealer and a carrier, and, by fixing a special price upon the goods which it carries, in effect underbid other owners of similar goods who are dependent upon the railway for the transportation of their products to the market. To allow this, says the Court, would allow the carrier to render the prohibitions of the Inter-State Commerce Commission ineffective. "The existence of such a power would enable a carrier, if it chose to do so, to select the favored persons from whom he would buy and the favored persons to whom he would sell. thus giving such persons an advantage over every other, and leading to a monopolization in the hands of such persons of all the products as to which the carrier chose to deal." It is not necessary that there should be an explicit provision of the law prohibiting the carrier from becoming a dealer. "Because no express prohibition against a carrier who engages in inter-State commerce becoming a dealer in commodities moving in such commerce is found in the act, it does not follow that the provisions which are expressed in that act should not be applied and be given their lawful effect." The illegality of the carrier acting also as a dealer grows out of the fact that, if he does thus act both as carrier and dealer, the provision of equable and just rates of transportation is practically made inoperative. It is interesting to note that the Supreme Court quotes in support of this principle a decision of an English court, based upon, not statutory enactment, but upon common-law principles. In the case of the Attorney-General vs. The Great Northern Railway Company, Vice-Chancellor Kindersley decided that dealing in coal by the railway company was illegal because incompatible with its duties as a public carrier and calculated to inflict an injury upon the public, and therefore the Act of Parliament granting the charter to operate the railway implied a prohibition against the company's engaging in any other business.

It is always perilous in interpreting the decision of a court to make applications of the principle involved other than those which are made by the court itself. All that the Supreme Court has decided in this case is that a railway corporation possessing general railway powers under its charter has not a right to engage in the sale of goods as well as in their transportation. It has not decided that legislation may not confer this power to exercise a double function upon either a dealer or a railway, nor that this power has not in some cases been so conferred.

But it has decided that such power is not to be implied, and, on the contrary, that without some express provision such combination of functions is illegal, not because it violates an express provision of the statute, but because it is against public policy. It would seem, therefore, clear that the Beef Trust cannot act as a transportation company; that a coal company cannot be combined with a railway company, the same corporation mining and selling the coal and furnishing the transportation; and since the illegality of such a combination depends. not upon any express provisions of the Inter-State Commerce Law, but upon the principles of the common law, and specifically upon the rights and duties of the common carrier, it would appear to be equally applicable to State and inter-State commerce. Of course it is always possible for the same men to form two separate corporations and conduct the two operations of selling goods and transporting goods under the guise of separate organizations; but it is also true that it is a great gain to the public to have the illegality of such combinations explicitly confirmed by the highest tribunal in the land, and although temporary evasions of the law are always possible, ultimate prevention and punishment of such evasion is always possible.

It is true that the Court recognizes the fact that fifteen years ago the Inter-State Commerce Commission decided that railways possessing explicit legislative authority to mine coal could not be denied that power, and intimated that this decision and the continued practice under it constitute a precedent of possibly binding authority. But it is not clear that the Supreme Court regards it as binding except as against the Inter-State Commerce Commission, or as preventing legislative enactment-Federal or State, or both—prohibiting, in such cases, the continued exercise of trading functions by a common carrier. opinion of The Outlook, no decision of the Supreme Court, except possibly the decisions in the so-called Colonial caseswhich established the right of Congress to govern our insular possessionshas been of as far-reaching importance

as this decision in the case of the Inter-State Commerce Commission against the Chesapeake and Ohio Railway Company.

Ash Wednesday

Once more the thought of the Christian world turns to the figure of the Christ in the solitude of the desert, meeting those temptations which were to test his strength, clear to his own consciousness the mission on which he came, and, through struggle, suffering, and victory, to clothe him with power as with an invisible garment. The lessons of the Lenten season strike with a new and impressive force on the conscience of a country which has suddenly awakened to its own lack of rectitude, and of a people to whom there has come, on a great scale, a conviction of sin. In the midst of an almost unexampled prosperity, fields yielding as perhaps they have never yielded before, mines contributing on a colossal scale to the wealth of the country, the channels of business choked by its volume, a great increase of comfort and an immense advance of luxury, a piling up of wealth which would have been incredible even thirty years ago—in the very heart of this material prosperity suddenly there has sounded the voice of one crying in the wilderness, and while the feast is at its height again the invisible hand that has so often recorded the doom of nations and of men has written on the wall. Other days have seemed more fortunate because less disturbed; but in the truest sense of the word there can come no greater prosperity to a people than the awakening of its con-Americans are not worse than the men of other nations; on the contrary, the standards of personal purity, of family integrity, and of individual honesty are perhaps higher, taking the whole people, than anywhere else in the world. It must not be forgotten that no nation has ever been so tempted by the things which minister to the senses, that to no other nation have ever come such opportunities of rapid accumulation of wealth, into the hands of no other people have ever been committed such colossal fortunes. That human nature has succumbed to the pressure of these appeals is not surprising; and they who sit in judgment must beware lest in passing sentence they reveal, not a penetrating insight, but a fundamental lack of a real knowledge of conditions.

Nevertheless, after all explanations have been made and every defense put in, it is a sad but most healthful experience through which Americans are passing. There have been few disclosures of calculated villainy, few colossal defaults, few infractions of the primary laws of life; but there have come to light widespread stupefying of the conscience, a confusion of moral ideas, and an acquiescence in evil conditions so general that, while great success has come to individuals, something very like failure threatens the Nation. Americans have insensibly drifted into the position in which they seem to regard their government as a colossal opportunity for making money; and the business and the government of the country are now so interwoven that nothing can save the government to its great uses and conserve the ideals of the Nation except radical severance of these two interests. The men who are trying to drive business out of public life, and to establish before the law the equal rights of all men, find themselves confronted, not simply by political bosses and corrupt politicians, but by men of the highest commercial standing. The most tragic aspect of recent events has been the fact that the prime offenders have been men whom communities have looked upon as incarnations of integrity as well as possessors of business genius.

A nation in sackcloth and ashes would disturb the conventional judgments of the world, but would attain its highest dignity. No concealment nor evasion, but searching revelation and heartfelt confession, are needed, and are fortunately common among Americans. We are only at the beginning of a revival of religion which is to express itself in a revival of personal righteousness. In every direction the movement gathers headway; out of the confusion higher standards are defining themselves; out of discouragement and abasement new possibilities of public service are reveal-

ing themselves. The pitiful tragedy of wealth gained without honor has opened the eyes of young men especially to the emptiness of mere material success; never in the history of the Nation has there been such a series of conspicuous failures brought to light as during the past twelve months. It is time for self-searching, for confession, for humility, for silence, and for prayer.

Open the Doors

One of the most striking and fruitful of modern discoveries in medicine is the restorative power of fresh air; and the out-of-doors cure is now widely adopted for a great variety of diseases. What medicine cannot do fresh air does with rapid and astonishing effectiveness. This is another step, not in the direction of the discovery of remedies, but of a rational and normal way of life; it is as a preventive of disease even more than as a healing agent that out-of-door living assumes increasing importance in the experience of men. There is no doubt that the scourge of tuberculosis, which is a plague far more destructive than cholera or yellow fever, and nervous troubles of all kinds which sap the vitality, pervert the judgment, and blur the joy of life for multitudes of men and women, have their source or occasion chiefly in living too much indoors and breathing the vitiated air of close, overheated Simply to throw the windows open is to invite health to come in, and to go out-of-doors and live is to take health by the hand. "Give me health and a day," said Emerson, "and I will make the pomp of emperors ridiculous."

Dr. Johnson once declared that a sick man is a rascal. The world has been well served by sick men, and their fortitude, resolution, and mastery of pain have written some of the most inspiring chapters in the history of human achievement. There is no doubt, on the other hand, that much of the crime in the world is due to disease; that half the misery has its root in physical infirmities; and that to the same cause is due a vast number of harsh judgments, false and depressing views of life, misconceptions of motives,

and morbid wretchedness. Health is not a luxury; it is a duty. He who lives with reckless disregard of the conditions essential to health invites disease and may, in the end, incur the guilt of suicide. Parting company with nature in over-eagerness to make a fortune or a reputation involves not only the loss of one of the great resources of life, but a diminution of the vital energy and, in many cases, the premature ending of life itself.

If living out-of-doors is essential to physical health, it is even more essential to moral health. A vast amount of the moral illness in the world is caused by too much indoor life; by keeping too much within ourselves, walking endlessly around the little circle of our own experience, questioning our own motives. trying to settle the problems of the universe from our own individual standpoint, and treating our personal conditions as if they were the general conditions under which all men live. These and a thousand other forms the disease of egoism takes on, and disqualifies men and women not only from exercising sound judgment and seeing things as they are, but from winning contentment. happiness, and sanity. The man who is perplexed by questions about his own fitness to discharge a duty or perform a task cannot solve it by thinking about it; let him set his hand to the work, put his strength in it, and he will soon discover whether he has blundered or not. And a multitude of people who are allowing their thoughts to brood continuously over their own misfortunes would find a great lifting of the weight if they would get out of themselves. quickest and most effective way of helping one's self is to help somebody else. When the invisible house in which every man lives begins to darken, open the windows, set the doors wide, and escape at once into the great world. The remedy for egoism is a greater interest in the affairs, fortunes, and happiness of some one else. The world is full of opportunities for getting out-of-doors and escaping from the prison-house of our own experience; to take the sting out of your personal misfortunes, share the misfortunes of others.

The Spectator

The penny point in character may be studied to advantage on the street-cars. The Spectator is always interested in his neighbors on the trolley or the elevated; they reveal themselves and human nature at large in many ways; just now the Spectator is holding the penny point of character in mental suspension. A woman carrying a net shopping-bag containing bulky manila envelopes entered a cross-town car and took the seat beside the Spectator. She was middle-aged, brisk, and wholesome-looking, with a mingling of the domestic, business, and professional air. The Spectator was attracted by the humor and kindliness of her countenance. His eve caught the top line of a memorandum showing through the net, "Consult at Lenox The conductor paused Library—" before her. She handed him a dime, saying, "Transfer to Fourth Avenue, please." He handed her five pennies. "Haven't you a nickel?" she asked. "Lady, somebody's got to take the pennies." She held her open purse under his eyes; it held five pennies. "You see I could have paid you in pennies. I wouldn't mind taking pennies, but I should have to pay them to a conductor on my return trip." "Nobody wants pennies, lady, but I got to get rid of 'em somehow." "Well, give them to somebody else. Let me have my dime and I will pay you exact fare in these five pennies." He handed her a nickel, less in anger than in sorrow. The whole car was smiling; from personal experience everybody appreciated the situation. The woman's eyes twinkled as she met the eyes of the Spectator. "A conductor gave me five pennies last night," she said, "and I had not time to provide myself with more change this morning. I suppose I look amiable. I get pennies very frequently. And I never said a word before because I know conductors have their trials about pennies. I receive pennies as helping my fellow-man carry his burden. Somebody's got to carry the pennies—maximum weight with minimum value." "Fourth Avenue!" called the conductor. As she went out she said, with laughing

eyes, to him, "I am very sorry I had to make you take back those pennies. I'll come better prepared next time." "Pennies ain't no laughin' matter, lady. Some folks are glad to give 'em to you because you don't want 'em. But you ain't that kind," he observed, with clearer meaning than grammar.

(49)

Waiting for a car near the Broadway car-shed, the Spectator mentioned pennies to the starter. "Here's a gentleman wants to know about pennies," the starter said to a group of conductors. They thrust their hands into their pock-"Want any for change, mister?" The light died out of their eyes when they learned that information only was "What do we do with the pennies? Pass 'em on. Everybody delighted to get 'em; say pennies is just what they've been wanting all their lives. We give 'em mostly to women and colored people—that's the kind gives 'em mostly to us." "On some lines, during hours when the leisure class travel, few pennies are received or given. The ladies that carry the pretty gold and silver purses don't hand out pennies," said the starter. "We wish the public knew how we respect people who hand us exact fares in silver," one conductor observed. "We try to be polite and careful, to exercise discretion and judgment." "I won't give five pennies flatthat is, if anybody gives me a dime I won't hand 'em back five pennies. a quarter, I work out five pennies on that. You see, mister, there are people who save up pennies to give conductors. They think it's more economical to pay their fares in pennies." "It ain't easy for some people—working-girls who go early in the morning—to turn their pennies into silver for us," one of a just mind hastened to state.

8

"I pay pennies—when I must pay pennies—to the elevated," a school-girl confided to the Spectator. "The man at the window doesn't have to carry pennies round in his pockets. I think it's real mean to pay pennies to a surface-car conductor. Because people say women always pay pennies, I never pay pennies if I can help it." "I never pay

pennies," the business woman asserts; "business women never pay pennics. But it jars me to hand out a quarter and get twenty pennies back, as sometimes happens." "Do you know," said the Spectator to the school-girl, "that the real trouble for the surface conductor and the man at the window is that their companies will not receive pennies from them?" "Oh, no, I never knew that. How mean of the companies!" "No, not exactly. As the public gives, the public must take. If a company received pennies, it would have to employ an extra force to count them, and that would not pay." "Well," said the school-girl philosopher, "when you come to the truth of it, nobody seems to be to blame for anything that goes wrong. Ignorance is at the bottom of the wrong things."

6

The Spectator paused before the window of the Fourteenth Street elevated station. "Do you take in many pennies?" "I take in over two hundred dollars daily at this window; over ten dollars in pennies." "How do you dispose of the pennies?" "That's easy," interrupted a woman who was asking for a fare; "he gives them to women," and carried off her portion. "Return 'em to the public," said the man at the win-"The public doesn't like to take as good as it gives. Why, you wouldn't believe it! folks sometimes throw pennies back at me." "Who gives most pennies?" "Women-seem to think traveling's cheaper if they pay for it in pennies. Women save up pennies to pay fares with. Pennies are legal tender up to twenty; I can give and must accept that many. To-day a woman offered twenty-five for five tickets and I accepted them; we avoid unpleasantness in serving the public as far as we can. I wish the public realized how much better it would be all around if exact fares were offered during rush hours; while you're making change for people who have time to wait for it, a business man or woman misses his or her train."

(♣)

A little man with silvering hair and a benevolent face dispensed light on penny points from a station window higher uptown. "It makes people mad to take pennies," he said, sadly; "it works hard feelings." "Who pays you most in pennies?" He came up gallantly: "Both sexes. I do my best not to pay back." He held an envelope to view. "I have fifty pennies in that. When I go to lunch, I pass a stall where milk and coffee are sold at odd cents a glass or cup; they take fifty pennies off me daily. Most of us have devices for working off pennies." "Pennies would not be paid if people knew how much trouble they make," the Spectator sympathized. The little man shook his amiable head: "Oh, I don't know. If you stood at this window all the time, you'd lose faith in human nature." "All along of pennies?" "All along of pennies. Why, a man will give me a dime and I'll push him a ticket and five pennies; he'll push the pennies back and say, 'Another ticket, please,' and walk off looking as if he were proud of himself for getting Yesterday a young the best of me. woman handed me a quarter. I shoved her a ticket, a dime, and ten pennies wouldn't have done it but I was hard pressed and knew she was going right down to the stores. Before I thought she had so much as caught sight of the pennies, she exclaimed: 'Oh, I believe I've given you my counterfeit quarter that I keep as a sort of keepsake. Let me have it back!' I shoved back the quarter I thought was hers fast enough. She hardly looked at it, shoved five pennies under my nose, and walked off with her head in the air. Oh, human nature is full of twists and turns, as you'd learn if you stood for years at this window." "Perhaps fewer people will offer you pennies and more will accept them pleasantly of you hereafter," said the Spectator, optimistically; "people when told of their mistakes usually correct them." "Who's to tell them?" "I As the Spectator walked off he thought he heard the little man murmur solicitously, "Maybe he has hallucinations about pennies; lost his mind thinking about pennies. Pennies are mighty little things, but they show you some mighty big things about people,"

THE AMERICAN FOREIGN SERVICE

BY HUNTINGTON WILSON

Secretary of Legation of the United States at Tokyo

THERE is evident a growing sentiment among Americans in favor of reorganizing and improving the foreign service, diplomatic and consular, and placing it upon a stable basis. Indeed, this feeling has become so general and so strong that but for our extreme conservatism something would have been done in that direction before the present time.

The diplomatic service is the machinery by which the relations of our Government with other Governments are It is the spokesman of our carried on. policies in the council of the nations; the channel through which flows peace or war. It is the eyes and ears of our Government in our foreign affairs; and it is the every-day means of attending to our rights and obligations towards other Governments and peoples. A hermit nation needs no diplomacy; but once a nation abandons isolation, the efficiency of its diplomacy is a matter of serious concern to every citizen.

The consular service is the machinery for carrying on, improving, and increasing foreign commerce. First, there is an enormous amount of routine business. For all goods imported into the United States invoices must be authenticated at our consulates at the ports of export or places of original shipment. Consulates are the custodians of the ship's papers of American vessels while at ports within their districts. They discharge sailors, assist destitute or sick seamen, adjust difficulties between ships' captains and their crews, and generally extend the control of the home Government over the merchant marine in foreign ports. Marriages of Americans in foreign countries must be witnessed by the Consul. Deceased Americans' estates in foreign lands are, to a degree varying in different countries, under consular protection. Deeds, powers of attorney, protests, affidavits, patent applications, and other instruments executed abroad to be effective in the United States, are attested at the consulates. Such are the ordinary administrative and notarial consular duties. In those countries where extraterritoriality is in force the consular officers exercise a much wider administrative function. There the American Consular Court is the only forum in which an American can be pursued by civil or criminal law.

After giving some idea of the variety and responsibility of the consular function, we come to what is to-day the allimportant object of that service. That is, the extension and increase of American business by opening up, widening, and developing fields for our export A consular district generally comprises all that part of the country in which a given consulate is situated which is nearer to it than to any other American consulate. It is the duty of the consul to make a deep and special study of the industrial and mercantile conditions existing in his district. He must know what the country needs or would take in raw materials, in commodities, and in manufactured articles. He should learn how these needs are being supplied, with particular attention to those of them which the American producer-farmer, miner, manufacturer, or merchant—might supply. He should investigate and report as to whether the American import could not, by a change in form or a variation in manufacture, by a different method of packing, by more convenient accommodation in payment, or in any other way, be brought into greater demand and American trade be thus increased.

Each consular district may reveal a peculiar phase of the general import

possibilities of a country. Hence, general reports are made by an official who looks over the field as a whole. These reports are made at consulatesgeneral, and sometimes also at embassies and legations. Of course the capital of a country affords the best facilities for obtaining from official sources information bearing on trade. Also, in some countries government contracts are an important item in the competition for import orders. Therefore it may be wise for us, as some European Governments have done, to appoint commercial attachés to some of our embassies and legations.

Our consular service, then, exists to facilitate and promote the material and personal interests of the American people in foreign countries. Our diplomatic service adds a care for these same interests to its duty to protect and further America's political interests in the world.

The Department of State is charged with the duty of making the diplomatic and consular services of the greatest possible use to the Government and people. It is not generally realized how large a number of officers the State Department has under it in the service abroad, nor how vast and varied is the volume of its business. It has a personnel smaller and more poorly paid than that of the Foreign Office of Great Britain; but, besides being the American Foreign Office, it has a number of other duties superadded. The Secretary of State is keeper of the seal of the United He publishes the Federal laws of the land. Contentious matters between foreigners and the State sovereignties of the Union at times give rise to questions between those governments and the governments of foreign countries. All these have to be settled by elaborate domestic correspondence between the State Department and the Governors of our States, other departments, and various officials. So that functions corresponding in other countries to such offices as Keeper of the Seal, Chancellor of the Empire, etc., devolve upon the one Department. What with our new colonial possessions, it seems likely that the scope of the State Department's work may before long be still further extended. Yet the Department of State has a very small personnel and very small appropriations. The wonder is how its handful of officials acquit themselves so well in grappling with so enormous a volume of business. Certainly high praise is due them.

The fact is that all three components of the foreign service, that is, the Department of State and the diplomatic and consular services under it, were founded long ago on a small scale, just after our emergence from colonial days. They can never catch up with the country's present needs unless the will of the people express itself through Congress in the form of the required legislation, and Congress take a deeper interest in the work of the foreign service.

This brings me to one of the most distressing difficulties of our system. I refer to the lack of any constituted channel of communication for keeping Congress and the foreign service in sympathetic touch and effective co-operation. In other countries this undoubted need is supplied by a parliamentary secretary; or the Minister for Foreign Affairs speaks on the floor of the House. With us there are the President's occasional messages. Congress sometimes calls for correspondence when some question has become acute. Or, suppose a Senator or a Representative or an official of the State Department to be greatly interested in a piece of legislation touching foreign affairs, or in a treaty to be negotiated; he may by personal effort have a number of conversations which will greatly help both the Senate or Congress and the Department. But there is no sufficiently continuous keeping in touch between the Senate, the House, their committees. and the State Department; and the matter is too important not to be thoroughly provided for. Why should not an Assistant Secretary of State be charged with this duty?

Because of the heterogeneity of its business and the numerical inadequacy of its personnel, the State Department has been irreverently compared to the former Chinese Tsungli-Yamen. Our diplomatic and consular services have been, with less irreverence and more truth, called the "catch-as-catch-can sys-

tem." There is enough truth in this pessimism to suggest that there is much room for improvement, and that the time is ripe and the way open for framing and putting into operation an ideal foreign service.

The Department needs a larger personnel to do its great intellectual work, and a more logical division of work. present, in the Diplomatic Bureau the countries of the earth are apportioned for working purposes alphabetically. Yet it cannot be said that a knowledge of Cuba and Costa Rica is particularly useful to the men who must study the intricacies of Chinese policy. The Diplomatic Bureau should be divided into sections on some politico-geographical basis of reason. Several new bureaus and sections should be added. And, as said before, some official should be charged with keeping the Department in touch with the whole Congress on legislation respecting foreign affairs, and with the Senate on treaty matters.

The reform of first necessity is the extinction of the "spoils system" in filling offices in the foreign service. Here civil service is absolutely indispensable; but the application of it requires very careful working out.

Inefficiency in the foreign service may be divided, according to cause, into two classes. The first is inefficiency due to lack of natural qualifications, to inadequate professional education, and to want of experience. These are the vices of our unsystematized service. The zeal of a man trying to do a difficult thing quite new to him is sometimes its saving grace. The second is inefficiency arising from apathy and indifference. is the vice of a thoroughgoing, closed civil service. Our problem is how to get the natural qualifications, the special education, and the experience, and at the same time to inspire zeal in the service.

Examinations will insure the special knowledge, a permanent service will supply the experience, promotion for meritorious work will secure the zeal. How are we to obtain the best men? Every college man knows that the men who pass the highest examinations are by no means always the ablest men in

the class. Especially in diplomacy, a number of very intangible qualities are wanted. Tact, address, quick perception, an analytical mind, balance, and self-control are some of the natural qualities a good diplomatist has. These should therefore be sought in the young candidates for the service, and obviously they cannot be detected by a written examination.

A famous Russian Minister for Foreign Affairs emphasized the indubitable importance of this personal element. It was his custom to have all the candidates who had successfully passed the diplomatic service examination call upon him next day. He then selected from among them the candidates to put into the service; and he is recorded as saying that his decision was based rather upon the impression each candidate personally made on him during the call than upon the relative merits of their examination papers.

Why should not the Secretary of State, perhaps assisted by a small board, select from among the successful candidates those to be put into the service after the examinations each year—the choice to be made after an informal and verbal examination of the men who had successfully passed the main written one?

Now that the days of the telegraph have made the envoy rather his Government's spokesman and advocate than its plenipotentiary statesman, some people too greatly minimize his duties. Surely it behooves us, as a practical people, to have for our Government the best possible spokesmen and advocates. In private life his personal abilities leave one advocate in the law to starve, while another's bring him a huge income. Success or failure in the Government's foreign affairs depends enormously much more than people realize—upon the skill or the bungling of the Government's advocates abroad. And these are its diplomatic representatives.

For efficiency in a consular officer the personal factor presents somewhat fewer difficulties, yet it is questionable whether an examination should be the sole criterion for the admission of men eligible to all grades. Although the two services have a number of things in common;

and what is true of the one is often to some extent true of the other, what next follows applies particularly to the diplomatic branch.

A charge which may be brought against an organized foreign service in which men spend their lives, except for occasional leaves of absence in going from post to post in foreign countries, is that they sometimes lose touch with the ideas of their own country. They are too long away from home. There is, however, a ready means of removing this danger.

The successful candidates for the service should first pass a year or more as clerks in the State Department, learning, from the big end, the practical work of their profession. These young men would be distributed in the bureaus and sections where the work would teach them most about their future duties, whether consular or diplomatic, and would be required to familiarize themselves with the general work of the Department.

Next, these clerks would be sent abroad to serve as attachés at embassies or legations, or as clerks in consulates, this depending upon which service they had been examined for and entered. Later, they would be transferred from one post to another, and, if they did good work, gradually promoted. In their respective services they would become third secretaries of embassy or legation, second secretaries, secretaries, and so on; and, in the consular service, higher grades of clerks, consular agents, vice and deputy consuls, consuls, consuls-general.

In connection with the regular diplomatic and consular service examinations there should be examinations for positions as student interpreters. A few years ago student interpreters were attached to our legation at Peking, and that was an admirable innovation. should be extended, however, at least to our legation in Japan, and perhaps also to that in Turkey. The written language is practically the same in China, Japan, and Korea. These student interpreters, after an apprenticeship in the State Department, would be sent out and attached to the legations in the Ear East. There they would spend several years in mastering the difficulties of the Oriental languages. After that they would be prepared to join the staffs of the consulates in China, Japan, and Korea as clerks, and so enter on a career in the Oriental consular service. The interpreters of our legations and their assistants would also be drawn from this body.

Now we come to the above-mentioned safeguard against a tendency to what may be loosely called expatriation. The plan which follows is most of all desirable because of the great benefits it carries with it.

It is difficult to gainsay that a man can do better work in the service abroad if he has first served in the Department. at Washington. It also seems evident that it would be useful to have in the Department men who had made recent special studies of the political and trade conditions in various foreign countries. The suggestion, then, is that a mobility and interchange of posts be established, to a certain extent, between the Department of State and the diplomatic service, and perhaps also, in certain bureaus and sections, between the Department and the consular service. A parity of grade could be fixed between the posts in the Department and the posts abroad. For example, the different grades of clerks. the chiefs of section, the chiefs of bureau. and the assistant secretaries might correspond to attachés, to grades of secretaries of embassy or legation, to ministers resident, and to ministers plenipotentiary. A limited shifting between the two ends of the service could be ordered from time to time by the Secretary of State. Among other things, this system would give to the heads of the service a more intimate knowledge of the abilities of their personnel; and it is safe to say that in the long run it would be of great use to the Department and benefit to the diplomatic service.

Fairly frequent shifting between posts abroad is also desirable, and transfers should as far as possible invariably accompany promotions. For considerations which, if somewhat abstruse, are none the less cogent, it is best that a secretary should be transferred when promoted rather than be promoted to be minister at the same post. The two

official characters of minister and secretary, and the subtle relations attaching to them, are different. Each position occupies a certain place in the mind of the local official circle; and these associations are not to be suddenly thrown off or assumed. An important reason why three or four years is generally long enough to leave a man at the same post is that he almost inevitably becomes somewhat "stale." His observation becomes less keen. Also, at difficult posts an energetic representative is not unlikely to wear out his welcome and so lose much of his usefulness. Furthermore. frequent transfer gives wider experience and so increases efficiency. With this system each official would be commissioned by the President in a particular grade, and the Secretary of State would designate, from time to time, the post he should fill. From every point of view, a more mobile diplomatic service, including limited interchange to the State Department, has much to recommend it.

A closed service, in which a man has only to live in order to be steadily promoted and finally retired with a pension, tends to induce apathy. What we want is a service in which every man who gives his best years and energies to the work will be sure of a life career, and, at the end of his career, a pension. Only those who do signally fine work should expect to be rewarded with ultimate promotion to the highest grades. In this way justice is meted to faithful service and a reward is in store for brilliant service.

The best pension system would probably be to make retirement optional after, say, twenty-five years' service, with a pension computed on the salary of the grade from which the officer retired. The pension could be increased proportionally to the excess of the period of service rendered over twenty-five years. In private life it is deemed a hard lot when a man who has given the best twenty-five or thirty years of his life to a business or profession cannot have accumulated enough to support him during his declining years. And if the foreign service is to have the good men it needs, their livelihood must not be made too precarious.

Nor would it be necessary to have an absolutely closed service. There is every reason why, with an organized service, the President should still have the power to appoint an ambassador or Minister from outside the diplomatic service. The pre-eminent talents and conspicuous fitness of some countryman of ours, or the special nature of some mission to be carried out, may at times point unmistakably to such a selection.

Our ambassadors and ministers receive relatively small pay and no allowances worth mentioning, and are not provided with houses. Their colleagues representing other Powers receive generally better pay, besides funds for the costly and necessary outlays for "representation," and permanent buildings owned by their governments, in which to reside during their missions. truly democratic American should be shocked to realize that, because of our penury in this matter, only very rich men can possibly uphold the dignity of the United States at certain capitals. The very undemocratic result is that men of moderate fortune, however talented, cannot be appointed to, nor could they afford to accept, those posts.

American travelers are constantly chagrined to find their legations and consulates abroad housed in a haphazard manner, comparing very unfavorably with those of other countries. Our Government owns legation buildings only at Tokyo, Peking, Seoul, and Bangkok. The ownership of these was practically forced upon us by the peculiar conditions existing in those countries. Similarly, we possess a few rather inferior consular premises. Let us see what other countries do-countries which place importance on foreign policy and its corollary, foreign commerce, as, for example, Germany and Great Britain. In every capital, in every port or commercial center, they aim to have the eye met by an embassy or legation or a consulate substantial, permanent, and architecturally good—which stands in a foreign land as a reminder of the dignity, the strength, and the enterprise of the country whose flag flies over it. And then one finds (if, indeed, one can succeed in finding them) the American embassy

or legation, shabby or creditable, according to the purse and generosity of the representative, and the consulate sometimes a dusty second floor in some back street. Is this what the American people want?

I have outlined a number of points for a reorganization which I believe would be entirely practical and feasible, and would vastly ameliorate the service. There are many minor reforms which can hardly be taken up with any enthusiasm while the service is left in its present unsettled condition.

A number of Senators and Representatives have done hard work and have introduced bills which it was hoped would place the service on a sound footing.

But the ideal foreign service for which the way is now open needs for its accomplishment the support of an active, not passive, public opinion; and it needs the co-operation of the Senators and Representatives interested with the President and the Secretary of State, and with some of those who have studied the service from within. The foreign services of all countries must be studied and What is good must be examined. adopted, or what is better must be devised. Then will a bill be framed and passed which will give us the efficient foreign service that a great commercial world power like the United States has the right and the obligation to possess.

Tokyo, Japan, August, 1905.

THE PRINCIPLES OF MUNICIPAL OWNERSHIP

BY ROBERT DONALD

Editor of the "Municipal Year Book," etc.

MOULD a municipal corporation control the communal services of the people it represents? If so, in what manner and to what extent? Should the control be partial, by regulation, or complete, by operation? What are the chief considerations which should guide a city's action? What are the main principles upon which the system of municipal ownership rests? These and other questions have now to be considered by students of city government. The rapid growth of cities, and the still faster development of social needs in every community, create new problems and call for new methods of administration. Government is established in cities, as in States, to maintain order and to promote the well-being of the citizens; but a city or smaller urban aggregation has its own problems, brought about by the close community of interests which exists among its people. Collective action has become inevitable, and the chief municipal question of the day is, to what extent should the municipality regulate the services which are elemental necessities in every civilized community?

ſ.

City public services may be roughly divided into three main classes.

First, we have those services which are intended to maintain order and prevent crime; look after the health of the people; enforce sanitary regulations; protect the people as consumers in cases where they are not able to protect themselves, such as by checking the adulteration of food, checking weights and measures, etc. Under the same head come the police and law departments; the regulation of traffic; the management of the streets; the control of buildings; protection against fire; maintenance of parks and pleasure grounds with facilities for recreation, and the provision of education. These protective and administrative services vary in extent, according to the needs of the community and the views of the local governing authorities; but they are all duties which naturally fall on public authorities; otherwise they would either not be done at all, or only very inefficiently carried out. They are services which are maintained by taxation, not carried on for profit.

The next class of civic duties includes

services which may be made remunerative, but not necessarily with advantage to the people; such as water supply, public baths, and garbage and sewage disposal. They are services of public utility which are also necessities, and some very good reasons must be found why they should be left in the region of private trade.

The third class of services include undertakings which are not absolutely essential to every individual, but at the same time are required for the comfort and well-being of the community as a whole. These are works which are remunerative, or should be so, and are therefore considered by many economists to be outside the legitimate functions of governing authorities, and belong to the sphere of private enterprise. I refer to such undertakings as gas and electricity supplies, street railways, the provision of hydraulic power, and telephones.

П

These services cannot be established without the municipality having much to do with them. They must use the public streets for mains and wires, and, in the case of tramways, for rails. They cannot carry on their work without disturbing the traffic and interfering with public convenience. Moreover, the municipality is one of the chief consumers of artificial light. These factors show that communal industries cannot be established without co-operation in some way with the local governing authorities. Another element which brings them still nearer the sphere of municipal functions is that they are, in their nature, monopolies. It is not to the advantage of the public that there should be rival competitive electricity and gas supplies in every street, and it is almost impossible to have competitive street railways. Where competitive services of these kinds have been established they have existed only for short periods. The inevitable tendency is toward consolidation, and monopolies are established. Obviously, it is in the interest of the citizens as users that there should be no wasted capital sunk in duplicating mains which are not necessary, or in establishing superfluous works, as the capital has

to bear interest or return a dividend obtained by imposing high rates and charges.

It is because these services become in the end monopolies, and are always profitable, that capitalists are so anxious to control them. We do not find that capitalists and contractors are anxious to compete for the management of the unremunerative services, such as disposal of sewage or collection of garbage. where the contract would be allotted to the one who made the highest offer, and where the opportunity of profit would be small. At one time the collection of cities' waste-garbage, refuse, streetsweepings, dust, etc.--was a profitable enterprise. In many English cities contractors were ready to collect the material and pay for it, in order to use it for brick-making. Others were ready to cart it away for filling up waste land. For many years, however, these departments of municipal housekeeping have ceased to provide the elements of profit. It is at the option of the municipality whether it will employ contractors to collect and cart its wastes, or do it by direct employment. In mediæval times every citizen was his own scavenger; but under modern conditions garbage and refuse can be economically removed only by an organized system under one authority. The object can be best attained, for many reasons, by the city keeping the work entirely in its own control. A contractor who would undertake the cleaning of the streets or the collection of garbage would always have in view the making of profit, while the main purpose to be served is efficient cleanliness. Clean streets improve the appearance and health of a city and add to its attractiveness. Experience has shown that the watering of streets, scavenging, and the collection of refuse can best be done by a department of the city service. In British cities, when scavenging and refuse collection were carried out by contractors, the employees were paid only nominal wages, and levied blackmail on householders, who were accordingly compelled to pay for the same service twice over, having done so first in their local taxes.

The advances made in the utilization

of waste in recent years enables a municipality to dispose of its garbage in many ways. There are only a few places which have waste lands in which to dump it, or which can drop it into the sea—unprofitable means of disposal. Garbage is now used on municipal farms; it is cremated, the fine dust is used for concrete-making, the clinker is crushed for road-making, and used for other purposes. The consumption of garbage in refuse destructors was soon found to create another waste product namely, heat. That heat is now utilized for various purposes, such as providing steam for disinfecting stations connected with the sanitary department, for heating water for baths, and for raising steam for electric generating stations. Having the matter in its own hands, the municipality can accumulate all the garbage from other departments, from markets, slaughter-houses, etc., and put it to the most economical advantage. For example, the city of Manchester has one central department to which are sent all house, trade, and street refuse, the garbage from the markets, and the offal and wastes from the slaughter-houses. The department owns and works two large farms, where matter of manurial value is utilized. It is a great manufacturing establishment, making soap, oil, tallow, etc. It has workshops in which it builds the railroad wagons for carrying manure to its estate; it makes vans, bricks, and implements used in the department. employs two thousand men, and its income from sales amounts to \$250,000 a year.

Glasgow gives another example of the profitable utilization of refuse and garbage by a central city department. The garbage is all sifted, some burned in destructors, refuse from which goes to making mortar or concrete. It owns farms which it has reclaimed from bogland, and sells its surplus manure to farmers in the counties surrounding Glasgow, and employs a thousand railway wagons in distributing its produce.

Under no system of contracting could the same economical disposal be possible. The chief objects of the City Council in all matters of municipal housekeeping are to combine cleanliness and efficiency with the profitable utilization of waste products. Much has yet to be done before we get the profitable deodorization of sewage, which too often now pollutes rivers; but a great deal of progress has been made in this direction by the using of sewage in connection with irrigation farms, and for other purposes.

Public baths are rarely regarded when municipally owned as commercial institutions, and if they are they fail to fill their proper function, which is to provide opportunities for healthy service and cleanliness to the poor, who have no baths in their own homes. Baths are also necessary for instructing schoolchildren in swimming. The more popular baths are made, the more useful they become, and there should be in every community a certain number of free baths for the poor and for the young. Fair charges are rightly imposed for the use of Turkish, Russian, and other special baths, now generally attached to municipal establishments.

Public wash-houses and laundries are established in the interests of the health and comfort of the poor in tenements where laundry facilities are inadequate, but are not generally necessary, as private enterprise provides adequate facilities.

Markets are among the oldest municipal institutions in the world. Fairs and markets originally occupied the public streets and had to be regulated by the governing authority. City ownership of markets provides consumers with the best and cheapest means of distributing food, curtails intermediary profits, and makes inspection to check quality and weight easy.

London is one of the few large cities which still suffers the inconvenience inseparable from the private ownership of markets. Covent Garden market, the chief distributive center for fruit and vegetables, is the property of the Duke of Bedford. Under an ancient charter, the dead hand also punishes modern London, passing down to it the private ownership of the chief East End market. Lord Portman does not consider his dignity impaired by the possession of a potato market. The meat markets in London are munici-

pal, but are limited almost entirely to wholesale business; and the same applies to the fish market, which belongs to the municipal corporation of the old city. Food is artificially increased in price by the inadequate market system and the profits of middlemen.

In Paris, on the other hand, a model market system exists, the effect of which is to distribute food cheaply among the people and to lower the difference in price between the producers and consumers. There are great central "halles" for wholesale business, and over sixty retail markets—many of them covered—for retail trade. All these markets are municipal possessions.

Slaughter-houses are akin to markets, and give a better illustration of the advantages of municipal ownership. The principles in view are not precisely the same. The chief aim of ownership in the case of slaughter-houses is the protection of the people's health. Markets are generally made self-supporting and profitable; the hygienic advantages of public slaughter-houses outweigh the commercial. Only under a system of centralized slaughter-houses can meat be properly inspected. Take London and Berlin by way of illustration and contrast. In London there are over a hundred privately owned slaughter-houses, scattered about in the midst of private dwelling-houses in buildings ill adapted for the purpose. Efficient inspection cannot be carried out, cold storage does not exist, the economical utilization of offal is impossible. Meat is conveyed about the streets from the numerous slaughter-houses in open carts. Berlin, on the other hand, there is one municipal slaughter-house for the whole of the city. A staff of trained veterinary surgeons are attached to it, who examine the animals before they are killed, and subject the meat to microscopical examination before it is offered for sale. It has to be stamped as sound before it can be put on the market; it can be conveyed only in specially built and covered meat carts; adequate cold storage is provided: all the offal and wastes are properly utilized in a way which is possible only at a large establishment.

Water supply, it is generally recognized,

should not be subject to the exigencies of profit-making for stockholders. The principle involved is nothing less than the health of the whole community; but where corporations own water supplies, as they did in London until recently, it was only when the city was threatened by a water famine that they could be dislodged, and they were only got rid of by the payment of double their capital expenditure, so that the future municipal supply has an inflated capital.

III.

I have now reviewed the attitude which advocates of municipal ownership assume towards the least industrial and commercial of communal undertakings. I will now deal with the more industrial, which raise serious contentions.

What are the principles which should guide municipal action with regard to the larger and more profitable services, including street railways, electricity and gas supplies, telephones, etc.?
